Penicillin therapy was begun shortly after the laboratory studies were reported. During the first twenty-four hours the patient received 32,000 Oxford units of penicillin given as previously described. During the second twenty-four hours he received 24,000 Oxford units. During the third twenty-four hours another 24,000 Oxford units was administered and during the final twelve hours of treatment 12,000 Oxford units, the total duration of treatment being three and a half days. Five and a half hours after the institution of treatment the patient stated that the abdominal pain and soreness which had been very distressing had subsided completely. He continued to have some perineal distress and the prostate was quite tender on examination. Forty-eight hours after the institution of treatment the prostate was less tender and it was approximately half the size it had been previously. The patient had little difficulty in urinating and stated that he felt entirely normal. His temperature did not rise above normal after the first twenty-four hours of treatment. When forty-eight hours of treatment had been completed cultures of the urine following prostatic massage did not reveal any gonorrheal organisms. Two subse-

quent cultures were also entirely negative. The patient was allowed to be up and around the hospital but did not receive any more therapy after treatment for three and a half days. Two days later he was dismissed. He was free from symptoms and the final culture of the prostatic urine after massage was negative. The routine urinalysis gave completely negative results except for the presence of four pus cells per field.

CASE 3—A youth aged 18 was admitted with a complaint of a urethral discharge which had persisted for four months. The urethritis had developed two days after exposure, and treatment had been instituted immediately following the diagnosis of gonorrheal urethritis. The first course of treatment consisted of sulfathiazole for twelve days. His dysuria and urethral pain were relieved but the discharge continued. Subsequent to this he had a course of twelve days' treatment with sulfanilamide. There was no diminution of the urethral discharge and bacterial cultures remained positive. A third course, which consisted of sulfanilamide, then was given. Following this he was treated for two and a half months by means of sulfathiazole given in courses with short rest periods. There was no improvement. Finally he received local urethral instillations of mild protein silver.

At the time of admission there was much urethral discharge. The prostate was slightly enlarged and quite tender. The remainder of his physical examination gave essentially negative results. The routine urinalysis showed albuminuria grade 2. The microscopic examination revealed occasional erythrocytes and pyuria grade 4. The concentration of hemoglobin was normal and the flocculation reaction for syphilis was negative. The leukocyte count was 9,600 per cubic millimeter of blood. Smears of the urethral discharge and chocolate blood agar cultures were both positive for *Neisseria gonorrhoeae*.

Penicillin therapy was instituted as soon as the diagnosis of gonorrheal urethritis and prostatitis was confirmed. During the first and second days of treatment the patient received 32,000 Oxford units of penicillin per day. The third day he received 28,000 Oxford units, and during the first twelve hours of the fourth day he received 1 liter containing 12,000 units. Twelve hours after the initiation of treatment the patient stated that the dysuria associated with urination was practically gone. At this time there was still a slight amount of urethral discharge. However, the patient stated that it was less than he had noted for one month. Except for a slight urethral discharge he felt practically normal by the end of forty-eight hours' treatment. At this time bacterial cultures of the prostatic secretion and first urine were entirely negative. Another similar specimen obtained twenty-four hours later did not reveal any *Neisseria gonorrhoeae*. The microscopic examination of the urine revealed between 20 and 30 cells per microscopic field. The patient was dismissed. A recheck examination seven days later did not reveal any evidence of gonorrheal infection and bacterial studies again gave entirely negative results.

SUMMARY

We have studied experimentally the antibacterial activity of penicillin against several strains of *Neisseria gonorrhoeae* isolated from patients in whom the infection was completely resistant to what might be considered adequate treatment with sulfonamide preparations. These strains of organisms are inhibited completely in fairly high dilutions of an active form of penicillin. Bacterial cultures reveal that the number of organisms is decreased greatly at the end of one or two hours' contact with penicillin. Between the second and third or third and fourth hours in contact with penicillin no viable organisms were found. This experimental evidence immediately suggests that penicillin should prove effective in the treatment of clinical infections due to these sulfonamide resistant bacteria.

The complete absence of toxicity following the intravenous administration of pyrogen free penicillin, the lack of any discomfort to the patient and the rather rapid disappearance of clinical symptoms have been observed in three cases of sulfonamide resistant gonor-

rical infections. Because of the limited amounts of penicillin available we feel that penicillin therapy should be reserved and studied further in those cases in which the infection is resistant to the accepted forms of treatment now being used. In all the cases reported, in addition to the clinical response noted negative bacterial cultures were obtained sometime between seventeen and forty-eight hours after the institution of penicillin therapy.

INTRAPULMONARY KLEBSIELLA PNEUMONIAE INFECTIONS

AN ANALYSIS OF THE LITERATURE REPORT OF
TWO UNUSUAL CASES WITH RECOVERY

SAMUEL A. JAFFE, M.D.

NEW HAVEN, CONN.

In 1882 Friedländer¹ announced the discovery of a micro-organism which he believed to be the cause of lobar pneumonia and which in his original communications he described as a micrococcus. Since this time many reports of infection due to *Klebsiella pneumoniae* (commonly called Friedländer bacillus) have appeared in the literature especially during the past twenty-five years. A review of these papers as well as of the popular textbooks of today, makes it evident that most of the attention has been focused on the pulmonary lesions with their complications. The literature dealing with extrapulmonary *Klebsiella pneumoniae* infections is scanty and has not been correlated. This has prompted the writing of this paper along with a desire to report 2 unusual cases with recovery and the use of sulfadiazine therapy in 1

ETIOLOGY

Morphology—During the first few years following the discovery of the organism there was much confusion owing to a superficial resemblance between Friedländer's organism and *Diplococcus pneumoniae*. However in 1886 Frankel² and Weichselbaum,³ by their careful researches were able to show that the 'micrococcus' of Friedländer was really a short encapsulated bacillus. Since this time enough data have been accumulated so that the morphologic characteristics can be agreed on. *Klebsiella pneumoniae* is a short, gram-negative plump rod with rounded ends and is surrounded by a large capsule. The organisms are often relatively small and arranged in pairs. The average measurements are from 0.5 to 1.0 micron in width and 1 to 3 microns in length. Forms approaching both extremes may be encountered in one and the same culture. On prolonged cultivation they may become pleomorphic and grow out as long rods or filamentous or even club shaped bacilli. They are nonmotile and possess no flagella. Spores are not formed. The bacillus is characteristically surrounded by a well developed capsule, which is most perfectly demonstrated in preparations taken directly from some animal fluid, such as the secretion or exudate from infected areas.

Physiology—The organism is easily cultivated, growing readily on all the usual culture mediums. Growth is most rapid at a temperature of 37.5°C but occurs

also between 12 and 45°C. It is aerobic and facultatively anaerobic. The growth on agar is very characteristic appearing glossy, smooth and viscid. The colonies are large, grayish white and extremely mucoid. From the papers of Osterman and Rettger⁵ one finds that the *Klebsiella pneumoniae* group is an extremely variable one and is most apt to be confused with the coli-aerogenes group. These authors have done considerable work in the differentiation of these groups.

Classification—*Klebsiella pneumoniae* is known by many names. Various authors have referred to the organism as the Friedländer bacillus, *Bacillus pneumoniae*, *Bacillus mucosus capsulatus*, *Pneumobacillus* and *Bacillus encapsulatus pneumoniae*. Juhanelle in 1926⁶ and again in 1930,⁷ by the study of agglutination and precipitin reactions, was able to distinguish three types A, B and C. All others were placed in a heterogeneous group X. It is quite probable that in the future group X may be further broken down, just as was group IV of the pneumococcus. *Klebsiella pneumoniae* A is by far the most frequently seen, B is immunologically related to the pneumococcus type II, the C group appears infrequently and is much less virulent than the first two.

Distribution—Ford⁸ states that *Klebsiella pneumoniae* is widely distributed in nature, as it has been shown to exist in the soil, in the air, in dust, in mud and in canal water. It also appears to be a rather frequent

Primary Sites of Infection in One Hundred and
Twenty-Eight Cases

Primary Site	Number	Per Cent
Gastrointestinal tract	61	31
Genitourinary tract	50	25
Biliary passages and liver	46	23
Lungs and upper respiratory tract	25	12.5
Miscellaneous skin and meninges	10	5
Vagina, uterus and adnexa	6	3

inhabitant of the human body both in the respiratory and in the intestinal tract. Bloomfield¹⁰ reports that 58 per cent of normal persons have the bacillus present in the respiratory tract—most frequently localized in and about the tonsils. Dudgeon¹¹ states that the organism is found in the intestinal tract of 55 per cent of normal persons.

SITE OF PRIMARY INFECTION

Although in the minds of most physicians and in textbooks the organism is primarily associated with pneumonia or other infections of the respiratory tract, Baehr, Schwartzman and Greenspan,¹² in a report of 198 cases from the Mount Sinai Hospital in New York, claim that this conception is wrong. They make the statement that the respiratory tract is a less common site of primary infection. The primary sites found in the 198 cases reported by them are given in the accompanying table.

From the table one may readily see that the intraperitoneal combination of gastrointestinal and biliary tracts account for more than 50 per cent of the cases. The lungs and upper respiratory tract, including the pharynx, tonsils, larynx and nose, in this series of cases appear as the primary sites in only 12.5 per cent.

PREDISPOSING CAUSES

Listed in various textbooks and papers the main predisposing causes are alcoholism, trauma and submergence. In reviewing the latest cases diabetes mellitus appears to be a common accompanying condition. What role the diabetes plays is hard to say—it may tend only to lower the patient's resistance and so make him more susceptible to *Klebsiella pneumoniae* infections as well as to other infections. Bachr and his associates¹⁴ point out that stasis in the biliary or urinary tract, either by stone, neoplasm or external pressure definitely plays a role in predisposing to infection in these regions.

PATHOLOGIC AND CLINICAL FEATURES

The pathologic lesions vary with the site of primary infection and the subsequent course of events. In the experimental work reported by Gay and his associates⁹ subcutaneous inoculation in mice produced a spreading lesion containing a viscid exudate consisting of fibrin, bacilli and leukocytes. Intraperitoneal injection into mice resulted in death. Autopsy revealed viscid stringy exudate containing leukocytes in the peritoneal cavity, general septicemia being demonstrated by cultures.

In the human being the pathologic condition produced in the lungs has been well described. The pathologic condition is not as well known in the extrapulmonary lesions. However from the reported cases one can see that *Klebsiella pneumoniae* is a pathogen which may be associated with suppurative processes in any part of the body, more particularly in the gastrointestinal, genitourinary and biliary systems. The suppurative processes tend to be extensive and of a rapidly spreading nature. In many cases complications such as septicemia, liver abscesses, meningitis, pelvic abscesses and subphrenic abscesses make their appearance.

Intra-abdominal infections are usually secondary to a perforative lesion of the colon or appendix. Eighty-seven per cent of the cases reported by Baehr and his associates¹ resulted from appendical abscesses. Other causes may be perforation of a carcinoma, rupture of a diverticulum or traumatic perforation of the bowel. In these cases peritonitis occurs and may be rapidly followed by subphrenic abscess, liver abscesses, empyema, septicemia and pulmonary metastatic abscesses.

Primary liver abscesses fortunately are uncommon. Boettiger and his associates¹³ who reported 2 cases resulting in death say that in their review of the literature less than 25 cases of primary liver abscesses have been reported since 1900. Many of these cases reported as primary liver abscesses are probably in reality secondary to intestinal or biliary disease for like *Escherichia coli* and other intestinal organisms, *Klebsiella pneumoniae* may enter the portal system and be excreted by the liver. Under this circumstance excretory infections are apt to occur if stasis is present.

In the urinary tract *Klebsiella pneumoniae* is often associated with other organisms—*Escherichia coli*, *Proteus vulgaris* and *Bacillus pyocyaneus* most commonly.

Here again when stasis is present, excretion of the organism through the kidney is apt to cause infection. During the past few years in American journals prostatic¹⁴ and perirenal¹⁵ abscesses with complicating pathologic conditions have been reported.

Bachr and his associates¹⁴ in their series found that 38 of the 46 patients with infections of the biliary tract had gallstones in the gallbladder or common bile duct. The pus in the infected gallbladder and common duct tends to be thin and presents no distinctive features, although in some cases it may be foul smelling, thick and mucoid.

In the female genital tract suppuration is present—usually in the adnexa. Pelvic abscesses are apt to develop. A case of uterine gangrene and septicemia following criminal abortion was reported by Hipp in 1936.¹⁶

In the ears a purulent otitis media occurs and is apt to be followed by mastoiditis. Cavernous sinus phlebitis has also been reported.¹⁷

Cases of primary meningitis, osteomyelitis and keratitis have been recorded both in American and in foreign journals.

As a causative agent in septicemia *Klebsiella pneumoniae* is rather uncommon. For Kolmer¹⁸ in his observations on 282 cases of septicemia of all types, remarks that *Klebsiella pneumoniae* septicemia is rarely encountered. However when *Klebsiella pneumoniae* infection does already exist septicemia is not too unusual. Baehr and his associates¹⁴ report that in 16 of their 198 cases (8 per cent) septicemia developed. Meyer and Antman¹⁹ in 1939 brought out the fact that 109 cases of *Klebsiella pneumoniae* septicemia had been reported in the literature. Since 1939 a few more cases have been added to the literature. A feature of interest is that in many of the cases of septicemia the site of origin remained obscure. However with the newer knowledge that in about 75 to 80 per cent of cases the primary site of infection is in the gastrointestinal, genitourinary or biliary tract it is quite probable that the original focus will be discovered more often.

COURSE

The course of *Klebsiella pneumoniae* infections depends on the location of the primary site and the complicating features. In general the disease usually starts rather suddenly with fever and malaise, local pain and tenderness are present. As the infection progresses, the suppurative process soon becomes evident with the cultures showing the organism in large numbers. Until recently a fulminating course with many complicating features has been the usual accepted picture. Of late it has been recognized that *Klebsiella pneumoniae* infections may also run a chronic low grade course in extrapulmonary lesions as well as in pulmonary infections as reported by Solomon.²⁰

TREATMENT AND PROGNOSIS

During the early history of *Klebsiella pneumoniae* infections the only treatment given was supportive and symptomatic. As a result the prognosis was uniformly grave. Although definite mortality figures for extrapulmonary lesions are not available during this early period, in a review of the literature from 1882 to 1938 of pulmonary lesions Hartman²¹ found 232 cases with satisfactory records of *Klebsiella pneumoniae pneumonia* with a mortality of 94 per cent. In the 198 cases reported by Bachr and his associates¹² in 1937 biliary tract infection carried a mortality of 30 per cent as compared with 17 per cent mortality in urinary tract infections. In this report also 16 cases of *Klebsiella pneumoniae* septicemia occurred, of which 4 were not fatal (a mortality rate of 75 per cent).

Another nonspecific form of treatment instituted shortly after the turn of the century was surgical drainage. There is no doubt that this procedure in many cases did save lives.

During the past few years besides the use of several chemical agents, including the iodides, more specific therapy in the form of serum and the sulfonamide compounds has been introduced.

According to Robertson²² type II antipneumococcus serum, which is known to cross agglutinate certain members of the Friedlander group, has been used with some success. Perlman and Bullowa²³ agree that this serum may be of value in *Klebsiella pneumoniae* B infections.

An autovaccine has been used with successful results, as reported in some of the foreign journals.²⁴

Bullowa,²⁵ using specific serum therapy in 8 cases of *Klebsiella pneumoniae pneumonia*, reports a mortality of 50 per cent as compared with a mortality of 89 per cent in the non-serum treated group. The use of serum is still in the experimental stage and, although theoretically it may sound good, it is not very practical, for the serum is not easily available, the cost is high and the cases for treatment are so few that the serum degenerates between infrequent usage.

The sulfonamide compounds, more particularly sulfapyridine, have given some hopeful results. Long and Bliss²⁶ in their book report favorably both from experimental and from clinical studies. Solomon²⁷ was encouraged by the results with sulfapyridine in his series of 17 cases of chronic pulmonary infections. Cures have been reported in various journals since 1939 with sulfonamide therapy in the treatment of *Klebsiella pneumoniae* septicemia,²⁸ meningitis²⁸ and pneumonia.²⁹

REPORT OF CASES

CASE 1—History—W. R., a white man aged 52, a machine operator, admitted to Grace Hospital in 1941, had one week previously suddenly become aware of a sharp aching pain on the inner aspect of his left ankle. The pain was continuous, radiated upward toward the knee and persisted to the time of admission. Swelling and redness appeared about the inner aspect of the ankle after three days and then rapidly increased. He became bedridden at this time because of pain and the increasing swelling and soreness. There was no history of any injury to the ankle or any part of his body. He had had no previous similar episodes. He stated that he had not had a recent cold or sore throat and he had no urinary or gastrointestinal complaints.

He had been known to have diabetes for one year before admission to the hospital, controlled on a diabetic diet and 20 units of insulin daily. A careful review of the systems revealed no abnormalities. There had been no previous operations or accidents. He had been drinking alcoholic beverages in moderation. He had been married for thirty-three years and his wife and six children were alive and well.

Physical Examination—The patient was alert and cooperative and complained of pain in the left ankle. The ears, nose, mouth and throat were normal except for extremely carious teeth. The heart, lungs and abdomen were normal. A rectal examination revealed the prostate to be slightly enlarged but not tender, irregular or boggy. Local examination of the left ankle revealed tenderness, swelling and redness of the ankle and foot. Motion of the ankle was limited almost completely because of pain. No external abrasion or laceration could be seen. There was no evidence of lymphangitis or lymphadenitis. His temperature was 101.4 F, pulse rate 94, respiratory rate 20 and blood pressure 120 systolic and 70 diastolic.

Laboratory Examinations—Examination of the urine at the time of admission revealed 4 plus sugar and 2 plus acetone, blood sugar was 350 and nonprotein nitrogen 40. White blood cells numbered 28,000 with 90 per cent polymorphonuclear leukocytes, of which 12 per cent were nonsegmented. The red blood cell count was 4,800,000 and the hemoglobin content 92 per cent (Dare method). The Wassermann and Kahn reactions of the blood were negative.

Course—The diabetic service was called in to treat the patient's diabetic condition. Treatment in the form of elevation of the extremity, ice bags to the foot and ankle later changed to hot magnesium sulfate soaks, sedation and sulfathiazole 2 Gm immediately and 1 Gm every four hours was instituted.

During the first week in the hospital the patient appeared quite toxic, his temperature ranged between 101 and 104 F. A blood culture yielded no growth. X-ray examinations revealed no evidence of osteomyelitis of the ankle. The sulfathiazole blood level remained between 4 and 5 mg per hundred cubic centimeters. Sedimentation time was fifteen minutes, and the repeated white blood cell count was 22,000 with 78 per cent polymorphonuclear leukocytes. The foot and ankle became more swollen and then localized abscesses appeared over the lateral and medial malleoli and over the dorsum of the ankle. On the eighth hospital day he was taken to the operating room, where the abscesses were incised and drained, with the release of large quantities of chocolate colored viscid pus. Cultures of this pus yielded a pure growth of *Klebsiella pneumoniae* classified as belonging to group A.

Repeated blood cultures were negative. Smears and cultures from the nose and throat were negative for *Klebsiella pneumoniae*. During the next few days there was a rapid progression of the suppurative process up the leg, with many areas of fluctuation appearing in the leg. The patient was given a transfusion of 650 cc of citrated blood and again was taken to the operating room, where multiple incisions were made in the leg. Pus was found extending throughout the entire leg, subcutaneously, in the fascial spaces and in the muscle bellies. Because of this, most of the leg was laid open and rubber catheters were inserted through and through for drainage and irrigation. He was given another transfusion postoperatively and was placed on sulfadiazine therapy with an initial dose of 4 Gm and then 1 Gm every four hours. The pus again yielded *Klebsiella pneumoniae* in pure culture. Repeated

blood cultures again were negative and repeated x-ray examinations of the left ankle were negative for osteomyelitis. Irrigation of the leg with 5 per cent solution of sodium sulfadiazine was carried out through the catheters. During the next week (third week) the patient looked and felt much improved, his temperature returned to between 99 and 100.4 F and the white blood cell count diminished. However on the eighth day following these last incisions it was noticed that the leg was again filling up with purulent material, his temperature rose to 101 F and his white blood cell count rose to 27,500 with 90 per cent polymorphonuclear leukocytes.

A mid thigh amputation was decided on in an attempt to save the patient's life. This was done under spinal anesthesia. During the amputation a pocket of pus was encountered on the lateral aspect of the thigh. This region was gently but carefully debrided, sulfadiazine 5 Gm. was inserted locally and the stump was left open except for one suture to bring the skin over the end of the bone. Cultures of the pus from this region again showed the Friedländer organism. He was again placed on sulfadiazine postoperatively and was given two transfusions of 300 cc each. During the next twelve days he appeared to be making good progress, the stump remained fairly clean, no new progression of the infection was noticed and his temperature remained normal. The sulfadiazine level remained between 5 and 7 mg per hundred cubic centimeters. The stump granulated in well and the remainder of his course was uneventful except for the necessity of having a small abscess opened up at the midportion of the stump which soon healed over. He was discharged on crutches on his forty-eighth hospital day, twenty-eight days after the mid thigh amputation.

Second Admission.—Approximately two months after discharge from the hospital the patient was readmitted with pain, tenderness and swelling of the stump and with a temperature of 103 F. Soon after this admission the stump opened spontaneously and discharged about 200 cc of foul smelling, chocolate colored pus, cultures of this showed *Klebsiella pneumoniae*. After observation for six days during which time the stump did not seem to drain well he was taken to the operating room where the draining abscess of the stump was opened up widely and all the infected granulation tissue was carefully scraped out. Sulfadiazine 10 Gm was inserted locally and he was started on the same drug 1 Gm every four hours by mouth. The blood concentration of the drug was maintained between 6.5 and 9 mg per hundred cubic centimeters for the next two weeks and then gradually decreased. He remained afebrile, the stump healed well and his diabetes was easily controlled. Four weeks after this second admission he was discharged to his family physician. He was seen in the surgical follow-up clinic two weeks, two months and four months after discharge. At each return visit he showed more improvement, he was gaining weight and the stump remained well healed. He was seen again one year after onset of his infection, at which time he was wearing a permanent type of prosthesis and was walking about with the aid of a cane. He had gained 35 pounds (16 Kg.) his general health was excellent and the stump was clean and well healed.

CASE 2³⁰.—M. M., a housewife aged 39, admitted to Grace Hospital in October 1937 had a typical history and physical manifestations of an acute exacerbation of chronic cholecystitis with cholelithiasis. All other systems were normal. A Graham visualization test of the gallbladder revealed a pathologic non-filling gallbladder but no definite evidence of gallstones. On the sixth hospital day she was taken to the operating room, where a gangrenous gallbladder containing stones was removed. The gallbladder was so friable that during its removal it was torn open. A cigaret drain was inserted in the operative region before the abdominal wall was closed. The patient felt well during the first twenty-four hours but then had respiratory distress and cyanosis and a spiking temperature course began 100 to 104 F. Physical examination and x-ray examinations with a portable apparatus were suggestive of either atelectasis or pneumonia in the right lower lobe. During the next three weeks she had a stormy septic course during which time the operative wound stopped draining, repeated white blood cell counts ranged between 18,000 and 35,000 with polymorphonu-

clear leukocytes between 80 and 90 per cent. Two blood cultures were negative. She was given repeated transfusions, parenteral fluids and oxygen intermittently as needed. A subphrenic abscess was suspected during the latter part of this three week period and finally it was deemed advisable to explore the subphrenic region. A thoracotomy was done in the eighth interspace in the posterior axillary line. Considerable sero-sanguineous fluid was found in the pleural cavity, the wound was probed with dry gauze and on aspiration with a needle through the diaphragm dirty yellowish green viscid pus was aspirated. This pus yielded a pure culture of *Klebsiella pneumoniae*. The patient was placed on sulfanilamide therapy, and several days later the subphrenic region was entered from above and a mushroom catheter was inserted through the diaphragm. Drainage was profuse for the first two days, consisting of fibrin leukocytes and red blood cells. Cultures of the drainage were positive for the gram negative Friedländer organism. Later on the amount of drainage decreased and cultures showed *Klebsiella pneumoniae* and *Bacillus proteolyticus*. During the next three weeks the patient was kept on a regimen of sulfanilamide medication and repeated small transfusions. She improved slowly both clinically and by x-ray evidence and was discharged from the hospital eight weeks from the date of admission. At home the thoracotomy wound drained for about five weeks and then closed spontaneously. X-ray films at this time showed decided improvement, the diaphragm was elevated and the pleura was thickened but there was no evidence of fluid levels or any pocketing abscess. She has been followed at intervals during the past five years. After an initial period of two years, during which time she complained of weakness, easy fatigability, an occasional cough and aches and pains in the joints of her shoulders and hands, she has been feeling well, complaining only of mild dyspnea on moderate exertion for the past three years.

COMMENT

Both of the cases herein reported are examples of extrapulmonary *Klebsiella pneumoniae* infections. The first case apparently was one of infection in the soft tissues about the ankle as the primary site of the infection, although there was no local trauma and there were no abrasions or lacerations. Cultures of material from the nose and throat were negative for *Klebsiella pneumoniae*, as were several blood cultures. Stool cultures were not done, but the patient exhibited no symptoms or signs of enteritis or colitis. The organism was definitely established by the various differential tests as *Klebsiella pneumoniae* belonging to group A. The suddenness of onset was typical as were the suppurative process and the septic course. As in many of the latest cases reported, the man had diabetes mellitus as an accompanying condition. When an abscess was encountered during the mid thigh amputation, it was felt that the patient's prognosis was poor for the infection was a severe progressive one with a very virulent strain of *Klebsiella pneumoniae* as evidenced by the previous rapid extension throughout all the tissues of the leg. I have little doubt that adequate surgical drainage and the use of sulfadiazine both locally and generally brought about recovery in this case. Septicemia did not occur or else was so transitory that it was not picked up in the repeated blood cultures.

Case 2 is similar to cases reported by Baehr and his associates in that the primary site of the Friedländer infection was in the biliary tract. As is usual in many of these cases there was a parade of complicating pathologic conditions. In this case a localized peritonitis was followed by a subphrenic abscess and then later by empyema. The predisposing cause here was probably stasis in the biliary tract due to stones. Here again recovery was probably brought about by the combination of adequate surgical drainage and sulfanilamide therapy.

30 Reported through the courtesy of Dr. Anthony J. Mendillo.

SUMMARY AND CONCLUSIONS

1 In 2 unusual cases of extrapulmonary *Klebsiella pneumoniae* infections recovery occurred

2 The use of sulfadiazine in case 1 is, I believe, the first recorded instance of the use of this drug for Friedlander infections in the literature

3 The combination of adequate surgical drainage when possible and sulfonamide therapy at present appears to be the best form of treatment

4 Because of a persistent high mortality rate in *Klebsiella pneumoniae* infections it is felt that further therapeutic trials should be attempted with the newer sulfonamide compounds and also with the newer antibacterial agents such as gramicidin, penicillin and aspergillin

Clinical Notes, Suggestions and New Instruments

THROMBOCYTIC PURPURA DEVELOPING AS A COMPLICATION OF SULFATHIAZOLE AND SULFADIAZINE THERAPY

ROBERT W. HURD, M.D.
ROCHESTER, N. Y.

and

THELMA F. RALPH, I. JACON
MEDICAL CORPS, ARMY OF THE UNITED STATES

Although many types of complications have been described since the sulfonamide compounds were introduced into the treatment of infectious diseases, there are not many instances in which thrombopenia with associated purpura has been reported as a complication of therapy with these drugs. Markel and Rike¹ reported the development of hematuria, melena and oozing of blood from the gums and a wound incision in a case in which sulfanilamide was given postoperatively. The platelet count was 180,000, the bleeding time was prolonged and the clotting time was normal but the clot failed to retract in twelve hours. Necropsy failed to demonstrate any abnormality of the bone marrow. Hoffman² reported hematuria, gingival bleeding, a hemorrhagic macular rash covering the lower extremities and melena in a case in which sulfapyridine was given. No blood studies were reported. Baradulin³ described a generalized purpuric rash with multiple petechiae in the mucous membranes of a patient who received "streptocidin" (a sulfonamide compound). The tourniquet test was positive, but further studies were not reported. Dolgopole and Hobart⁴ reported a diminution of platelets in association with a severe leukopenia in a case in which sulfapyridine was given. Goldbloom and his associates⁵ described a toxic thrombopenia in a woman aged 50 who received 90 grams (6 Gm) of sulfapyridine. The platelet count dropped to 25,000 and the bleeding time was prolonged to twenty-five minutes, with a delayed clot retraction time. Gingival hemorrhages and vaginal bleeding developed. Bone marrow studies were negative. The platelets were suppressed for three days and then returned to normal. Kracke⁶ mentioned a case in which severe throm-

bopenia was presumptively due to the administration of sulfathiazole. Quick and Lord⁷ described the findings in a case of acute hemolytic anemia which developed after the administration of sulfathiazole. The patient had a purpuric rash and a positive reaction to the tourniquet test. Mention was not made of the number of platelets in the blood. Rosenfeld and Feldman⁸ reported the occurrence of a severe thrombopenic hemorrhagic state during the administration of sulfathiazole. During the thrombopenic reaction, the platelet count was 2,000 per cubic millimeter, the bleeding time was six minutes, the coagulation time was four minutes and the tourniquet test was strongly positive. Five days after discontinuance of sulfathiazole, the platelets were again abundant and subsequent doses of sulfathiazole failed to produce the thrombopenic state. Werner⁹ reported a case of thrombopenic purpura which was due to idiosyncrasy to sulfathiazole. The patient was given 139 Gm of sulfathiazole over a period of five days, at which time a slight rash developed. Twenty days later he was given 1 Gm. of the drug and purpuric signs developed within twelve hours. Platelets were not present in the blood smear. Finally, Meyer and Perlmutter¹⁰ reported the findings in a case of aplastic anemia secondary to sulfathiazole. At the height of the reaction, the patient had no platelets in the blood smear, 1,710,000 red blood cells per cubic millimeter, 5 Gm of hemoglobin per hundred cubic centimeters of blood and 1,600 white blood cells per cubic millimeter with only 8 per cent of neutrophils.

We wish to report 2 cases in which thrombopenia developed after the administration of the sulfonamide compounds. In the first case thrombopenia developed after the administration of sulfathiazole and on subsequent testing the same manner of reaction was found to sulfadiazine. In the second case purpura developed during the administration of sulfadiazine, and death occurred.

CASE REPORTS

CASE 1—J. H., a married man aged 61, a clothes cutter was admitted to the Rochester Municipal Hospital Nov. 9, 1941, with a history of sudden onset twenty-four hours previously of shaking chills, weakness, fever and pain in the lower left part of the chest aggravated by breathing and coughing. Twelve hours before admission his cough was productive of bloody sputum. On examination the temperature was 39.5 C (103.1 F) rectally, pulse rate 110, respiratory rate 28 and the blood pressure 100 mm of mercury systolic and 66 mm diastolic. He was dyspneic and acutely ill. He complained bitterly of pain in the left lower part of the chest. The cough was still productive of bloody sputum. Physical signs of consolidation were present in the left lower lobe of the lung. The remainder of the examination was not remarkable. There were no purpuric lesions.

The laboratory data were as follows. The blood Wassermann reaction was negative. The red blood cell count was 5,600,000 per cubic millimeter. The blood hemoglobin was 14.5 Gm per hundred cubic centimeters and the white blood cell count was 19,000 per cubic millimeter. The blood smear showed 94 per cent neutrophils and a normal number of platelets. Urinalysis was negative. A roentgenogram of the chest demonstrated consolidation in the left lower lobe. Blood and sputum cultures were positive for type II pneumococcus.

Sulfathiazole was given by mouth in divided doses. After 12 Gm had been given an oozing epistaxis was noted. At this time the nonprotein nitrogen value of the blood was 50 mg per hundred cubic centimeters and the total protein value of the blood 5.4 Gm, the albumin being 3 Gm and the globulin 2.4 Gm. The blood sulfathiazole level was 4.8 Gm. The mild epistaxis persisted and for the first time a petechial rash appeared over the legs and buttocks and in the oral mucous membranes. Two frankly bloody stools were passed. Administration of sulfathiazole was immediately stopped after

a total of 14 Gm had been given in a period of thirty-six hours. At this time the Francis test was negative, the blood leukocytes numbered 12,700 per cubic millimeter and the hemoglobin was 10.2 Gm per hundred cubic centimeters. The blood smear showed 90 per cent neutrophils and 10 per cent lymphocytes. Only 1 platelet was seen in the entire preparation. Examination of the urine revealed no abnormalities. The blood nonprotein nitrogen value was decreased to 35 mg per hundred cubic centimeters and the sulfathiazole level was 55 mg. Six hundred cc of compatible fresh citrated whole blood and 160,000 units of type-specific antipneumococcus rabbit serum were administered promptly. There was rapid clinical improvement and the platelets reappeared in the blood smear. All purpuric tendencies ceased. Serum sickness developed fourteen days after the administration of rabbit serum.

When the patient had completely recovered from the serum reaction and the pneumonia it was thought advisable to test him for sensitivity to sulfathiazole. The patient showed no

was noted. The patient became more acutely ill and on the day of admission was semistuporous. Of note in the past history was the fact that the patient had had pneumonia in 1939 which had been successfully treated at home with the administration of sulfapyridine. No toxic symptoms were recalled by the patient's family. The general health had been excellent except for some complaints referable to degenerative arthritis. No history of allergy or drug sensitivity was obtained.

On examination, the temperature was 37.1 C (98.8 F), rectally the pulse rate 92, the respiratory rate 42 and the blood pressure 135 mm of mercury systolic and 80 mm diastolic. She appeared acutely ill and semistuporous, with rapid shallow respirations. The pharynx was slightly injected and dry. At the base of the right lung posteriorly there were signs of consolidation—that is, dullness to percussion, increased tactile fremitus and vocal fremitus and bronchial breath sounds.

Laboratory examinations revealed the serologic test for syphilis to be negative. The white blood cell count was 21,000

Clotting time was done by the Lee-White method.

Rumpel-Leede test was done by reading the number of petechiae in 1 square inch area of the skin after a cuff was applied to the arm for 5 minutes with the pressure kept midway between the systolic and diastolic levels.

P refers to neutrophils; L to lymphocytes; M to monocytes; E to eosinophils and B to basophils. The figures indicate the percentage of each of these cells.

On all clotting times reported in this table the clot retraction was good.

reaction to the scratch test, the patch test and the intradermal injection of a 10 per cent saline suspension of the drug. Following this 0.1 Gm and 0.25 Gm were given orally on successive occasions and no fall in the platelet count was observed. At this time three doses of 1.5 Gm of sulfathiazole were administered by mouth at four hour intervals. Eight hours after this test had been started there was a definite diminution of the platelets in the peripheral blood smear. The bleeding time was increased to eight minutes and the Rumpel-Leede test became positive. A tendency to spontaneous bleeding was not noted.

The patient left the hospital and returned two weeks later, Jan 5 1942, for a careful evaluation of his sensitivity to sulfathiazole and sulfadiazine. The observations made at this time appear in table 1.

CASE 2—C B, a widow aged 79, was admitted to the Rochester Municipal Hospital on Feb 26 1942 with a history of onset of chills and fever one week previously. Three days before admission to the hospital a cough productive of blood streaked sputum developed and fever as high as 102 to 103 F

per cubic millimeter and the blood smear showed 86 per cent neutrophils and adequate platelets. The red blood cells were normal. Type VIII pneumococcus was isolated from the sputum. A blood culture was negative. A roentgenogram of the chest showed consolidation in the right upper and right lower lobes.

Shortly after admission 140 cc (approximately 318,000 units) of type VIII antipneumococcus rabbit serum was administered without a reaction. Sulfadiazine was given by mouth in amounts sufficient to maintain a blood level between 9 and 13 mg per hundred cubic centimeters. On February 27 six more vials (approximately 150,000 units) of rabbit serum was given intravenously. The patient continued to appear acutely ill with persistent signs of consolidation and increased respirations. On March 2 it seemed apparent that congestive heart failure was developing and rapid digitalization was undertaken. Throughout this period the white blood cells remained elevated between 13,000 and 19,000 per cubic millimeter and the temperature ranged between 38 and 39.5 C (100.4 and 103.1 F). Repeated blood cultures, examination of the urine and repeated

roentgen examinations of the chest failed to reveal any cause for the unfavorable clinical course. The sputum was retyped and again found to contain type VIII pneumococcus. A thoracentesis was performed on March 6. Twenty cc of blood tinged, sterile fluid was obtained. Throughout this period, the patient received 3 Gm of sulfadiazine each day without manifesting any toxic symptoms. A few crystals were noted in the urine, but the urinary output and sediment and the blood nonprotein nitrogen remained within normal limits.

On March 8, the patient suddenly had a precipitous drop in the white blood cell count from 20,000 to 4,900 per cubic millimeter. The following day a generalized hemorrhagic and petechial rash was noted. This was most prominent over the chest in the axilla over the lower part of the abdomen and over the posterior wall of the chest. Small petechiae were noted in the conjunctivae and mucous membranes of the mouth. There was no icterus or hematuria. The Rumpel-Leede test was strongly positive. The bleeding time was three minutes and the clotting time four minutes. The clot retracted poorly and was friable. The blood smear showed a decided reduction of blood platelets. Blood studies were made daily until the patient died. Table 2 shows the pertinent findings.

Despite multiple transfusions and symptomatic treatment, the patient continued to grow weaker, with increasing manifestation of bleeding into the skin and mucous membranes and died March 13. Permission for autopsy was not granted.

COMMENT

The first patient had a severe thrombopenic hemorrhagic state during the administration of sulfathiazole. He received a total of 14 Gm by mouth during a thirty-six hour period and at the same time had a severe pneumonic infection with a positive blood culture which subsequently became negative. He was also given rabbit serum and had a severe attack of serum sickness. However when all this had cleared he was again shown to be sensitive both to sulfathiazole and to sulfadiazine, thrombopenia developing after the administration of both of these drugs. It is obvious that his sensitivity to sulfathiazole was stronger than to sulfadiazine. We did not continue our experimental dosages to the stage of spontaneous bleeding tendencies.

The second patient experienced a fatal thrombopenic hemorrhagic state during the administration of sulfadiazine. Although she had no bacteremia, it is not feasible to assume that the thrombopenia was due solely to sulfadiazine, as we cannot dismiss her general toxicity as the causative element that played a part in her fatal thrombopenic hemorrhagic state.

SUMMARY

One patient had an unequivocal sensitivity to sulfathiazole and sulfadiazine with resulting thrombopenia and purpura. The other patient experienced thrombopenia and purpura following the administration of sulfadiazine.

In view of the definite demonstration of sensitivity to the drug in case 1 two months after the first reaction to it, we feel that extreme caution should be used with reference to its readministration following the development of thrombopenia, even though Rosenfeld and Feldman⁸ found that this was not true in their experience.

TOXIC REACTIONS OF PAREDRIENE SULFATHIAZOLE SUSPENSION

REPORT OF TWO CASES

MERRILL C. O'DONNELL, M.D., ST. LOUIS

As this new drug has been presented to the medical profession, it is desirable that any untoward reactions from it be brought to the immediate attention of the physician.

Paredrine-sulfathiazole suspension is a preparation introduced by the Smith, Kline and French Pharmaceutical Company. The active components are a suspension of microcrystal sulfathiazole 5 per cent in an isotonic solution of 1 per cent paredrine hydrobromide (p-hydroxy- α -methylphenethylamine). The preservative used is sodium ethyl mercuri thiosalicylate 0.005 per cent, gelatin is present in 0.1 per cent. The product has been recommended by its makers as a vasoconstrictor of the nasal mucosa, with the additional value of the antibacteriostatic action of sulfathiazole. It may be introduced into the nasal cavity and sinuses by drops, atomizer or the displacement method of Proetz. The cases under study have been treated at the Otolaryngological Clinic of the St. Louis University Group of Hospitals.

CASE 1—C. L., a white youth aged 18, had frequently received Proetz displacements with 0.25 per cent ephedrine sulfate in isotonic solution of sodium chloride for a subacute ethmoiditis with no unfavorable reactions. When a paredrine-sulfathiazole suspension was administered in the usual manner, the immediate response of the patient was uneventful. Thirty minutes later, however, he complained of "chilly" sensations over the entire body followed by palpitations and a generalized headache. He was put to bed and given 3 grains (0.2 Gm) of soluble pentobarbital, shortly afterward, 1 grain (0.06 Gm) of codeine sulfate was administered hypodermically. This medication did not modify the symptoms and the headache grew more severe. Nausea, which was present throughout, terminated in severe vomiting. His temperature was subnormal (97 F), the blood count was within normal limits. For twenty-four hours the palpitations and headache persisted to a mild degree. Forty-eight hours later, no symptoms remained and the patient had no apparent ill effects.

CASE 2—L. V., a white married woman aged 54, had been treated for a sphenopalatine neuralgia. She had received displacement treatments three times, twice with a 0.25 per cent solution of ephedrine sulfate in isotonic solution of sodium chloride and once with the aforementioned paredrine sulfathiazole suspension. At no time had she displayed any toxic reactions.

Twenty minutes after receiving the fourth treatment (the second with paredrine-sulfathiazole suspension) she was seized with sudden severe pain generalized over the head. Her hands and legs had sensations of chilliness, while her heart palpitated forcibly. A few minutes later she lay down and was given 10 grains (0.65 Gm) of acetylsalicylic acid as well as cold packs to her head, in a short while she experienced nausea, vomiting and diarrhea. The pain and discomfort increased to such an extent that, four hours after the treatment, the patient was hospitalized. Three grains (0.2 Gm) of sodium amylal and 1 grain (0.06 Gm) of codeine phosphate were given, resulting however in only slight alleviation of the pain. Four hours later and again in four hours, $\frac{1}{2}$ grain (0.03 Gm) of codeine was administered orally.

On admission to the hospital her temperature was 96.6 F, blood pressure 135/84, pulse rate 86 and respiratory rate 20. The blood counts were within normal limits. The headaches continued to a lesser extent into the following day, when she was able to rise from the recumbent position only with moderate to severe pain. Nausea, vomiting and diarrhea did not recur. After approximately six more hours she was completely without headaches and, although still weak, was able to continue her work.

Prior to these episodes I had not observed any reaction other than the usual headaches which occasionally accompany the Proetz displacements. The solution used was obtained from a container which had been opened several days previously but had been tightly stoppered. Other patients had similar treatments from the same solution with no complications.

Special Article

HANDBOOK OF NUTRITION XXV

CONDITIONED MALNUTRITION

NORMAN JOLLIFFE, MD
NEW YORK

These special articles on food and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition—Ed

The terms "malnutrition," "nutritional deficiency disease," "nutritional failure," "beriberi," "pellagra," "scurvy," "riboflavin deficiency" and similar terms signify to many persons disorders arising solely from an inadequate diet. But all these may occur in the presence of dietary adequacy. As pointed out by Kruse,¹ these terms should denote a deficiency in the bodily tissues rather than in the diet. If a tissue deficiency arises from an inadequate diet it is known as a primary deficiency. If the tissue deficiency is caused by factors other than an inadequate diet alone it is known as a conditioned or secondary deficiency. Conditioned deficiencies are caused by factors that interfere with the ingestion, absorption or utilization of essential nutrients, or by factors that increase their requirement, destruction or excretion.²

The importance of these conditioning factors as a cause of deficiency disease has not been generally recognized. In surveys of the nutritional status of population groups there has been a tendency to neglect the causal role of these conditioning factors and attribute all malnutrition to dietary inadequacies alone. On the other hand, in hospital and office practice the finding of clearcut gross manifestations of deficiency disease caused by conditioning factors may lead to one of the following two errors. The first is to consider the lesion a manifestation of the original or conditioning disease unrelated to tissue nutritional deficiency. The second, after recognizing the nutritional basis of the secondary manifestation, is to ascribe the original or conditioning disease to nutritional deficiency. Those making the first error ignore the existence of deficiency disease, while those making the second error attribute most deviations from normal health to malnutrition.

The prevention and treatment of these conditioned deficiency diseases are often the decisive factors in determining recovery after surgery³ and in many severe infections. Likewise their prevention and treatment often decide the success of other therapeutic measures directed toward alleviating the conditioning disease. In addition, the comfort, length of life and economic usefulness of many patients depend on adequate nutrition.⁴

THE POSSIBLE NONSPECIFICITY OF CERTAIN LESIONS OF MALNUTRITION

The gross evidence (table 1) and the better established special examinations (table 2) for the detection of malnutrition as outlined by Jolliffe, McLester and Sherman⁵ are listed in the accompanying tables. Since these manifestations, whether primary or conditioned, are identical, it is not necessary to redescribe them here. It is necessary to point out, however, that with few exceptions the findings characteristic of malnutrition are nonspecific. Some lesions attributable to malnutrition may be produced by local tissue deficiency⁶ as a result of circulatory disturbances, trauma, pressure or infection. These local conditioning factors may produce lesions identical with those of a systemic deficiency. Other lesions may not be related to either systemic or local tissue deficiency but may be due to

TABLE 1—Gross Evidences of Malnutrition

System	Finding	Suggested Deficiency or Syndrome
Eyes	Xerosis conjunctivae and corneae Central opthalmoplegia	Vitamin A Thiamine
Mucous membranes	Scarlet red stomatitis and glossitis with or without secondary Vincent's infection Magenta glossitis Atrophic glossitis	Nicotinic acid Riboflavin Nicotinic acid B complex, Addisonian anemia Pummer-Vincent syndrome Ascorbic acid Riboflavin
	Scorbutic gums Cheliosis Nonspecific urethritis balanitis vaginitis	Nicotinic acid
Skin	Pellagrous dermatitis Seborrheic lesions in nasolabial folds on face behind ears and in skin folds Hyperkeratosis and hyperfolliculosis Hemorrhagic manifestations Fissures in angles of mouth	Nicotinic acid Riboflavin Vitamin A Vitamin K Ascorbic acid Riboflavin
Neurologic	Characteristic bilateral symmetrical polynuropathy Combined system syndromes Wernicke's syndrome Nicotinic acid deficiency encephalopathy Progressive stupor and hebeticude Certain organic reaction psychoses	Thiamine Thiamine B complex, Addisonian anemia Thiamine B complex Nicotinic acid Nicotinic acid Nicotinic acid thiamine and B complex
Skeletal	Rachitic deformities and osteomalacia	Vitamin D calcium phosphorus
General	Underweight pallor underheight edema	Calories proteins iron B complex

some factor other than malnutrition. These facts indicate that all the diagnostic skill and clinical acumen employed by physicians in any other branch of clinical medicine must be employed in the interpretation of lesions usually ascribed to malnutrition. The following observations illustrate this point.

Xerosis conjunctivae is a lesion characteristic of vitamin A deficiency in animals⁷ and one that responds to massive vitamin A therapy in man.⁸ From this it

should not be inferred that all "spots" or elevations that appear on the eyeballs peripheral to the cornea are xerosis conjunctivae. Some are, but others are pterygium and others scleral deposits of varying composition. The contention of Kruse¹ that xerosis conjunctivae is a manifestation of chronic vitamin A deficiency has been criticized by Berliner,⁹ who points out that not all the photographs published by Kruse¹ were characteristic of xerosis conjunctivae, that the vitamin A blood levels are not low and that many of the lesions in question are those usually ascribed to simple senile changes. It should be noted, however, that trained ophthalmologists after gross and slit lamp examinations frequently disagree on the appropriate anatomic labeling in a high proportion of "spot" cases. The blood level of vitamins does not necessarily reflect the state of the tissues and cannot be used as a criterion for the absence of a deficiency disease, particularly a chronic deficiency anatomically manifest.¹⁰ In this type of malnutrition the blood reflects the recent intake of vitamin A. Also to designate lesions of the conjunctiva as senile changes with the implication that senility

10 subjects given 50,000 units of vitamin A twice daily by mouth for ten months, 7 showed definite evidence of responding in the manner described by Kruse. It seems, therefore, that some of these lesions respond to vitamin A therapy. Some may not, but sufficient time has not yet elapsed to decide this point definitely. Complete solution of this problem requires further study, especially the biomicroscopic slit lamp examination of the conjunctivas of experimental subjects maintained with diets deficient in vitamin A.

Corneal vascularity is undoubtedly associated with riboflavin deficiency in many subjects.¹³ In acute cases this condition can be observed by slit lamp biomicroscopy to disappear following riboflavin administration, to return when riboflavin is withheld and to disappear again when treatment is resumed. In this acute type of lesion the ocular symptoms of burning, itching, asthenopia, photophobia and lacrimation are extremely common. Some investigators¹⁴ have used corneal vascularity as an index of riboflavin deficiency in surveys of population groups. Several observers¹⁵ have warned, however, that it is not yet confirmed that all or nearly all of these vascular changes are due only to riboflavin deficiency or that they are a necessary accompaniment of other undoubted signs of riboflavin deficiency. Youmans and Patton¹⁶ have observed a considerable number of subjects with mild but definite corneal vascularization not accompanied by ocular symptoms and in whom there was no correlation with dietary intake of riboflavin, other dietary factors or other evidence of deficiency disease. Reexamination of these subjects showed an improvement or disappearance of the vascularization in the winter or spring season compared with the fall, in spite of a lower intake of riboflavin in the former period. This study suggests that factors other than riboflavin are concerned. Youmans and Patton¹⁶ say "there is some evidence to suggest that such a factor (there may be others) is light,

which may be concerned in the production of a vascularization through the mechanism of a local deficiency without any general deficiency being present. In general, the conclusion which seems indicated is that corneal vascularization, even of the characteristic type and of definite degree, does not always mean a general riboflavin deficiency." Youmans and Patton¹⁶ then point out that under these circumstances the lesion loses some of its value as a diagnostic test of riboflavin deficiency in population groups. For clinical purposes, however, this finding is not only the most helpful and reliable but the simplest and quickest means of detecting mild riboflavin deficiency. To distinguish it from those instances of vascularization which seem to be caused by other agencies, it is as a rule necessary only

TABLE 2—Special Examinations for Detection of Malnutrition

Examination	Condition It May Detect
Röntgenogram of hand and wrist elbow and hip	Rickets and scurvy in children, osteomalacia and scurvy in adults
Röntgenogram of heart	Advanced beriberi
Electrocardiogram	Changes suggestive of thiamine deficiency
Biomicroscopic examination with slit lamp	Capillary invasion of cornea (riboflavin deficiency), changes in conjunctivas (vitamin A deficiency)
Red blood cell count	Iron deficiency anemia, add on in anemia, microcytic anemia
Hemoglobin	
Stained blood smear	
Red blood cell volume	Vitamin C undernutrition
Thiobarbituric acid	
Serum calcium	Vitamin D deficiency
Serum phosphorus	
Blood pyruvic acid	Vitamin B ₁ deficiency
Serum protein or albumin	Protein deficiency
Blood prothrombin	Vitamin K deficiency

per se is responsible for them is unsatisfactory. This merely identifies the condition with a population in which it is frequently found but does not explain its cause. Even in arteriosclerosis, age is not the essential cause. As William Boyd¹¹ has stated, "The advance in years merely permits some slowly acting cause to produce the effects in the vessels. In discussing the lesions of chronic malnutrition, Kruse¹ states that "not all elderly persons show the changes. On the other hand they occur in children. Time, not senility, is the essential point and time does not start the changes, it is simply a dimension over which they progress. They are specific avitaminoses in a state of chronicity, due usually to respective dietary deficiencies running over a period of years. Their prevalence and severity vary with the number and degree of deficient diets. Most important of all, they are

reversible, yielding slowly but completely to appropriate therapy." This latter point has been partially confirmed by Jolliffe and Stern,¹² who observed that of

to consider with it the history the findings of the physical examination and the results of a therapeutic trial.

The central bilateral ophthalmoplegia of Wernicke's syndrome is due to severe acute thiamine deficiency,¹⁷ but ophthalmoplegias occur from many other causes. Central ophthalmoplegias are common in central nervous system syphilis multiple sclerosis, basilar meningitis diphtheritic neuritis and encephalitis.¹⁸ A characteristic bilateral symmetrical polyneuropathy occurs in chronic thiamine deficiency, but a clinically similar polyneuropathy may be due to infectious polyneuritis of the Guillain-Barré type¹⁹ to various intoxicants, to heavy metal poisonings²⁰ or even to deficiencies of vitamins other than thiamine.²¹

The mucous membrane lesions in and about the mouth²² present complex diagnostic problems. Some cases showing a magenta glossitis respond to riboflavin,²³ some to pyridoxine²⁴ and others only to crude liver extract administered parenterally. Cheilosis may appear the same whether due to ariboflavinosis, to edentulous mouth,²⁵ to allergy or to lipstick. Scarlet fungiform papillae at the tip of the tongue are the earliest visible signs of mild acute nicotinic acid deficiency,²⁶ but pipe smoking, particularly in persons unaccustomed to a pipe, may produce a similar picture. Vincent's gingivitis and stomatitis may occur in deficiencies of both ascorbic acid and nicotinic acid.¹² This infection becomes active only in the presence of necrotic tissue. Ascorbic acid and nicotinic acid deficiencies are only two of many causes of tissue necrosis in the mouth.

CONDITIONING FACTORS

Following the definition of a conditioned deficiency disease given at the beginning of this paper, the various illnesses and conditions that may produce such deficiencies are listed in tables 3 to 8. It must be emphasized that these tables are not complete but are intended merely to list the more common illnesses, therapeutic measures and physiologic alterations which condition the production of a deficiency syndrome.

Interference with Ingestion—Strictly speaking, deficiency disease produced by interference with ingestion should not be considered conditioned. Since failure to ingest adequate amounts of food is alone responsible, it would be reasonable to consider these cases as primary deficiencies. Practically, however, in view of the frequency with which disease may interfere with adequate food intake and because of the significance of

this classification for preventive therapy, its inclusion as a conditioning factor is warranted. The more common of these conditions are listed in table 3. Gastrointestinal and neuropsychiatric disorders, food allergy and nausea or pregnancy are noted for their interference with food intake, and the literature is replete with references to deficiency diseases developing under these conditions.

In hospitals a meal placed at the patient's bedside is often considered, on the record at least, as eaten, while actually the patient may have consumed little or none of it. Although this may occur under many conditions, it is particularly likely to occur in elderly patients whose hospitalization is more custodial than therapeutic, who may be confused and whose dentures may be in the property room. Within one week 5 such patients with gross deficiency disease have been admitted to my service from custodial institutions. Jolliffe, Fein and Rosenblum²⁷ have recently reported an illustrative case of classic scurvy pellagra and riboflavin deficiency in a person transferred from a custodial institution where she had been a patient for the previous five years.

Alcohol though it also produces deficiency disease by other means,²⁸ may prevent an adequate food intake.

TABLE 3—Factors Interfering with Ingestion

1	Gastrointestinal disorders
	Acute gastroenteritis gallbladder disease peptic ulcers diarrheal diseases and obstructive lesions of gastrointestinal tract
2	Neuropsychiatric disorders
	Neurasthenia neurosis psychoneurosis psychoses migraine and neurologic disorders interfering with self feeding
3	Anorexia
	Alcohol operations anesthesia infectious diseases congestive heart failure thiamine deficiency visceral pain
4	Food allergy
5	Loss of teeth
6	Pregnancy
7	Therapy
	Diets restricting ingestion of essential foods

It does this by replacing other food and by causing nausea and vomiting through its irritant action on the gastric mucosa. This may result in a thiamine deficiency causing anorexia, which in turn results in deficient intake of other nutrients. In this respect thiamine deficiency is frequently the underlying cause of other deficiencies. In some subjects the anorexia caused by lack of thiamine is a protective mechanism guarding the subject against a high caloric intake. However, civilized man on developing anorexia limits his food intake as a rule not to smaller amounts of a balanced diet but to crackers, toast, tea, coffee sugar and alcohol. With such a diet almost any of the deficiency diseases may develop.

Therapeutic measures often produce deficiency diseases by needlessly restricting the ingestion of certain essential nutritional factors. For example diets prescribed for patients having allergy, peptic ulcers, biliary disease, nephritis hypertension, colitis, diabetes or obesity are often deficient in one or more of the essential nutrients. Such diets may occasionally produce more serious disease than the original condition for which the diet was prescribed. Especially harmful are "slimming" diets published in newspapers. Fortunately their low caloric content gives some measure of pro-

tection for short periods of time, but, if persisted in, serious damage due to malnutrition may occur. The physician should discourage such unbalanced diets, but if despite advice they are persisted in a multivitamin preparation, preferably containing the full daily allowances recommended by the Food and Nutrition Board of the National Research Council,²⁸ should be prescribed. Even well planned reducing diets prescribed by the physician are likely to be short in the B vitamins. For this reason their supplementation with a satisfactory source of these vitamins is desirable. Dried brewers' yeast and extracts of brewers' yeast may be used for this purpose.

Increased Bodily Requirements—Strictly speaking, malnutrition caused by failure to meet increased bodily requirements need not be considered as conditioned, since it is inadequate ingestion of food that is alone responsible. Practically, however, when the metabolic requirement is increased beyond the usual or average range it is warranted to consider this as a conditioning factor. Fever increases the basal metabolism by 7.2 per cent for each degree F.,²⁹ while strenuous physical exertion may increase it as much as fifteen times the basal level.³⁰ The requirement of many nutritive essentials parallels total metabolism whether the change in

TABLE 4—Factors Increasing Nutritive Requirement

- 1 Abnormal activity as associated with prolonged strenuous physical exertion, delirium and certain psychoses
- 2 Abnormal environmental factors
Excessively high temperatures, as in the tropics, in desert and in certain industries
Excessive light glare as from snow or klieg lights
- 3 Fever
- 4 Hyperthyroidism
- 5 Pregnancy and lactation
- 6 Therapy such as thyroid, alpha-dinitrophenol, parenteral dextrose solution, fever therapy, high carbohydrate diets

total metabolism is brought about by physical exertion, disease environment or drugs. These conditions are listed in table 4.

The occurrence of deficiency diseases conditioned by fever, hyperthyroidism, pregnancy and lactation are well known. Less well recognized are the effects of abnormal physical activity and unusual environmental factors. Johnson and his collaborators³⁰ have recently demonstrated an increased requirement of the B vitamins conditioned by moderately strenuous physical activity common to farmers, soldiers and other workers. In a group of men subjected to physical labor equivalent to an output of 4,000 to 5,000 calories, definite deterioration in physical fitness occurred well within one week of starting labor with a diet deficient in the vitamin B complex. Such deterioration could be prevented or cured by the entire B complex containing only 0.6 mg. of thiamine daily but not by 20 mg. of thiamine hydrochloride alone. The applicability of these findings to workers in industry, to men in the armed forces and to patients having delirium or a psychosis with pronounced increase in psychomotor activity is obvious.

Sunlight has been recognized as a precipitating agent in pellagra since Gheradini³¹ in 1792 produced pellagrous skin lesions on various parts of the body by exposure to the sun. In fact this disease is known among the peasants in Italy as *mal del sole*. Since the recognition of pellagra in this country, many clinicians³² have called attention to the possible relationship between exposure to sunlight and the development of the skin lesions. Others³³ have confirmed Gheradini's experiments and in addition have shown that the same exposure in normal subjects leads only to the development of a healthy tan. Furthermore, other trauma, such as radiant energy, dirt, filth and chemical trauma, is believed also to condition nicotinic acid deficient persons to the development of skin lesions.³³ Sunlight not only conditions nicotinic acid deficient persons to skin lesions but is thought by some³⁴ to play a role in conditioning riboflavin deficient persons to corneal vascularization. Johnson and Eckhardt¹³ have demonstrated the effect of sunlight in hastening the onset of corneal vascularization in riboflavin deficient rats, and Sydenstricker, Kelly and Weaver¹³ suggest the possibility that prolonged exposure to bright light may cause destruction of riboflavin in the cornea with the production of ocular signs in the absence of lesions elsewhere. Mechanical irritation has been shown to determine the localization of epithelial metaplasia in vitamin A deficiency,³⁵ while ill fitting dentures and edentulousness which causes caving in of the angles of the mouth may condition the lips to cheilosis.³⁶

By increasing total metabolism, various therapies may produce a conditioned deficiency disease. Drugs such as dinitrophenol, thyroxine and thyroid³⁰ and fever therapy³⁰ act by increasing metabolism, while parenteral administration of dextrose, insulin shock therapy and high carbohydrate diets act by increasing the requirement for coenzymes without an increase in total metabolism.³⁰ Many investigators believe that long continued parenteral administration of dextrose is dangerous to patients, particularly those in a borderline state of nutrition. The oxidation and decarboxylation of pyruvic acid, one of the intermediate products of carbohydrate metabolism, requires an enzyme-coenzyme system consisting of a specific protein enzyme (carboxylase), a cocarboxylase (thiamine-pyrophosphate) and magnesium. Other essential components in the mechanism of carbohydrate oxidation include flavo protein, the dietary precursor of which is riboflavin, coenzymes I and II, the dietary precursor of which is niacin amide, adenosine triphosphate and the iron containing cytochrome system.³⁸ Bollman³⁷ has demonstrated that rats partially depleted of their stores of B vitamins and subsequently maintained with dextrose have a longer survival time if thiamine also is administered. No appreciable further effect was noted when the other B vitamins were supplied. Apparently the period of depletion had affected the body stores of thiamine more than it had the other factors of the B complex. Sydenstricker,²² Jolliffe and Goodhart,³⁸ and

Spies³⁹ have reported the precipitation of deficiency diseases in man by dextrose infusions. Sydenstricker²² believes that "waterlogging" after the parenteral administration of dextrose and saline solution is more often a manifestation of deficiency than otherwise. The preventive practice of simultaneously administering thiamine, riboflavin and niacin amide along with each dextrose infusion is based on sound theoretical and practical considerations.

Excessive consumption of carbohydrate acts in the same way as parenteral administration of dextrose and there is much evidence in the literature that this is a common method of inducing deficiency diseases.⁴⁰ Stepp and Schroeder⁴¹ and German, Morvan and Babin⁴² have reported instances of beriberi occurring in persons who would have had an adequate thiamine intake except for their unusually high carbohydrate diet. Jolliffe and his co-workers⁴³ have demonstrated the same phenomenon in alcoholic patients.

Interference with Absorption—As our knowledge of deficiency diseases increases it becomes more and more evident that disturbances of absorption from the intestinal tract play an important role in the production of deficiency disease. As pointed out by Beams, Free and Glenn,⁴⁴ absorption may be impaired because of anatomic, chemical or physiologic changes. These changes are mediated by reduced absorbing surfaces, altered secretions and hypermotility and further modified by various alkalis, adsorbents and lubricants introduced by the mouth. The more common of these conditioning factors are listed in table 5.

In the diarrheal diseases hypermotility plays the most important role, since the rapid passage of food through the intestinal tract leaves little time for digestion, solution and absorption of the essential factors. In the more chronic diarrheal states, as in sprue or chronic ulcerative colitis, reduction of absorbing surfaces may be equally important. The clinical importance of diarrhea in producing deficiency disease is evidenced by the many recent reports of pellagra, beriberi, scurvy, riboflavin deficiency, vitamin A deficiency, protein deficiency edema and hypocalcemia induced by this conditioning factor.⁴⁵

Achlorhydria may impair the absorption of ascorbic acid⁴⁶ and of thiamine.⁴⁷ Because of its prevalence particularly in elderly people, achlorhydria always should be suspected in unexplained malnutrition, and malnutrition should be looked for in every subject having achlorhydria.

The role of bile salts in the absorption of the fat soluble vitamins, particularly K, is so well known⁴⁸ that it needs only to be mentioned.

The role of vitamin deficiencies themselves in acting as a conditioning factor by impairing absorption is just beginning to be recognized. The intestinal absorption of galactose and probably other sugars is impaired in experimental B complex deficiencies in the rat⁴⁹ and in the dog.⁵⁰ Groen⁵¹ has shown reduced absorption of dextrose in deficiency states, and Beams, Free and Glenn⁴⁴ have also shown impaired absorption of galactose from the intestinal tract in patients suffering from pellagra, sprue and rosacea keratitis. After therapy, absorption returned to normal in the pellagrins and in some of the patients with rosacea keratitis but in none of the patients with sprue. Lepore and Golden⁵² have reported x-ray evidence of a characteristic small intestine lesion in some cases of deficiency diseases which could be cured by B complex therapy. They believe

TABLE 5—Factors Interfering with Absorption

Liquified petrolatum colloidal adsorbents severe catharsis gastric or intestinal resections and short circuiting operations

that the impaired absorption was caused by disturbances in motility. Recent reports⁵³ indicate that carcinoma of the intestinal tract causes defective absorption of vitamin A which can be corrected by B complex therapy.

Therapy may play an important role in interfering with absorption. Gastrointestinal surgery, particularly resection and short circuiting operations⁵⁴ has long been known to produce macrocytic anemia similar to Addisonian pernicious anemia, and there are many case reports to indict it as a factor in the production of

other deficiency syndromes." Ingestion of liquid petrolatum daily or almost daily is a common practice among many people who are well except for constipation of varying degrees. That such an agent interferes with the absorption of fat soluble vitamins has been indicated by a number of observers.⁵⁵

Interference with Utilization—This factor is extremely complex and difficult for direct experimental verification. Evidence for interference with utilization is largely circumstantial. In the presence of an adequate intake it is necessary to rule out malabsorption, increased destruction in the bowel, excessive excretion and abnormal requirement before concluding that utilization is defective. It is known for instance that the body must convert carotene to vitamin A, phosphorylate thiamine to coenzyme I and II, and that riboflavin is essential to more enzyme systems than any other of the known vitamins. Some of these changes may occur in tissue cells in general, but the evidence at this time indicates that the liver is the main organ in which these processes take place. Be that as it may, it is in hepatic disturbances that malutilization is most frequently encountered. In the presence of liver dysfunction these disturbances may be due not only to

TABLE 6—Factors Interfering with Utilization

failure of conversion but to inability of the liver to store a nutrient. The body is then dependent on the day to day intake. This intake naturally varies, with the result that an excess today cannot be stored for a deficit almost certain to occur on some future day.

The more common illnesses associated with impaired utilization are listed in table 6. A tissue deficiency in vitamin A attributable to impaired conversion of carotene to vitamin A has been reported in liver cirrhosis,⁵⁷ diabetes mellitus,⁵⁸ obstructive jaundice⁵⁹ and hypo-

thyroidism.⁶⁰ The low plasma levels of vitamin A observed at times in patients having gastrointestinal cancer have been explained as a failure to utilize due to hepatic dysfunction. The high frequency of nutritional diseases in chronic alcohol addicts⁶¹ is well known. Hepatic dysfunction undoubtedly plays a role in these cases. The prevalence of abnormal dark adaptation in hypothyroidism has been thought to imply that the thyroid hormone plays a part in the conversion of the carotene to vitamin A.⁶⁰

Therapy also may interfere with the utilization of vitamins. Although deficiency disease produced by sulfonamide compounds has been attributed mainly to sterilization of the intestinal tract and inhibition of intestinal synthesis of certain factors,⁶² West⁶³ has shown that diarrhea and weight loss in dogs induced by nicotinic acid deficiency and correctable by giving nicotinic acid was not corrected if sulfapyridine was given with the nicotinic acid. On the other hand, raw liver would cure these dogs even in the presence of sulfapyridine, suggesting that sulfapyridine inhibits the action of nicotinic acid but not of the preformed coenzymes present in raw liver. To test out the clinical importance of this finding I have maintained 5 pellagrins in relapse with a basal diet poor in nicotinic acid and administered sulfapyridine in sufficient quantities to obtain a blood level of 8 to 12 mg. One Gm. of sulfapyridine was thereafter administered every four hours, and 400 to 1,000 mg. of nicotinic acid was administered by mouth daily. All the signs and symptoms of pellagra responded as promptly as could be expected if sulfapyridine had not been administered. With the doses of nicotinic acid given (probably excessive) I failed in these few cases to observe any inhibiting effect of sulfapyridine.

Rhoads⁶⁴ has produced cancer in susceptible rats by administering a carcinogen. This action was completely prevented by feeding yeast and partially prevented by riboflavin and casein. With in vitro experiments it then was shown that butter yellow blocked the function of coenzyme I. A constituent of this enzyme is nicotinic acid amide. Rhoads concluded "that the administration of at least one carcinogenic chemical injured normal cells by interfering in some way with an enzyme system which is essential for their normal chemical and so their normal life. The results suggested, furthermore, that this principle of the poisoning by a specific chemical of at least one, and possibly more than one, normal enzyme system caused the normal cell to become a cancer cell." Furthermore, these studies "suggest the necessity of a complete and precise examination of a large number of patients having malignant neoplasms in order to ascertain whether or not they show any evidence of an interference with chemical

systems of which vitamins form essential compounds" Drake and his co-workers⁶⁰ have shown in guinea pigs that phenytoin produces a rapid and progressive fall in the blood ascorbic acid level and recently he⁶⁰ has shown that phenytoin lowers the blood ascorbic acid level in human beings. Similarly radiation sickness has been attributed to failure of coenzyme formation from thiamine or nicotinic acid or both⁶¹.

Increased Excretion—The role of increased excretion of vitamins in the production of malnutrition has received little attention, although the production of hypoproteinemia by albuminuria and salt depletion either by excessive sweating or by polyuria, are well known phenomena. The possible factors causing increased excretion are listed in table 7. I know of no case report in the literature in which a vitamin deficiency was thought to be produced solely by this conditioning factor. Cowgill⁶² has shown, however, that vitamin B₁ deficiency symptoms appear earlier in dogs maintained with a forced water intake than in dogs that were permitted to drink water ad libitum. He attributed this to increased excretion of vitamin B₁. The possibility of "washing out" the water soluble vitamins must therefore be considered in uncontrolled diabetes mellitus and diabetes insipidus. The loss of vitamins by lactation may be a precipitating factor for deficiency diseases. I have seen 3 patients with severe gestational polyneuropathy who had had only minor symptoms during pregnancy but who rapidly developed severe polyneuropathy during the second week post partum. It was felt that the drain of lactation was the final straw in the pathogenesis of this severe thiamine deficiency.

Methods for determining vitamins in the sweat are technically difficult and not yet satisfactory, so that the practical significance of vitamin depletion by excessive perspiration has yet to be shown convincingly.

By increasing excretion, therapy may contribute to the production of deficiency disease. The forcing of fluids, especially over long periods of time as in certain urinary tract infections, and the loss of fluids by diuresis as in anasarca may be the last straw required to produce a deficiency. Salicylates have been reported⁶³ to increase urinary excretion of ascorbic acid, but Youmans and his co-workers⁶⁴ could not confirm this observation.

Increased Destruction—Increased destruction of vitamins may occur in the gastrointestinal tract prior to absorption or in the tissues following absorption. The conditioning factors thought to cause increased destruction of vitamins in human beings are listed in table 8. This list does not include either induced thiamine deficiency in animals caused by enzymatic destruction of thiamine by raw carp or of biotin deficiency in man

induced by egg white injury, as neither has been shown to occur spontaneously in man, although neither is beyond possibility.

Green⁷¹ and Coombes⁷² and their associates have shown thiamine deficiency to be the cause of Chastek paralysis in silver foxes. This deficiency was caused by raw carp, which, when mixed with the food, causes rapid destruction of thiamine. Cooking the carp effectively destroys its ability to inactivate thiamine. It is not known whether any other variety of fish has this ability. I have recently examined four ship-wrecked sailors whose diet for forty-eight days consisted chiefly of raw fish and raw turtle. None of these men showed clinical evidence of thiamine deficiency, and their blood thiamine levels were within normal range.

Induced biotin deficiency in man has been produced experimentally by Sydenstricker and others⁷³. He accomplished it by severe dietary restriction plus the feeding of large amounts of raw egg white. The avid-albumin in egg white presumably "fixes" the biotin in the intestinal tract.

The susceptibility of ascorbic acid and thiamine to destruction in alkaline environment has led to some

investigation of the role played by achlorhydria and alkaline therapy. Alt, Chinn and Farmer⁷⁰ have shown a 65 per cent destruction of ascorbic acid in three hours at a pH of 7.95, representing achlorhydric gastric juice, and obtained results on patients with achlorhydria suggesting decreased assimilation of ascorbic acid. Kendall and Chinn⁷⁴ have obtained from the gastric contents and feces of achlorhydric patients bacteria which destroy ascorbic acid and suggest "that the ascorbic acid fermenting strains may gain the ascendancy in the alimentary canal of certain persons, leading in them to a detectable ascorbic acid deficit." Wright and Ludden⁷⁵ have also observed signs of vitamin C deficiency in persons with achlorhydria in spite of a

liberal ascorbic acid intake. They were also able to demonstrate lack of absorption in these subjects after an oral test dose.

McNuck, Robinson and Field⁷⁵ have shown that thiamine is stable in gastric juice over a pH range of 1.5 to 8.0 during sixteen hours of incubation. In the presence of added antacids the thiamine is completely destroyed and in the presence of bile or pancreatic juices 50 to 90 per cent was destroyed. The same investigators noted subnormal urinary excretion of a test dose of thiamine in subjects who were given alkalis. Tests in this laboratory by Goodhart⁷⁶ also indicate that achlorhydria may interfere with the absorption of thiamine.

Recent investigations indicate that some of the vitamins, particularly ascorbic acid, may play a prominent role in the detoxications. Martin, Fisher and Thompson⁷⁷ have reported that ascorbic acid, cystine, ammoniacetic acid and calcium gluconate definitely reduced the acute toxic manifestations of sulfanilamide, sulfathiazole and sulfapyridine in rats, while thiamine and nicotinic acid were ineffective. Holmes and his associates⁷⁸ have included that toxic lead compounds react with ascorbic acid to form a poorly ionized nontoxic salt of lead. The data of Farmer, Abt and Aron⁷⁹ indicate that the lowering of plasma ascorbic acid in neoparsphenamine therapy may be the consequence of an attempt on the part of the body to detoxify the drug. The recent findings of Drake⁸⁰ on phenytoin, previously discussed in the section on malnutrition, also may be explained as a diversion of ascorbic acid to detoxify this drug.

CONCLUDING COMMENT

The term malnutrition signifies not a dietary inadequacy but a tissue deficiency of an essential nutrient. This tissue deficiency may be caused by the failure to ingest an adequate diet. This tissue deficiency may also be caused by factors which interfere with ingestion, absorption or utilization of essential nutrients or by factors that increase the requirement for vitamins, their destruction or excretion. These are known as conditioning factors and when a deficiency disease is produced through their mediation it is known as a conditioned deficiency disease or conditioned malnutrition. The more common illnesses, physiologic factors and therapeutic measures that may produce a conditioned deficiency disease have been listed and briefly discussed. These findings warrant the conclusion that many diseases and some of the therapeutic measures used to combat them interfere with nutrition and are potent factors in the production of deficiency diseases. It is also an inescapable conclusion that the treatment of malnutrition is in each person an individual medical problem requiring exact diagnosis and therapeutic measures which cannot with safety be left in the hands of nonmedical persons. The physician who does so is derelict in his duty to his patient.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

THE VALUE OF THE XANTHINE COMPOUNDS HAS BEEN DISPUTED ON MANY OCCASIONS. IN 1930 AND IN 1937 (J. A. M. A. 91:1306 [APRIL 26] 1930 AND 108:2203 [JULY 26] 1937) THE COUNCIL REVIEWED THE CLAIMS FOR XANTHINE COMPOUNDS IN ORDER TO AID THE MEDICAL PROFESSION IN EVALUATING THE CLINICAL POSSIBILITIES OF THESE AGENTS. TO BRING THIS INFORMATION, UP TO DATE, THE COUNCIL HAS AGAIN INITIATED A STUDY OF THE THERAPEUTIC CLAIMS BY ASKING DR. NORMAN H. BOYER TO PREPARE THE FOLLOWING REVIEW OF RECENT WORK ON THIS SUBJECT.

IT AUTHORIZES PUBLICATION OF THIS REPORT. THE COUNCIL WISHES TO EXPRESS ITS APPRECIATION TO DR. BOYER FOR HIS REVIEW.

ALBERT E. SMITH, M.D., Secretary

AMINOPHYLLINE AND RELATED XANTHINE DERIVATIVES

PRESENT STATUS OF THERAPEUTIC CLAIMS

NORMAN H. BOYER, M.D.

BOSTON

The methyl derivatives of xanthine for which therapeutic claims have been made include caffeine, theobromine and theophylline. The slight solubility of the latter two limits their usefulness, but soluble double salts of either theobromine or theophylline can be formed with a number of compounds. The most widely used combinations are theobromine calcium salicylate or sodium acetate and theophylline ethylenediamine (aminophylline). Caffeine, although the first of the xanthines to be studied and used, has in recent years succumbed to the greater interest shown in theobromine and theophylline. The stimulating effects of caffeine on the central nervous system are somewhat greater than shown by theobromine and theophylline, and its effects on the circulation are definitely less. Theophylline may also produce stimulation of the central nervous system. In addition, the latter drug has the disadvantage of causing gastric and occasionally renal irritation.

DIURETIC ACTION

The value of the xanthines as diuretics dates back to the observations of Babcock,¹ Askanazy,² Breuer³ and Dessauer.⁴ These observations have now been amply confirmed, the efficacy of the xanthines as diuretic in congestive heart failure is established. They are usually ineffective when edema is due to extracardiac causes and are inferior in diuretic activity to the mercurial compounds. The convenience of oral therapy often is a distinct advantage of the xanthines.

Diminished dyspnea following the use of xanthines, especially in arteriosclerotic subjects, has been attributed to improvement in collateral coronary circulation,⁵ but this is only speculation and in view of the established diuretic property of these drugs it seems likely that the latter mechanism is the more important one.

Although commonly used as an emergency measure during an attack of paroxysmal dyspnea or acute pulmonary edema due to heart failure, there is no crucial evidence indicating that the xanthines exert any immediate beneficial action under such circumstances. They may, however, be useful in preventing future attacks.

⁷⁹ Drake, Gruber, Hauray and Hart.⁸⁰ Drake.⁸⁰

MYOCARDIAL STIMULATION

Starr and his collaborators⁶ found that theophylline when given to patients intravenously increased the cardiac output and left ventricular work without increasing the size of the heart. This was interpreted to indicate myocardial stimulation. The effect of caffeine was in the same direction but of less magnitude and, in the statistical sense, was considered to be insignificant. Boyer and Green⁷ found by a totally different method that the xanthines often produced stimulation of the heart and that in this respect the action was similar to epinephrine though less pronounced.

DISEASE OF THE CORONARY ARTERIES

The place of the xanthines in the therapeutics of coronary occlusion and angina pectoris is a subject about which a great deal of controversy and confusion exists. The effects of the xanthines on the coronary arteries, on coronary blood flow and on myocardial infarction has been extensively studied in the experimental animal. In early studies these drugs were observed to produce dilatation of excised coronary arteries. This is obviously a crude, unphysiologic method and does not permit interpretation in terms of clinical medicine or response of the intact animal. Furthermore, the demonstration of dilatation of the large arteries, which lend themselves to such studies, is no criterion of increased flow through smaller arterioles and capillaries. Later methods involving the measurement of outflow from the coronary sinus or coronary inflow by means of the thermostromuhr indicated an increase in coronary flow but have the disadvantage of measuring mean flow only and furthermore, both methods have been shown to be subject to serious error⁸. Boyer and Green,⁷ using a method which allows determination of the flow existing at any moment of the heart cycle, found that the xanthines decreased flow during systole, indicating that the compression of the coronary bed during contraction of the heart was increased. This myocardial stimulation could be shown to precede the increase in total coronary flow, and the suggestion was made that the increase in metabolites liberated in the heart may have produced some or all of the coronary dilatation. Unless it can be shown that the increase in coronary flow is greater than the increase in cardiac metabolism, these drugs cannot be considered effective in increasing the relative blood supply to the heart. The nature of the experiments did not allow the authors to arrive at conclusions on this point. It should be noted that in all reported experimental studies the increase in coronary flow produced by the xanthines has been very transient.

An attempt has been made to discover the effect of the xanthines on myocardial infarction resulting from ligation of a coronary artery in the experimental animal.

Fowler, Hurvitz and Smith⁹ reported that the extent of cyanosis appearing in an area of the heart acutely deprived of its blood supply was lessened by the administration of aminophylline. Personal experience indicates that such an estimation is extremely difficult. Furthermore, if it does occur it can be attributed to the emptying of venous channels by the increased vigor of myocardial contraction previously referred to, as well as, or better than, to opening of collateral vessels. These authors also estimated that the size of the infarction in dogs killed at intervals of days or weeks following coronary artery ligation and given theophylline with ethylenediamine was smaller than in untreated dogs. Gold, Travell and Modell¹⁰ came to exactly the opposite conclusions by carefully measuring the size of the infarct. Actually the infarcted area in the treated animals averaged 18.3 per cent larger than in similar animals untreated with aminophylline. The authors found it difficult to understand how aminophylline could make matters worse and thought that the difference may have been accidental. There is no denying the possibility of an accidental difference of this magnitude, but it is also possible that the increase in metabolic demands induced by the drug may have had a hand in increasing the size of the infarct. Furthermore, Gold, Travell and Modell found that ventricular tachycardia appeared in 87 per cent of the animals untreated with aminophylline, whereas it occurred in 47.4 per cent of the animals receiving the drug. Unfortunately these investigators used cats, while Fowler, Hurvitz and Smith used dogs as the experimental animal. It is, however, extremely unlikely that the divergent results can be accounted for entirely on the basis of species difference. LeRoy, Fenn and Gilbert¹¹ concerned themselves with the immediate mortality (twenty-four hours) of dogs subjected to ligation of a coronary artery and the effect of drugs on the mortality rate. Under the conditions of their experiments they found an immediate mortality of 70 per cent in untreated dogs. The rate for dogs receiving theobromine with sodium acetate was reduced to 23 per cent and for dogs receiving theophylline was 56 per cent. Considerable doubt may be justifiably raised as to the significance of the reduction (14 per cent) produced by theophylline. The beneficial effects of theobromine sodium acetate, however appear to be much more definite. Since the immediate mortality is mainly concerned with the onset of cardiac arrhythmias (i.e. ventricular fibrillation) these results are somewhat at variance with those reported by Gold, Travell and Modell. Wiggers and Green¹² were unable to show any immediate favorable effect of the xanthines on blood flow or muscular contraction in an area deprived of its blood supply by coronary artery ligation.

Clinical evaluation of the xanthine drugs in the treatment of coronary artery disease is more important and at the same time much more difficult than determining their effect on experimental animals. The majority of reports in the literature indicate that these drugs are valuable in the treatment of angina pectoris or acute

coronary thrombosis¹³. However, there is no lack of adverse reports. Gold, Kwit and Otto¹⁴ and Evans and Hoyle¹⁵ concluded that the xanthines exert no specific beneficial action which would justify their use in the treatment of angina pectoris. Those who favor the use of the xanthines have attributed failures to advanced disease of the coronary arteries which is beyond help of any kind while those who do not believe in the efficacy of the drugs have attributed success in individual cases to placebo-like action. The mere existence of honest differences in opinion suggests that these drugs may be without specific action in the treatment of cardiac pain. Clinical evaluation of the use of any procedure in the treatment of angina pectoris is rendered difficult by the natural course of the disease, with spontaneous remissions and exacerbations, by the subjective nature of the disease and by the many factors which may influence the occurrence of pain. In order to obviate or control some of these factors, objective measurement of the effect of the xanthines has been attempted. Brown and Riscman¹⁶ used the response to a standard exercise test as a criterion for the effect of the xanthines on the amount of work which could be accomplished before pain was induced. Untortu-

aminophylline than before. In evaluation of the treatment of a disease as variable as is angina pectoris much more striking results should be demanded before therapeutic claims are made. Levy, Bruenn and Williams¹⁸ tested the effect of aminophylline on the occurrence of pain and on electrocardiographic changes induced by breathing a low oxygen mixture in patients with coronary artery disease. They found that aminophylline intravenously increased the duration of anoxemia tolerated before pain appeared by an average of approximately four and one-half minutes (63 per cent) and decreased the average arithmetical ST segment deviation by approximately 2.2 mm (50 per cent). Aminophylline by mouth was less effective and, on the average, increased the duration of tolerated anoxemia by a little over two minutes (26 per cent) and decreased the average ST segment changes by 1.4 mm. The evidence presented by these figures is suggestive but certainly not conclusive. The number of patients tested was small (10) and the average differences produced by aminophylline administered orally is not so great as to preclude some doubt as to their significance. It should also be noted that of ten tests with intravenous aminophylline 1 patient experienced pain after a shorter period of breathing the low oxygen mixture than when in the untreated state.

Number of Trips Without Medication and After Aminophylline

No. Treatment	Aminophylline 3 Grams (0.2 Gm.) Four Times a Day
20-32	29
26-40	23
16-23	16
26-31	22
30-44	54
35-44	57
31-42	35
8-11	10
31-60	41

nately this report gives no actual figures for the amount of work performed before and after the administration of the drugs but simply the percentage of patients "improved." They reported improved exercise tolerance in 31 per cent of patients treated with theobromine and 54 per cent treated with theophylline. When these xanthines were combined with sodium acetate the number of patients showing improvement increased to about 80 per cent.

In another report Riscman and Brown¹⁷ claimed that aminophylline improved the exercise tolerance by as much as 100 per cent. Such improvement must have been exceptional, for a table giving the actual number of trips over a two step platform gave the figures reproduced herewith.

This is certainly not impressive evidence for improvement. Only 2 of the 9 patients according to the suggestive evidence presented in their table were able to tolerate more exercise after the administration of

CHEYNE-STOKES RESPIRATION

Hot black coffee is a time honored respiratory stimulant, and caffeine has long enjoyed a reputation of effectiveness in the treatment of periodic breathing. Recently the other xanthine compounds have been utilized and studied with regard to their effectiveness. Marias and McMichael¹⁹ reported that intravenous aminophylline was almost always effective in restoring rhythmic breathing but that frequently the effect was transient, especially when the irregular respiration was associated with severe heart failure or with head injuries or intracranial hemorrhage. In other cases the effect of a single injection lasted hours or even permanently abolished the respiratory arrhythmia. The authors attributed the favorable action of aminophylline to direct stimulation of the respiratory center, since they found no change in pulse rate, blood pressure or cardiac output to indicate central circulatory stimulation. As was previously indicated, the experience of other investigators is not in accord with the latter findings. Marias and McMichael inferred that the action of the drug did not depend on dilatation of the cerebral blood vessels with consequent improvement in blood supply to the respiratory center because of the observation that aminophylline increases pulmonary ventilation in normal subjects. It was assumed by the authors that a drug which enhanced the removal of metabolic products from the respiratory center would tend to depress respiration in normal persons. An increase in both rate and depth of respiration in normal subjects by aminophylline has been confirmed and the suggestion made that the drug be routinely used to prevent post operative atelectasis.²⁰

Nathanson and Fitzgibbon²¹ also found aminophylline to be effective in the treatment of Cheyne-Stokes

respiration. When given intravenously its action was immediate and the effect often lasted for hours. In some instances oral medication with aminophylline was also thought to be helpful.

BRONCHIAL ASTHMA

In 1921 theobromine and theophylline were shown to have a bronchodilator action on excised pig bronchi.²² This observation has recently been confirmed by Young and Gilbert,²³ who also used isolated bronchi. The latter authors found that aminophylline exerted a protective action against bronchial constriction produced by histamine, that ethylenediamine alone is ineffective, and that the action of aminophylline was a direct one on the bronchial muscle. More recently Luduena,²⁴ using the whole animal also confirmed the bronchodilator effect of theophylline derivatives. Not only did the xanthines produce dilatation of "normal" bronchi but they overcame in variable degree, bronchoconstriction produced by histamine, bismuth pilocarpine and anaphylaxis. The xanthines were inferior to epinephrine by a very large margin (1,000 to 2,000 times). In pithed dogs a similar though less pronounced effect of the xanthines was observed, indicating that action on the central nervous system is not an essential factor in its efficacy. The author attributed the decreased effectiveness in the pithed animal to poorer general condition of animals so treated. When animals were given moderate doses of the xanthines over a period of weeks no microscopic changes could be demonstrated in the tissues. However, when larger doses were administered over a period of weeks slight microscopic changes were observed in the meninges and kidneys.

Meanwhile these drugs had been found useful in the clinical treatment of bronchial asthma,²⁵ finding their greatest field of usefulness for patients who had become unresponsive to epinephrine. The clinical usefulness of aminophylline in the treatment of bronchial asthma has been confirmed by a large number of clinicians whose opinions have not found their way into the literature.

HYPERTENSION AND PERIPHERAL VASCULAR DISEASE

No careful clinical study of the effects of xanthines on hypertension has appeared, but it is the general consensus that these drugs are without value in reducing high blood pressure.

In 1934 Scupham²⁶ reported that clinically the xanthines appeared to do good in some cases of some kinds of peripheral vascular diseases. It was absolutely ineffective in Raynaud's disease and in acrocyanosis. It seemed to help some cases of thromboangitis obliterans or arteriosclerotic vascular disease. Unfortunately most of the cases reported by this author were hospitalized and other forms of recognized treatment for vascular disease were administered.

McGovern, McDevitt and Wright²⁷ using skin temperature changes as a criterion and administering large

doses of theobromine with sodium salicylate (26 Gm.) by mouth, concluded that this drug was too feeble and unreliable a vasodilator to be of value in the treatment of peripheral vascular disease. Stewart and Jack²⁸ measured peripheral blood flow by changes in the thermal conductance of the skin. By this method aminophylline produced an increase in peripheral blood flow of 40 to 195 cc per square meter of body surface per minute in eighteen to twenty-five tests. The effect was always transient and this fact, together with doubts related to the method used, renders the report of questionable value in demonstrating that aminophylline is a valuable therapeutic agent in the treatment of peripheral vascular disease.

SUMMARY

1 The xanthine derivatives are useful diuretics in congestive heart failure. The diuretic action of theophylline is somewhat more intense but less lasting than theobromine compounds. The latter give rise to less gastric irritation than do theophylline compounds, although enteric coating minimizes this difference. There is no satisfactory evidence to show that these drugs exert an immediate action which justifies their use in acute pulmonary congestion or edema.

2 The xanthines stimulate the myocardium to increased vigor of contraction. This is accompanied by increased cardiac output and increased work of the heart.

3 Increased coronary blood flow produced by theophylline in the experimental animal follows rather than precedes the myocardial stimulation. Until it can be shown that the increase in coronary flow is disproportionately large in comparison to the increase in cardiac metabolism the experimental basis for the clinical use of theophylline in increasing the blood supply to the heart must rest on insecure ground. Evidence that the xanthines exert a favorable influence on experimental myocardial infarction is inconclusive but seems slightly in favor of the absence of any such favorable action.

4 Clinical evaluation of the usefulness of the xanthines in the treatment of coronary artery disease is far from satisfactory. It seems wise to place the burden of proof on those who claim therapeutic efficacy, and the evidence presented so far does not seem altogether unequivocal. Reports based on the evaluation of the subjective accounts of patients is open to serious errors and attempts to determine the objective effect of these drugs, while commendable, are not beyond criticism. The employment of accepted statistical methods in arriving at conclusions although not compensating for poor methods or controls would do much in clarifying the significance of such studies.

5 The xanthines are useful in the treatment of Cheyne-Stokes respiration. At times the effect is transient but in other cases the effect may last several hours.

6 Aminophylline is effective in the treatment of bronchial asthma, it finds its greatest field of usefulness in patients who have become epinephrine fast. In general it is less effective than epinephrine and should not supplant the latter.

7 There is no basis for claims that the xanthines effectively reduce high blood pressure.

8 The available evidence is opposed to claims that these drugs are useful in the treatment of peripheral vascular disease.

IODINE AND THE THYROID

Since 1895, when Bannerman discovered iodine in thyroglobulin, a protein isolated from the thyroid, this element has been closely associated with the physiology of the gland. Most of the 30 to 40 mg. of iodine in the body is localized in the thyroid, whose tissue has extraordinary ability to fix and retain iodine.¹ Thyroxin and diiodotyrosine are the two iodine-containing compounds which have been isolated from the hydrolysis products of thyroid protein. However, they account for only about two thirds of the total iodine in the gland, the nature of the combination of the remainder being unknown.

Recent studies have thrown light on the ability of iodized proteins to simulate thyroxin activity. Krauss and Monroe² produced a remission of experimental hyperthyroidism through the use of iodized milk. Therapeutic effects of iodized whole serum protein have been demonstrated in human patients with athyrosis³ and similar results which have been described in guinea pigs treated with iodized casein.⁴ The chemotherapeutic pattern of stimulation by these artificially iodized proteins is probably the same as when desiccated thyroid is used, as shown by successful isolation of thyroxin from the hydrolysis products of iodized casein.

Some indication of the pathway of synthesis of the thyroid hormone has been provided by recent experiments in which radioactive iodine was employed. Mann and his co-workers⁵ injected radioactive iodine into dogs, and the relative amounts of inorganic iodine, diiodotyrosine and thyroxin in the thyroid substance were calculated from the relative specific radioactivities

of these fractions. From the data these investigators concluded that diiodotyrosine seems to be the precursor of thyroxin. Data which might be taken as support for this conclusion were secured by Morton and Chaikoff⁷ from in vitro experiments. Slices of thyroid from dogs, rats and sheep were incubated in a nutrient medium containing radioactive iodine. The medium was then hydrolyzed and both diiodotyrosine and thyroxin which contained the labeled iodine were isolated. The relative proportion of the added radioactive iodine appearing in the two compounds which varied in the different species of animals were such as to indicate that there is a close relationship between the diiodotyrosine and the thyroxin.

The observations here reported emphasize the close qualitative chemical and functional relationship between the thyroid protein and artificially iodized proteins. Quantitatively the thyroid protein is much more potent than the iodized protein thus far prepared. Nevertheless here is the possibility of preparing this active therapeutic agent in the laboratory or on a large scale. With respect to the mode of formation of the thyroid hormone, suggestive evidence is at hand through the use of radioactive iodine.

ALLERGIC TUBERCULOSIS IMMUNITY

Widely accepted views as to the relationship between allergy and immunity in tuberculosis are challenged by Woodruff and Kelly¹ of the Detroit Tuberculosis Sanatorium. In a recent summary Rich² concluded that allergy is not a necessary accompaniment of an effective immunity in any infectious disease. This conclusion was based largely on experiments³ which indicated that allergic guinea pigs given desensitizing doses of tuberculin are able to withstand subsequent infection with highly virulent strains of tubercle bacilli as well as control guinea pigs left in their original hypersensitive state. This result is of practical clinical interest, since it suggests that tuberculin therapy is without deleterious effects.

Subsequently Willis⁴ questioned the experimental basis for this conclusion, since he found that there was but slight difference between allergic and desensitized guinea pigs if given massive test doses of highly virulent tubercle bacilli but that the results were quite different with smaller or less virulent doses. With doses that allow the injected animals to remain alive for at least six months, a 100 per cent mortality of the tuberculin desensitized animals took place long before all nondesensitized controls had died. Moreover, in the desensitized animals the lungs were almost

completely hepaticized by tuberculous pneumonia with little or no involvement of the liver or the spleen. In the allergic controls the pulmonary involvement was minimal, the spleen being the organ showing the maximum predilection to the disease. Lack of acquired allergy was apparently responsible for the free and unrestrained growth of tubercle bacilli in the desensitized lungs.

During the past three years 218 normal guinea pigs have been infected subcutaneously with fatal doses of virulent human tubercle bacilli in the Detroit Laboratory and tested quantitatively for skin sensitivity throughout the course of the disease. In all cases the acquired skin sensitivity increased to a maximum in about four to five weeks. After this the animals could be divided into two groups. In one group the skin sensitivity decreases rapidly after the fifth week, the animals becoming desensitized by about the twelfth week, which spontaneous desensitization was invariably followed by death. On necropsy extensive pulmonary involvement was noted with enormous numbers of tubercle bacilli in the lungs. In the other group the acquired skin sensitivity was not decreased but increased slightly above the five week level. These durallergic animals remained alive well beyond the fourteenth week and on etherization showed but few acid fast bacilli in pulmonary sections or smears.

From such data Woodruff and Kelly conclude that a quantitative relationship between skin sensitivity and pulmonary resistance to tuberculosis exists, non-allergic or spontaneously desensitized pulmonary tissues favoring a profuse local proliferation of the tubercle bacilli. Spontaneous desensitization is demonstrated also in human tuberculous patients.

Current Comment

VENEREAL DISEASE IN THE NAVY

For approximately thirty years, as was mentioned in a previous comment,¹ gonorrhea has consistently remained either in first or in second place among the leading causes of morbidity in the Navy. The over-all admission rate for the entire Navy, according to Lang was 60.61 per thousand for this disease alone. Especially encouraging, therefore, is the report of Comdr. T. J. Carter² on the figures for venereal disease admission to the Navy for the years 1940 through 1942. From these it appears that for the Navy the rate for all venereal disease was 80 per thousand in 1940, was 51 in 1941 and was about 36 in 1942. These figures represent decreases of 36 per cent between 1940 and 1941 and of 29 per cent between 1941 and 1942. The trend is downward by 55 per cent over the three year period. In the suppression of the spread of the

infection, the "place of exposure" assumes real importance. Analysis of the 1942 cases reveals that ten leading cities alone are the source of 41 per cent of all cases in the Navy about which data are available. These ten cities likewise account for 57 per cent of the venereal disease cases originating in the United States. During 1942 only 28 per cent of the Navy venereal disease problem came from foreign ports. Thus the bulk of the problem will remain in the United States for some time to come. The measures proposed by the Special Committee on Enforcement of the National Advisory Police Committee on Social Protection may bring about an even further reduction in these figures.

PREVENTION OF SULFADIAZINE CRYSTALLURIA

A method of preventing "renal irritation" (crystalluria) following sulfadiazine therapy is suggested by detailed studies of the solubilities of sulfadiazine and its conjugation products reported by Gilligan and his colleagues¹ of Cornell University Medical College. Previous clinical data² have shown that the incidence of sulfadiazine crystalluria is higher in acid than in neutral or alkaline urines, suggesting the possibility that precipitation of sulfonamide excretion products in the renal tubules is determined by the p_H level. To test this theory large amounts of acetylsulfadiazine were added to phosphate buffer solutions ranging in p_H from 5.2 to 8.0. The mixtures were shaken for eighteen hours in a water bath at 37 C and then filtered at the same temperature. Analyses of the resulting filtrates by the Bratton technic³ showed an acetylsulfadiazine solubility of about 10 mg per hundred cubic centimeters at p_H 5.2, increasing to about 60 mg at p_H 6.5. With alkaline urines (p_H 7.5) the solubility was over 500 mg per hundred cubic centimeters, a ten to fifty times greater solubility than in acid buffer solutions. Similar data were obtained with free or uncombined sulfadiazine. Clinical studies suggested by these data revealed a 27 per cent incidence of crystalluria following sulfadiazine therapy in 172 cases of acid urine. In 147 urines previously rendered alkaline by oral administration of sodium bicarbonate, only 2 specimens showed crystals. Both cases cleared on further administration of sodium bicarbonate. The conclusion was drawn that sulfadiazine crystalluria can be prevented in all cases by oral administration of this alkali. The dosage necessary to maintain the urine at an alkaline level is of course, variable. From 137 to 195 Gm daily given in six divided doses, is suggested by the Cornell clinicians. This amount is well tolerated and does not give clinical evidence of alkalosis. In renal or cardiac insufficiency Gilligan suggests that such amounts may be contraindicated. Whether or not prophylactic urinary alkalinization modifies the therapeutic efficiency of sulfadiazine has not yet been determined.

SYMPOSIUM ON RELATIONS OF
MEDICINE AND LAW

The Department of Legal Medicine of the Harvard Medical School has announced its sponsorship of a symposium series on scientific proof and relations of medicine and law. The papers comprising the series, fifty-three in number, deal with clinical forensic medicine, forensic pathology, scientific crime detection, modes and mechanisms of scientific proof, medical criminology, expert testimony, private and public law problems of interest to physicians and other equally important interrelationships between medicine and law.

Arrangements have been made for a wide publication of the papers in a number of medical and law journals, some of which are devoting entire issues to the symposium. To enable those interested to know in what journals the individual papers are published a master index to the series has been prepared in booklet form.¹ This symposium represents an ambitious and intelligent effort to clarify some of the problems in which medicine and the law have common interests and to illustrate the breadth of the field in which such problems arise. It should arouse a keener interest in and a fuller understanding of a subject that deserves more thoughtful consideration by both physicians and lawyers than has been given it in this country.

MOSQUITO VECTORS AND ANIMAL
RESERVOIRS OF ENCEPHALITIS VIRUSES

Since the outbreak of encephalitis in St. Louis in 1933 other outbreaks have been recognized as predominantly due to the same virus. Significant observations have resulted from recent field and laboratory studies on this subject in the Yakima Valley, Washington. Both St. Louis and western equine viruses have been isolated repeatedly from one species of mosquito there, *Culex tarsalis* Coq. Antibodies to both viruses have been found in 50 per cent of apparently healthy domestic fowl in that area and also in a high proportion of fowl in other areas. The question was whether this mosquito would become infected and infective with each of these two viruses as the result of feeding on domestic fowl. Hammon, Reeves and Gray¹ report the results of their attempt to reproduce in the laboratory this hypothetical cycle believed to occur naturally (mosquito-fowl-mosquito). They fed fowl on blood virus suspensions and demonstrated transmission not only by *Culex pipiens* and *Culex coronator* as previously reported but also by three other genera of mosquitoes and a tick. Probably in at least one epidemic area (Yakima Valley) both St. Louis and western equine encephalitis viruses were mosquito borne, and the source of mosquito infection was a huge inapparent reservoir among domestic fowl and possibly other vertebrates. Apparently control should be directed primarily at the arthropod vectors, with human vaccination also under special circumstances.

¹ This index may for a brief time be procured from the Editor in Chief of the symposium, Dr. Hubert Winston Smith, Langdell Hall, Harvard Law School, Cambridge, Mass., for 15 cents plus 1½ cents postage.

¹ Hammon, W. McD., Reeves, W. C., and Gray, M. Mosquito Vectors and Inapparent Animal Reservoirs of St. Louis and Western Equine Encephalitis Viruses, *Am. J. Pub. Health* 33: 201 (March) 1943.

ELECTROCARDIOGRAPHIC CHANGES
WITH EXERCISE

In a series of electrocardiographic investigations of normal persons, Barrow and Ouer¹ observed the effects of vigorous participation in various sports and correlated the results with the factors of age, smoking and cardiovascular stability as measured by the Schneider index. The observations were performed on a series of 100 normal men on whom electrocardiographic changes were produced by vigorous participation in such active sports as handball and badminton. Tracings were taken immediately before and immediately after exercise. Significant changes in the auriculoventricular or the intraventricular conduction time were not observed. Inversion of the P wave in lead CF₁ after exercise occurred in about half the group. Changes in the T wave were common, but frank inversion of this wave or distortion of the ST segment was not found. A change in the size of the QRS complex was most common, being found in four fifths of the men in the series. Half of the men studied were under 40 years of age, averaging 31, while the other half were over 40, averaging 49. Significant electrocardiographic differences between the two age groups, however, were not found. Similarly a definite difference in the average rating of the two age groups could not be determined by the Schneider index. Three fifths of the men were smokers; they had a Schneider index slightly lower than the non-smokers. The effects of exercise on the whole were thus not particularly striking, though the authors state that one should be suspicious of intrinsic myocardial damage when distortion of the ST segment or frank inversion of the T wave in significant leads is produced by exercise. Perhaps it is safe to believe that in the majority of instances the legs or other elements of the musculoskeletal system would tend to give out before the heart, thereby serving as a factor of safety.

PROBLEMS OF CONVALESCENCE

The Subcommittee on Clinical Investigation of the National Research Council has decided to bring the problems of convalescence to the attention of investigators and clinicians throughout the country. What is the real nature of convalescence? Why is it frequently prolonged after the fever subsides? Why must there be a period of gradual recuperation after trauma or major surgery? These are problems suggestions in regard to which, with proposals for investigation, are invited. The military importance of these problems is evident when one considers the number of casualties and the importance of prompt rehabilitation for active duty. The value of a better understanding of convalescence in all forms of medical practice is obvious. Suggestions with regard to investigative projects in the field of convalescence should be sent to the Subcommittee on Clinical Investigation, National Research Council, 2101 Constitution Avenue, Washington, D. C.

MEDICINE AND THE WAR

In this section of *The Journal* each week will appear official notices by the Committee on War Participation of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war and such other information and announcements as will be useful to the medical profession

ARMY

WITH GENERAL CHENNAULT IN BURMA AND CHINA

Two years ago while serving as a flight surgeon in North Carolina Lieut Col Thomas C Gentry, M C U S Army, was called to Washington to discuss with Capt Chas L Chennault a retired air corps officer with whom he had previously served, proposed plans for organizing a volunteer group for duty along the Burma Road and in China. Lieutenant Colonel Gentry was authorized by special authority of China's minister Dr T V Soong to hire the necessary personnel to care for about three hundred specialists who were to make up the American Volunteer Group and to buy medical supplies sufficient for twelve months' service in the orient. He bought a portable x-ray unit surgical instruments and supplies blood plasma, antimalarial drugs, vitamins and thirty hospital beds. The medical staff was to include a general surgeon an orthopedic surgeon an internist, an eye, ear nose and throat specialist, a dental officer two female nurses one male nurse, a flight surgeon's assistant, a dental technician one ambulance driver and two first aid men. In the *Military Surgeon* for May Colonel Gentry states that, although malaria has taken a terrible toll for centuries in northern Burma and southwestern China, not a single death due to illness occurred in the American Volunteer Group 'during the year we spent in Burma and China'. While the Burma Road was under construction thousands of workmen died of malaria and two commissions were sent out by the U S Public Health Service to supervise anti-malarial work. The excellent health of the American Volunteer Group is attributed to the physical condition maintained by every member, who even in the extreme heat of Burma engaged in outdoor athletics to the amazement of the natives, also to the fact that all members of the group fully cooperated with the medical members and came to them early when illness developed. Many a pilot in this group owes his life to his physical condition which enabled him to endure repeated air raids and to walk back many miles to his base after forced landings. Eight pilots were lost in accidents incident to routine training flights, only five were actually shot down in combat, seven were killed by fire from the ground while on bombing missions and three others were captured during raids over the enemy lines. The Americans with one hundred planes destroyed five hundred Japanese planes. Flying fatigue became a menace when replacements which had been promised did not arrive and it became necessary for the fliers to stand alert for long periods with no days off. In order that some pilots especially in need of rest might have an excuse for leave from combat duty, Lieutenant Colonel Gentry says that elective operations were performed on a few. This group arrived in Rangoon on Aug 15, 1941 and the U S Army Air Forces took over the American Volunteer Group on July 4, 1942. New personnel and equipment then came from home although about forty veterans of the American Volunteer Group remained with their gallant leader now Major General Chennault.

TWO HUNDRED FLIGHT NURSES

The Army Air Force Air Evacuation Group at Bowman Field Louisville, Ky held graduating exercises recently for a class of two hundred flight nurses who on the following morning staged a demonstration including the rapid conversion of a transport plane into a hospital plane, the removal of wounded from an advanced airfield and the nursing treatment of wounded during flight. Brig Gen David N W Grant the air surgeon, addressed the class and presented the diplomas

THE STATION HOSPITAL AT FORT LEONARD WOOD

The Station Hospital at Fort Leonard Wood, Missouri celebrated its second anniversary on May 3. Fort Leonard Wood, one of the largest army posts in the country, located deep in the Ozark Mountain section of Missouri has a vast hospital with a capacity of about 2,250 beds occupying some 200 acres of rolling countryside.

The commanding officer Col Leeson O Tarleton Medical Corps a graduate of Harvard University in the class of 1910 is serving not only as commanding officer of the hospital but also as station surgeon.

The present staff includes 69 officers, 155 nurses 677 enlisted men and 208 civilians. As of May 1 the professional staff of the hospital was as follows:

ADMINISTRATIVE SERVICE

Col Leeson O Tarleton commanding officer and station surgeon
Major Arthur E Putz executive officer
Major Robert A Murray assistant executive officer registrar and receiving and disposition officer

SURGICAL SERVICE

Col Millard F Arbuckle chief of surgical service
Major Ronald F Elkins chief of proctology section
Major Richard E Speirs ward surgeon
Major George F Swanson ward surgeon
Capt Raymond E Cooper chief of anesthesia section
Capt Thomas E Ferrell Jr chief of clean surgery section
Capt Donald A Kendall assistant chief of surgery service
Lieut Vernon C Watters Jr chief plastic surgery section

(ORTHOPEDIC)

Major Wesley H Burnham chief of orthopedic section
Capt James F Kennedy thoracic surgeon
Capt Hanns C Schwyzer chief of chest surgery section
Lieut Melville Rosenbush chief of physical therapy section

(EYE EAR NOSE AND THROAT)

Lieut Col Leander T Simons chief of eye ear nose and throat section
Major William F Boiler chief of ear nose and throat subsection
Capt Marshall L Soldmeier bronchoscopist
Lieut Stanley S Chunn ward surgeon
Lieut Robert B Stump ophthalmologist

MEDICAL SERVICE

Lieut Col Neville E Stewart chief of medical service
Major Charles R McAdam assistant chief of medical service
Major Armand W Hanss chief of officers and nurses section
Major Howard J Lee chief of general medicine section
Major Franklin O Meister ward surgeon
Capt Robert A Coen ward surgeon
Capt Jacob W Fleming Jr chief of gastroenterology section
Capt Delmar R Gillespie cardiologist
Capt Emil C Vrozek chief of dermatologic section
Capt Ingall H Neas assistant chief of neuropsychiatric section
Capt Philip W Smith chief of urology section
Capt Howard A Stellner ward surgeon
Lieut Usher L Frankel ward surgeon
Lieut Otto E Ramik ward surgeon
Lieut John M Rhodes ward surgeon
Lieut Walker M Turner ward surgeon
Lieut Mervyn H Williams ward surgeon

RADIOLOGY SERVICE

Lieut Col Weaver A Rush chief of radiology service
Major Laura C Pumphrey assistant chief of radiology

OUTPATIENT SERVICE

Capt Carl L Mangiameli chief of outpatient service

LABORATORY

Capt Miles E Foster Jr chief of laboratory service
Capt Julius H de Maciewicz assistant chief of laboratory
Capt Myron S Silverman bacteriologist

SPECTACLES FOR ENLISTED MEN

The Adjutant General's Office, Washington, D. C., issued the following memorandum on May 11:

1. Pamphlet No. 85, War Department, 1943, consolidates all previous instructions and regulations concerning issuance of spectacles. Changes the basis of issue and provides substantially that enlisted men will be issued two pairs of spectacles, if authorized, as soon as possible after date of induction. This issuance will be made at the home station without regard to movement overseas.

2. Until such time as the effect of the instruction contained in Pamphlet No. 85 is achieved, and in the exceptional cases which will arise thereafter, training center commanders are permitted to ship replacements to depots with only one pair of spectacles when time does not otherwise permit. The prescription for obtaining the additional pair of spectacles will accompany the records of the enlisted man to the depot and action will be initiated at that station to have the prescription filled. Personnel will not be detained at depots for lack of these spectacles; the additional pair will be forwarded to them at their proper overseas address.

BRIG GEN GRANT CONTINUES AS
AIR SURGEON

In a readjustment of the functions of headquarters components of the Army Air Forces designed to decentralize control, announced recently by the War Department, the offices of headquarters are reduced from twenty-five to thirteen and there will be six major components of the air staff instead of nineteen as formerly. The headquarters staff of Gen Henry H. Arnold, Commanding General, Army Air Forces, includes among others a chief of air staff, Major Gen George I. Stratemeyer, three deputy chiefs and six assistant chiefs of air staff. A new Office of Special Projects has been created and a new commandant, Army Air Forces Flight Control Commandant, formed. Major Gen Follet Bradley, who has been on special duty at headquarters Army Air Forces, becomes Air Inspector and Brig Gen David A. W. Grant, continues as Air Surgeon.

FORMER COLONEL WEARS
LIEUTENANT BARS

The maximum use of available manpower and the placement of skilled but aged persons is illustrated in the case of a former colonel who wears a lieutenant's bars in order to qualify for an assignment. Dr. Philip S. Potter, pediatrician, had in twenty-four years' work advanced to the rank of colonel in the Medical Reserve Corps, which he entered on discharge as a captain when he returned from France in 1918. While the present war was about to leave him on the sidelines the 68-year-old physician was confident that he could serve. While he has not been called to active duty as a colonel, his experience is being used by the Army at the California Quartermaster Depot, where he now serves as a first lieutenant and thus releases a younger medical officer for duty with troops.

POSTHUMOUS AWARD OF DISTINGUISHED
SERVICE CROSS

Lieut Victor H. Karpas of the U. S. Army Medical Department was awarded the Distinguished Service Cross posthumously, according to the Chicago *Daily News* of April 7, for heroism during the invasion of Algeria last November 2. Lieutenant Karpas, it is said, refused to abandon ship and in the midst of an operation on a wounded sailor he was struck by an enemy shell and killed. Lieutenant Karpas was 33 years of age and a graduate of the University of Illinois School of Medicine, Chicago.

THE FIRST DENTIST PARACHUTE
JUMPER

Lieut Herbert O. Epplen of the U. S. Army Dental Corps, who recently graduated from the Parachute School at Fort Benning, Ga., was the first officer of the dental service to qualify as a parachute jumper. Lieutenant Epplen was assigned to duty with the 503d Parachute Infantry Regiment.

AVIATION MEDICAL EXAMINERS

Another class of aviation medical examiners graduated on March 11. Graduation exercises were held at the School of Aviation Medicine in Texas and at the three army air forces classification centers, where the practical portion of the course was conducted. Following is a list of the students graduated:

ALABAMA

Andrew D. Henderson, Captain,
Mobile
Benjamin I. Jackson Jr., Captain,
Montgomery
William H. Spruell, 1st Lieut.,
Russellville

ARIZONA

Delbert W. Hess, 1st Lieut., Tucson
William P. Holbrook, Lieut Col.,
Tucson
Meyer M. Mindel, 1st Lieut., Tucson

ARKANSAS

Lucas M. Bryd Jr., 1st Lieut.,
Little Rock
Milton C. Jolin Jr., 1st Lieut.,
Shuttleworth
Ely D. Rowland, Captain, Hot
Springs National Park
Carl R. Williams, 1st Lieut., Mor-
rilton

CALIFORNIA

William L. Arko, 1st Lieut., Oak-
land
Anthony G. Badami, 1st Lieut., San
Jose
Richard O. Bagley, 1st Lieut., San
Francisco
Lauris H. Bassett, 1st Lieut., San
Diego
Daniel W. Boullett, 1st Lieut., San
Francisco
Robert B. Case, 1st Lieut., Oakland
Ralph Chapman, 1st Lieut., Los
Angeles
Harry S. Chong, 1st Lieut., Berke-
ley
David Clithero, 1st Lieut., Los
Angeles
Charles B. Cryeroff, 1st Lieut.,
San Jose
Paul H. Cronenweitt, 1st Lieut.,
Mammoth
Roger W. Hackley, 1st Lieut.,
Oakland
Howard Hammond Jr., 1st Lieut.,
San Rafael
Rae F. Hartwell, 1st Lieut.,
Orange
Robert M. Ireland, 1st Lieut., Los
Angeles
Julius Lewis, 1st Lieut., Berkeley
Frank C. McLone, 1st Lieut., On-
tario
John W. Moore, 1st Lieut., Quince
Leslie S. Orleans, 1st Lieut., Los
Angeles
Viron E. Oswald, 1st Lieut.,
Bakersfield
Max L. Salvator, 1st Lieut., Sacra-
mento
Ralph V. Sloan, 1st Lieut., Glen-
dale
Richard A. Warrick, 1st Lieut., Los
Angeles
Don E. Woodward, 1st Lieut., Oak-
land
Ney J. Zahry, 1st Lieut., Bakers-
field

COLORADO

Herbert V. Temple, 1st Lieut.,
Haybro

CONNECTICUT

Joseph B. Hanley, 1st Lieut.,
Terryville
Mayo R. Purple, Captain, New
Haven

DELAWARE

Walter E. Gunby Jr., 1st Lieut.,
Seaford

DISTRICT OF COLUMBIA

Philip A. Cox, 1st Lieut., Wash-
ington
Milton Morton Greenberg, Captain,
Washington
Norman B. Knof, 1st Lieut.,
Washington
Alfred J. Krug, 1st Lieut., Wash-
ington
Oliver K. Niess, Lieut Col., Wash-
ington
Richard K. O'Loughlin, 1st Lieut.,
Washington

FLORIDA

Karl B. Hanson, Captain, Jackson-
ville

Lloyd H. Jennings, 1st Lieut.,
Starke
Joseph I. G. Lester Jr., 1st Lieut.,
Miami
Frederick P. Poppe, 1st Lieut.,
Coral Gables
Raymond R. Sessions, 1st Lieut.,
Kissimmee
Willitt E. Wentzel, 1st Lieut.,
Bradenton

GEORGIA

Joseph L. Berg, 1st Lieut., Augusta
William D. Jarratt, Captain, Macon

IDAHO

John R. Mangum, 1st Lieut.,
Nampa

ILLINOIS

Walter Pope Alvis, 1st Lieut.,
Evanston
Melbourne W. Boynton, Major,
Chicago
John G. Ersfeld, 1st Lieut.,
Chicago
John P. Kieffer, Captain, Chicago
James O. Lawrence, 1st Lieut.,
Chicago (Evanston)
Isidore Lerner, 1st Lieut., Chicago
Barney Malbin, 1st Lieut., Chicago
Wiley R. Marvel, 1st Lieut., Wel-
don
Wesley B. Olver, 1st Lieut.,
Belvidere
Samuel B. Prevo, Major, Marshall
Donald J. Reichert, 1st Lieut.,
Evanston
Julius B. Richmond, 1st Lieut.,
Chicago
Jack H. Sloan, Captain, Chicago
(Highland Park)
William B. Smith, 1st Lieut., Grand
Ridge
Grant Suttie, 1st Lieut., DeKalb
Gilbert Alphon Towle, 1st Lieut.,
Chicago Heights
Lawrence E. Woodard, Captain,
Evanston
Gordon W. Wormley, 1st Lieut.,
Rockford

INDIANA

George W. Dyer, 1st Lieut., Terre
Haute
Gordon H. Haggard, Major, In-
dianapolis
August M. Hasevinkle, 1st Lieut.,
Fort Wayne
Francis P. LaFata, 1st Lieut., Gary
Gilbert G. Lapid, 1st Lieut., East
Chicago
Arthur D. McKinley, 1st Lieut.,
Speedway
James S. Murray Jr., 1st Lieut.,
Indianapolis
Harold E. Ropp, Captain, New
Harmony
Karl W. Vetter, 1st Lieut., Elkhart
Ralph C. Wilmore, 1st Lieut., In-
dianapolis

IOWA

Paul D. Bruns, 1st Lieut., Des
Moines
Jesse L. Cochran, 1st Lieut.,
Carroll
Richard D. Crow, 1st Lieut.,
Shreveport
Thomas R. Dolan, 1st Lieut.,
Greene
John L. Ehrenhaft, 1st Lieut.,
Iowa City
Henry H. Gurau, 1st Lieut., Des
Moines
Robert H. Harris, 1st Lieut.,
Alamosa City
Joseph I. Ptacek, 1st Lieut., West
ster City
Lee E. Rosebrook, 1st Lieut.,
Ames
James W. Standeven, Captain,
Oakland

KANSAS

Spencer H. Boyd, 1st Lieut., To-
peka
Samuel T. Coughlin, Major, Lawrence
James G. Gaume, 1st Lieut., El
wood
Edwin R. Hill Jr., Major, Lawrence

KENTUCKY

Shelby G. Bale, Captain, Louisville

Robert W. Buhart, Captain Fulton
Walter R. Byrne, Captain Russellville
Arch M. Carr, 1st Lieutenant, Middleboro
Paul E. Harper, 1st Lieutenant, Drybridge
William M. Townsend, 1st Lieutenant, Falmouth

LOUISIANA

James E. Ball, 1st Lieutenant, Shreveport
Orion E. Dalton, 1st Lieutenant, New Iberia
John F. Daniel, 1st Lieutenant, New Orleans
John S. Herring, Captain, New Orleans
Charles S. Hottel, Jr., 1st Lieutenant, Shreveport
Edward Perry Thoma, Captain, New Orleans
Lee William on, 1st Lieutenant, New Orleans

MAINE

Philip B. Thomas, 1st Lieutenant, Bangor

MARYLAND

Joseph M. George, Jr., 1st Lieutenant, Sudlersville
William A. Horley, 1st Lieutenant, Baltimore
Saul J. Robinson, 1st Lieutenant, Baltimore

MASSACHUSETTS

Joseph A. Daly, 1st Lieutenant, Natick
Harry L. Day, Captain, Worcester
Sam on Fisher, Captain, Revere
Ray S. Gilmore, 1st Lieutenant, Lowell
Bernard Rapoport, 1st Lieutenant, Boston
Norman Simon, 1st Lieutenant, Lawrence
Roger A. Violette, 1st Lieutenant, Fall River
James F. Whitten, 1st Lieutenant, Amesbury

MICHIGAN

Donald K. Barstow, 1st Lieutenant, St. Louis
Thornton I. Boileau, 1st Lieutenant, Detroit
George E. Clark, Jr., 1st Lieutenant, Detroit
George R. Clutton, 1st Lieutenant, Mason
Theodore R. Florentz, 1st Lieutenant, Detroit
Edward H. Lass, 1st Lieutenant, Oxford
Harold A. Machin, 1st Lieutenant, Kalamazoo
Paul H. Muske, 1st Lieutenant, Detroit (Dearborn)
William G. Robinson, 1st Lieutenant, Hart

NAVY

IOWANS DONATE EQUIPMENT TO
NEW BATTLESHIP

The Medical and Surgical Relief Committee of America has presented the new 45,000 ton battleship U S S *Iowa* with six emergency field sets, six operating kits and other medical supplies with a total value of more than \$3,000. Dr. Walter L. Biering, health commissioner of Iowa and chairman of the Iowa division of the Medical and Surgical Relief Committee, said that the committee has received further requests from the *Iowa*. All kinds of dental instruments are urgently needed as well as one hundred operating rooms, transmission apparatus and other medical supplies. Dr. Harry Hurd of Des Moines is launching a campaign to raise funds to meet the dental needs of the *Iowa*. All funds raised will be turned over to the new battleship and where possible equipment purchased by Iowans will carry a plaque inscribed with the name of the donor. Contributions should be sent to the Iowa representatives of the Medical and Surgical Relief Committee, Dr. Walter L. Biering, Dr. Harry Hurd and Dr. Robert I. Parker of Des Moines, Dr. Rose I. Butterfield of Indianapolis, Iowa or directly to the committee headquarters, 120 Lexington Avenue, New York.

MEDICAL KITS FOR PATROL BOATS

The Women's Auxiliary to the Kent County Medical Society, Grand Rapids, Mich., residents of Cleveland and others contributed funds for the purchase by the Medical and Surgical Relief Committee of America, 120 Lexington Avenue, New York City, of ten emergency medical kits for the coast guard patrol boats of the Ninth Naval District at Cleveland. This is the first of a shipment of fifty kits to patrol boats of the thirteen naval districts of the coast guard and to the submarine chasers of the Navy. These portable medical kits are filled with essential drugs and emergency instruments and are complete enough to cope with casualties until the ship reaches a base hospital. Detailed instructions are included in the kit so that it may be used by the pharmacist's mate or other members of the crew in the absence of a physician. The kit also contains mirrors for signaling, a simple fishing outfit and bait, and vital tools in case the crew has to take to the life rafts.

To equip emergency medical kits the Medical and Surgical Relief Committee of America has launched a salvage campaign

urging women and sportsmen to collect small knives, especially wooden handled knives, scissors, tweezers, mirrors, bandages and safety pins, and discarded fishing lines, reels, hooks and sinkers. The committee requested all physicians who attended the recent annual meeting of the New York State Medical Society in Buffalo to bring with them any spare or discarded instruments and surplus drugs as a contribution to this and other phases of its work. The medical members of the National Advisory Committee of the Medical and Surgical Relief Committee include Rear Admiral Ross T. McIntire, Surgeon General, U S Navy; Dr. Stuart L. Craig, Lieut. Comdr. Carnes Weeks, Dr. Conrad Berens, Dr. Joseph Felson, Dr. Morris Fishbein, Dr. Franz Groedel, Dr. Malcolm Goodridge, Dr. Crenshaw D. Briggs and Dr. Marjorie E. Reed.

LIEUT. RITTER A PRISONER OF
THE JAPANESE

Mrs. Edward F. Ritter, Mattoon, Ill., has been officially informed, it is reported, that her son, Lieut. Edward F. Ritter Jr. of the U S Navy Medical Corps, is a prisoner of the Japanese in the Philippine Islands. Lieutenant Ritter graduated from Harvard and received his M.D. degree from Northwestern University Medical School in 1938. After serving a year's residency at Passavant Hospital, Chicago, he was transferred to a Naval hospital in New York and was sent to the Philippine Islands about a year and a half before the attack on Pearl Harbor.

NAVY CROSS AWARDED TO DR. PRATT

Lieut. Comdr. Theodore C. Pratt, MC, USNR, on leave of absence from the surgical staff of the Massachusetts General Hospital and of the Palmer Memorial Hospital, has been awarded the Navy Cross "for extraordinary heroism and distinguished service in line with his profession as chief surgeon of a division field hospital on Guadalcanal." The citation states that Dr. Pratt courageously operated on and supervised treatment of casualties while the hospital was being bombed by enemy planes and shelled by surface craft during last August and September.

CIVILIAN DEFENSE

OFFICE OF CIVILIAN DEFENSE ADVISES
GAS CLEANSING STATIONS AT
HOSPITALS

Hospitals should make complete plans for the immediate establishment, when needed, of "gas cleansing stations" for the care of injured persons who have been exposed to war gases, the Medical Division of the Office of Civilian Defense advised on May 25 in Operations Letter No. 124 (Supplement No. 4 to Operations Letter No. 42). Large communities should establish at least one gas cleansing station without delay for training purposes.

The OCD recommends that the term "gas cleansing" be used to describe the procedure of removing vesicant liquids from persons and that the term "decontamination" be reserved for areas and objects.

The primary purpose of gas cleansing stations is the protection of hospitals and casualty stations and their staffs and patients from contamination by injured persons who have been exposed to vesicant agents, the operations letter points out. Contaminated persons who are not disabled are expected to cleanse themselves in the nearest private home or in other local facilities.

Existing facilities in casualty receiving hospitals must be converted into gas cleansing stations, it is pointed out, since, under present conditions of scarcity of materials and manpower, con-

struction of new facilities is generally not justified. Hospital facilities that should prove suitable are suggested as follows: hydrotherapy rooms, nurses' or interns' locker and shower rooms, part of the outpatient department, garages or other separate structures. In the event that these are not available, facilities to care for persons who are both injured and contaminated must be arranged in schools, gymnasiums, swimming pools, shower rooms, club houses and community centers.

Cleansing stations should be equipped to take care of one third to one half of the hourly casualty receiving capacity of the hospital to be served, the OCD recommends. The professional staff will consist of mobile medical teams assigned when the station is activated, supplemented by additional attendants from the Emergency Medical Service. In addition to cleansing and emergency treatment, the staff of the gas cleansing station will assist in undressing the injured, moving stretchers, caring for clothing and valuables, maintaining supplies and dressing wounds.

It is recommended that cleansing stations be established at or near hospitals and casualty stations which they are to serve. Every hospital that may be required to handle an appreciable number of casualties should have access to such cleansing station facilities.

The local chief of Emergency Medical Service is responsible for the development of these stations, with the advice of the senior gas officer of the community.

MISCELLANEOUS

ARMY-NAVY E AWARDS

Brig Gen Fred W Rankin of the Surgeon General's Office and President of the American Medical Association made the presentation of the flag at ceremonies at which the Army-Navy E Production Award was made to the Seamless Rubber Company, New Haven Conn, and Capt Reynolds Hayden medical officer of the Third Naval District, presented the E insignia to representatives of the employees of the company.

In recognition of the volunteer services of Nassau County physicians in the blood donor work conducted by the Nassau County Red Cross, the Army-Navy E award which the blood donor unit has been given was forwarded on March 30 to the Nassau County Medical Society in Mincola N Y. Local physicians are in constant attendance at all blood donor sessions which are scheduled in villages throughout the county. The time schedules are arranged so that physicians relieve one another when necessary but one doctor at least is always present to conduct the necessary examinations.

The following additional industrial plants have been granted the Army-Navy E award for outstanding performance on war work: the Cleveland Dental Manufacturing Company, Cleveland; the Norwich Pharmaceutical Company, Norwich N Y; M & R Dietetic Laboratory, Inc., Columbus, Ohio; Armour and Company and the Armour Laboratories, Union Stockyards, Chicago; The Kelley Koett Manufacturing Company, Covington Ky; E R Squibb and Sons of Brooklyn and New Brunswick, N J who were granted the Army-Navy E award in September 1942 have added a star to their E pennant as an outward symbol of the renewal for another six months of this award.

Hynson, Westcott & Dunning, Inc., Baltimore manufacturers of drugs, and its employees were presented with the Army-Navy E Award in ceremonies held at the Hotel Belvedere in that city on April 12.

DETROIT RANKS SECOND IN BLOOD DONATIONS

Although fourth in population among American cities Detroit stands second in its volume of blood donations. The chairman of the Detroit Blood Donor Service Committee is Frederick S Stearns, chairman of the board of Frederick Stearns & Company, a Detroit drug manufacturing concern. Mr Stearns became chairman of the Blood Donor Station in January 1942 and by mid-April the number of donors in the Detroit area had reached 162,153. March a record month saw 24,181 volunteers donate 21,298 pints of blood. Mr Stearns has organized volunteer groups in many manufacturing plants. Three mobile blood donor units cover the metropolitan area within 40 miles of Detroit and these are booked solidly up to July. A substation at the Ford River Rouge plant processes an average of 200 donors a day. Blood donor honor rolls are prominent on the walls of this plant and there is interdepartmental rivalry for the highest donor total. Chairman Stearns credits the Detroit record to the application of a well known merchandising principle: correct treatment of the 'customer' so that he keeps coming back. Of the 21,000 donors in March of this year more than 9,000 of them had previously donated blood.

MEDICAL AND SURGICAL RELIEF COMMITTEE

The Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York City, shipped fourteen medical field sets last month to nine Caribbean ports to aid in the medical care of the survivors of torpedoed ships and twenty-two more emergency medical field sets are ready for shipment by the committee to other Caribbean ports. In its three years of work which is conducted by a nationwide group of physicians, the Medical and Surgical Relief Committee of America has distributed more than a half million dollars worth of medical and surgical supplies to the people and fighting forces of the United Nations. The medical director of the committee is Dr Joseph P. Hoguet.

RUSSIAN WAR RELIEF, INC

Shipments from Russian War Relief, Inc. with headquarters at 11 East Thirty-Fifth Street, New York, to the Soviet Union left American ports in the first quarter of 1943 at the rate of \$1,000,000 a month and the total of medical supplies, clothing, tools, seeds and knit goods up to March 31 of this year had a value of more than \$3,000,000, and in addition the organization had relief supplies on hand awaiting shipment or in transit, purchase commitments and records of previous shipments which amounted to nearly \$5,000,000 as of March 31. While, since the inception of this corporation in 1941, Russian War Relief has shipped and entered into purchase commitments for goods valued at nearly \$8,000,000. Edward C. Carter, president of the relief agency, told the board of directors in New York April 26 that the bank reserve and incoming cash contributions and war chest allocations of the relief agency are being used to purchase supplies requested by Soviet authorities as quickly as they can be ordered or found available.

INNOVATORS OF SCIENCE

GRIGORY SHAKHOV

[NOTE—By cable from Russia comes the following account of medical progress in Russia.—ED.]

Col. Alexei Maximenko of the Red Army Medical Service spent the bitter winter of 1941-1942 in Leningrad finishing scientific work to which his teacher had devoted a good half of his long life.

Neither incessant enemy air raids nor artillery bombardments, neither hunger nor cold prevented him from working with a group of artists on the production of a tremendous atlas. Only once did he leave his work to go out on the roof when the house in which he was living was showered with enemy incendiary bombs. Then part of the fruit of many years of work was consumed by flames. By the end of 1942 the Atlas of Nerve and Vein Systems was completed. The initiator and principal producers of the atlas were duly recognized by the nation and were awarded first class Stalin prizes.

Twenty years ago semiliterate young shoemaker Alexei Maximenko was working as a medical orderly on the civil war front. There he first came in touch with medicine. After the civil war Maximenko attended one of the many preparatory schools known as workers' faculties which the Soviet government opened. Ten years later in 1931 he was graduated from the Academy of War Medicine of which he now is professor.

Victor Shevkunenko did not select Maximenko as his pupil and leading assistant by chance. Shevkunenko concluded that the organism of man follows laws discovered by Darwin concerning changing of species. He undertook the task of determining the law of anatomic differences. The atlas contains that part of his observations which is most developed: the greatest possible deviation from normal in structure of the peripheral nervous system and the vein system.

After visiting all main scientific centers in Europe and the United States of America at the expense of the Pirogov stipendium, Maximenko returned home and for twenty years engaged in surgical and topographic anatomy at the same time working in the clinic. During this period in the department which he directed over four hundred and fifty scientific papers appeared, forty professors, fifty lectures and a large number of assistants received diplomas. His researches and those of his students who numbered some one hundred and fifty persons finally took a completely new direction in applied anatomy—that of clinical anatomy. The material which Victor Shevkunenko and a large number of doctors collected in the space of thirty-five years was a result of the study of anatomic deviations in the structure of man from Maximenko's Atlas.

In wartime says Alexei Maximenko, this material has tremendous significance. In this war the number of limb injuries is extremely great and thousands of doctors every day meet various surprises when treating them.

ORGANIZATION SECTION

OFFICIAL NOTES

DOCTORS AT WAR

Radio broadcasts of Doctors at War by the American Medical Association in cooperation with the National Broadcasting Company and the Medical Department of the United States Army and the United States Navy are on the air each Saturday at 5 p. m. Eastern War Time (4 p. m. Central War Time, 3 p. m. Mountain War Time, 2 p. m. Pacific War Time). An exception is the Chicago area where the broadcasts are heard by transcription at 10:30 p. m. Saturdays over Station WMAQ.

The titles and guest speakers for the first three programs are as follows:

- June 5 Medical Discoveries in Wartime
Speaker: Dr. Morris Fishbein, Editor of *The Journal*
- June 12 Doctors for Tomorrow
Speaker: Brig. Gen. Fred W. Rankin, M. C., A. U. S., President of the American Medical Association
- June 19 Report to America—See special announcement

SPECIAL BROADCAST, DOCTORS AT WAR, JUNE 19

The closing program of Doctors at War, scheduled for June 19, will be entitled "Report to America." On this program will appear two Army medical officers broadcasting by short wave from two foreign theaters of war, one Navy officer broadcasting from a foreign theater and one Navy officer broadcasting from a home base. The names of these officers and their locations are not divulged in advance, for military reasons. For the same reason, their subjects will not be announced. We are assured, however, of fresh and timely material arising out of the immediate medical situation in the Army and the Navy. Four doctors actually at war will make a first hand report to America.

This broadcast has been made possible through the generous cooperation of the National Broadcasting Company in arranging the short-wave pickups from foreign advance bases.

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status—S. J. Res. 16 has passed the Senate, authorizing an appropriation of \$500,000 to construct at St. Lawrence Newfoundland a hospital, dispensary or other memorial in token of the appreciation of the United States to the people of St. Lawrence for saving the lives of officers and men of the U. S. S. *Pollux* and the U. S. S. *Triniton*, wrecked near that community in 1912. H. R. 997 has been reported to the House proposing to amend the National Defense Act of June 3, 1916 by eliminating the Medical Administrative Corps in the Medical Department of the Regular Army and substituting therefor a Pharmacy Corps. H. R. 2713 has passed the House making appropriations for the Navy Department and the naval service for the fiscal year ending June 30, 1944. The bill provides that the appropriations for the Naval Establishment may be used for the pay of commissioned medical officers who are graduates of reputable schools of osteopathy.

Bills Introduced—H. Res. 230, submitted by Representative Kelley, Pennsylvania, proposes to authorize the House Committee on Labor (1) to ascertain by investigation the extent and character of aid now given by the federal, state and local governments and private agencies to the physically handicapped, (2) to investigate the diffusion within the United States of such aid to the physically handicapped and (3) to ascertain the employment opportunities obtaining for the physically handicapped. H. R. 2657, introduced by Representative O'Connor, Montana, provides that, whenever the Secretary of the Interior shall find that the Bureau of Indian Affairs is unable to obtain the services of a sufficient number of physicians and dentists who are citizens of the United States adequately to perform the functions of the bureau with respect to the conservation of the health of Indians, he may, with the approval of the Civil Service Commission, engage the services by contract or otherwise of competent physicians and dentists who are not citizens, for periods of time not to extend beyond the termination of the war and six months thereafter. H. R. 2761, introduced by Representative Andresen, Minnesota, proposes to establish a Civilian Supply Administration with authority, among other things, to ascertain the quantities and types of goods and services, including but not limited to food, clothing, shelter, fuel, transportation and medical care, necessary to keep the civilian population healthy and functioning effectively and to apply to

the appropriate government agencies for the amounts and types of manpower, materials, facilities, transportation and other resources determined to be essential to produce and distribute the necessary goods and services.

STATE MEDICAL LEGISLATION

Alabama

Bills Introduced—S. 41 proposes numerous amendments to the existing law relating to the reporting of births and deaths. Its general purpose is to conform the Alabama law with the vital statistics laws of other states. S. 70 and H. 310 are companion bills and provide for the sexual sterilization of certain inmates who have been committed to hospitals for the insane in the state as a condition to the release or discharge of such inmates, of certain persons who have been lawfully committed to institutions for the treatment of mental defectives or feeble minded, of certain inmates of the state penitentiary who are sexual perverts, sadists, homosexualists, masochists, sodomists or afflicted with any grave form of sexual perversion or constitutionally inferior recidivists, of certain inmates of any reform school, industrial school, or training school or reformatory, and of certain other persons not inmates of any institution who are found by the county board of censors of the county medical society of any county in the state to suffer from a mental deficiency transmissible to offspring. H. 367 proposes to enact a food, drug and cosmetic act.

California

Bills Enacted—A. J. R. 49, adopted, May 5, memorializes Congress to consider the advisability of making an appropriation to provide funds for paying women in training to become trained nurses a salary during their years of training. A. 326, approved May 18, amends the existing law relative to the practice of nursing so as to permit the rendering of nursing services by unlicensed persons during a national emergency arising out of war or during an epidemic or other public disaster (chapter 271 Laws of 1943). A. 928, approved, May 15, defines cannabis sativa as the male or female of any species commonly known as cannabis sativa, hemp, Indian hemp or marihuana (chapter 428 Laws of 1943). A. 945, approved, May 13, provides for the issuing of temporary certificates to practice pharmacy valid to

a period of six months (chapter 392 Laws of 1943) A 1171 approved, May 15, provides for the appointment by the board of medical examiners of one or more committees to determine (1) whether an applicant fulfils all of the requirements for the certificate for which he is applying (2) where an examination is required, whether the applicant shall be admitted to the examination and the terms and conditions of his admittance and whether he fails or passes, (3) whether a recommendation should be made to the members of the board that the certificate applied for be issued The purpose of this law is to expedite the granting of licenses to practice medicine (chapter 471 Laws of 1943) A 1174, approved, May 15 provides a method by which a revoked or suspended license to practice medicine may be reinstated after one year has elapsed from the date of revocation or suspension (chapter 472 Laws of 1943)

Colorado

Bills Enacted—H 323, approved, April 22 appropriates to the state board of health the sum of \$12 000 for the purchase of a portable photoröntgen (x-ray) unit to be used for the prevention and control of tuberculosis H 572 approved, April 28 provides for the establishment and maintenance of public hospitals in counties of the state to be controlled by boards appointed by the county commissioners Each such board will consist of seven members none of whom may be either a practicing physician or an elective or appointive state, county or city official The new law provides that every county hospital established under it may accept pay patients

Connecticut

Bill Introduced—H 1383 provides that any graduate of an approved medical school may serve as a resident physician in any state-aided hospital for the duration of the war and for not more than six months thereafter if the written consent and approval of the Connecticut medical examining board has been obtained

Florida

Bill Enacted—H 335 which became a law without the governor's approval May 12 authorizes the city of Miami to levy an annual tax not to exceed 4 mills on the dollar on the real and personal property within the limits of the city for the purpose of maintaining and operating a hospital

Bill Introduced—H 679 proposes to create a board of psychological examiners to examine applicants for licenses to practice psychology defined "as the use and practice of any and all psychological arts sciences methods or procedures, now known or hereafter to be known, for the prevention relief or

cure of mental or nervous maladjustments, ailments or diseases, including suggestotherapy, hypnotherapy, psychotherapy, psychoanalysis and other similar arts, sciences, methods, or procedures"

Illinois

Bill Enacted—H 8, approved, May 12 imposes a duty on each county to provide funds for the treatment of persons afflicted with cancer or tumor who are unable to pay for such treatment If the general funds of the county are insufficient to pay for such treatment, a special tax may be levied and collected for that purpose The county board of each county will appoint a duly licensed physician to examine applicants for the benefits provided by this law

Bill Introduced—S 468 proposes to amend the Non-Profit Hospital Service Plan Act to provide that before a contract with any subscriber becomes effective, and as a condition precedent the subscriber must submit to a medical examination before some physician to be designated by the corporation and a copy of the physician's report must be attached to and become a part of the contract

Nebraska

Bills Introduced—Legislative Bill 441 proposes to amend the premarital examination law to provide that no person shall make a charge in excess of 1 dollar for making an examination under the terms of the act Legislative Bill 442 proposes to amend the prenatal examination law to provide that no person shall make a charge in excess of 1 dollar for an examination made under the law

Rhode Island

Bill Enacted—H 668 approved, April 27 appropriates the sum of \$25 000 to be expended under the direction of the state director of health for the hospitalization of wives and children of men in the armed services below the grade of commissioned officer who are unable to pay for such hospital care

Wisconsin

Bill Enacted—A 305, approved May 18 imposes an annual registration requirement on persons engaged in the practice of medicine and surgery, osteopathy or osteopathy and surgery in the state, registration to be effected in the month of January in each year The registration fee is to be fixed by the state board of medical examiners for each year but may not exceed \$3 in any year The registration requirement will be inapplicable to any physician while serving in the armed forces of the United States or of an allied government (chapter 155 Laws of 1943)

Bill Introduced—A 601 proposes to amend the workmen's compensation act so as to permit chiropractic services to be supplied by an employer in lieu of medical treatment

MEDICAL ECONOMIC ABSTRACTS

SHAWNEE COUNTY (KAN) PLAN

Seven months of successful experience with a prepayment plan for dependents on a more comprehensive scale of operation and with several novel features now affords some valuable suggestions to the many state and county medical societies now operating or contemplating the starting of similar plans Shawnee County which includes the city of Topeka has a population of over 90 000

The agreement between the Shawnee County Medical Society and the Shawnee County Board of Social Welfare and the State Department of Social Welfare provides that all cases for Old Age Assistance Aid to Dependent Children and General Assistance may receive the benefits of medical care, if they choose to do so by the payment of \$3 per month These payments for General Assistance cases are made directly by the welfare agencies either monthly or at six months intervals in advance¹

It was mutually agreed that all assistance cases persons or patients affected shall have a free choice of physicians participating

The county medical society agrees to furnish ordinary and reasonable medical and surgical care compatible with the standards and ethics established by the profession and within the ability and scope of the participating physicians and within the customary and usual practice of the physicians whereby the well being of patients is assured by providing them with the best possible medical care including ordinary and reasonable hospitalization, drugs and medicines, and specialized services when such are approved by the county medical society and when such drugs and medicines are included in a prescription issued to patients by participating attending physicians It is understood however that the services include only those which are deemed to be essential to the needs and welfare of patients and which are approved by the county medical society

The following services are not included surgery and treatment not within the customary and usual practice of the participating physicians surgery and treatment for which necessary equipment facilities or incidentals are not available or provided dentistry nursing appliances including eye glasses and services available through other agencies

Careful preparation preceded the inauguration of the plan All members of the county medical society were questioned as

to willingness to cooperate and the capacity in which they wished to serve.

On the basis of the replies to the questionnaire, 28 members were assigned to home call service, 10 to the clinic staff and 11 for specialized services in their offices or in hospitals. The Shawnee County Medical Society was particularly fortunate in this step of the organization as the city of Topeka turned over to the society all the facilities in its new modern and moderately equipped city clinic rooms. With these facilities the society was able to set up fourteen specialized clinics in addition to the general medical clinic which is held daily, each doctor serving an average of two hours each week. In addition to the medical clinic, the following clinics are now in operation: surgery, gynecology, eye, ear, nose and throat, pediatrics, proctology, tuberculosis, child welfare, diabetic, neuropsychiatric, intertrium, dermatology, urology, cardiology and venereal disease. When surgical operation is required the patient may also choose any surgeon in the society to do what is necessary. A druggist is employed by the society at the clinic to fill the prescriptions during clinic hours. Emergency prescriptions are either filled by the druggist or supplied by the attending physician from a kit issued by the dispensary. The average number of prescriptions issued in a month is around eighteen hundred.

MEDICAL PLANNING IN SOUTH AFRICA

The Federal Council of the South African Medical Association at its meeting on April 26, 1941 appointed a planning committee to study and prepare proposals regarding the organization of medical care.¹ This committee considered its task to be:

- (a) Pointing out clearly the defects of present day services.
- (b) Stating what should be aimed at in an ideal service.
- (c) Describing the various practical methods that might be adopted to arrive at this ideal.
- (d) Attempting to arrive at unanimity in the profession in recommending the adoption of some particular scheme for the improvement of health services and to do everything possible to press for such a scheme being put into operation by the government.

The association had previously adopted a resolution to support a national health insurance scheme introduced by the government, but, when the committee conducted a referendum to determine whether this action still represented the opinion of the medical profession, a vote of 113 to 95 was registered against the support of the resolution.

As a first step the members of the association were urged to suggest plans and express themselves fully concerning the most

desirable action to be taken. There was an extensive response, so that articles on planning have appeared in practically every number of THE JOURNAL since that of the 10th of May 1941. A wide variety of proposals for plans were received, several of which were endorsed after discussion by one or more divisions of the association.

As the next step the committee classified these plans as far as possible and has now asked for another referendum to determine the attitude of the medical profession and afford a guide toward action. In the first referendum about 10 per cent were in favor of the present system, or the maintenance of the status quo. The plans of those who desired some change fell into two classes: "(a) Those retaining private practice as an integral part of the health services. (b) Completely socialized health services. Private practice would not be prohibited but would not be an integral part of the scheme."

The first question asks the physicians to state which of these two classes of plans is preferred. A brief sketch of each of the proposals is then given with opportunity to indicate a choice or modifications of some of the plans. Altogether a yes or no vote is requested on twenty-three questions indicating a preference for a correspondingly wide choice of proposals. It is hoped in this way to obtain a fairly accurate picture of the attitude of the profession, on a wide variety of proposals which will form a basis for further action.

The proposals to be voted on cover a wide field. The multiple benefit society, a form of contract practice, is rapidly expanding and it has recently received official government encouragement. An earlier vote indicated a certain amount of support for this type of practice but on the other hand, there were more votes against it than for any of the other forms of organized service suggested. National health insurance is regarded by a fair number of practitioners as a "logical first step to be taken in the direction of an organized medical service," although nowhere does there seem to be anything like complete satisfaction with it either on the part of the profession or the public.

There are a number of plans that are classified as "socialized medicine," since "private competitive practice is not contemplated as an integral part of any of them," although it will not be forbidden or even discouraged. All such plans contemplate: (a) Cutting at the roots of ill health by drastic reforms in such fields as nutrition, housing, physical education, rehabilitation and social security generally. (b) Unified control of all health activities. (c) State finance and cooperation with other state departments. (d) Representation of medicine and allied professions in administration and control. (e) Health education. (f) Health conservation.

¹ A Health Service for South Africa. South African M. J. 16: 425 (Dec. 26) 1942.

WOMAN'S AUXILIARY

New Jersey

A joint meeting of the Contemporary Club of Newark and of the Woman's Auxiliary to the Essex County Medical Society was repeated by request on January 26. Invitations were sent to all social organizations, public health and welfare agencies, as well as hospital representatives and nurses. The speakers were introduced by Dr. William W. Cox, president of the Essex County Medical Society. Lieutenant Jean Robb of the Woman's Auxiliary Army Corps spoke on the purpose of the Waacs. Dr. J. Wallace Huff talked on "Medicine in War" from the civilian doctor's point of view. Dr. Stuart Z. Hawkes spoke on "Medicine in War" from the military angle.

Mrs. Max Kummel, chairman of public relations of the auxiliary, and Mrs. Frank A. Bien were the joint chairmen of this program.

Pennsylvania

A meeting of the Allegheny auxiliary in Pittsburgh recently was called to order by the president, Mrs. Robert C. Hibbs, who announced that \$1,700 had been turned over to the Student Loan Fund by the auxiliary. This fund, which has been in existence for twelve years, was organized for the benefit of

needy medical students of the University of Pittsburgh. Early in the year a request was made by the university. The auxiliary was happy to respond with the amount stated, which is the largest ever given by the auxiliary since the fund was started.

The food mart, under the chairmanship of Mrs. N. Park Davis with Mrs. Henry D. Jorden as co-chairman, proved a great success. The cakes, pies, cookies, rolls, preserves and jellies were donated. Members also contributed handwork. The proceeds, nearly \$470, will go to the Student Loan Fund.

West Virginia

At the nineteenth annual meeting of the Woman's Auxiliary to the West Virginia State Medical Association at Charleston May 17 and 18, Mrs. John P. Helmick of Fairmont was installed as president, succeeding Mrs. Ralph Hogshead of Mammoth. Other officers installed were Mrs. H. P. Evans of Keyston, Mrs. W. E. Hoffman of Charleston, Mrs. N. L. Harsh of Wheeling and Mrs. H. D. Gunning of Ronceverte as vice presidents, Mrs. J. W. Carney, Logan, recording secretary, and Mrs. S. W. Davis, Fairmont, corresponding secretary. Mr. Scott A. Ford, Edwight, is the president-elect and will take office at the annual meeting in 1944.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

CALIFORNIA

Dr Soiland Honored—The Radiological Section of the Los Angeles County Medical Association gave a dinner May 5 in honor of Capt. Albert Soiland (MC), U.S.N.R., celebrating his seventieth birthday. In 1933 the sixtieth birthday of Dr. Soiland was celebrated by the dedication to him of the May issue of *Radiology*. A founder of the American College of Radiology, serving as its president in 1931, he was also a sponsor of the plan to establish the Section on Radiology of the American Medical Association and in 1926 was elected its chairman.

University Appointments—Dr. Ernest D. Gardner, instructor in anatomy at Stanford University School of Medicine, San Francisco, has been appointed assistant professor of anatomy at the University of Southern California School of Medicine, Los Angeles, and Dr. Arnold Lazarow of the department of anatomy, University of Chicago School of Medicine, has been named research assistant in the department of anatomy at Southern California. Dr. Jurgen Ruesch of Zurich and Basel has been appointed lecturer in psychiatry at the University of California Medical School, San Francisco. Since the outbreak of the war he has held a Rockefeller Foundation fellowship and has been working in Boston hospitals and at the Harvard Medical School. *Science* reports.

ILLINOIS

New Reportable Diseases—Effective on May 15 the following have been added to the list of reportable diseases in Illinois: rheumatic fever, hemorrhagic jaundice (Spirochetosis, icterohemorrhagica, Weil's disease), infectious hepatitis (acute catarrhal jaundice), infectious keratoconjunctivitis (superficial punctate keratitis, nummular keratitis).

Chicago

Dr. George Gardner Named Assistant Dean at Northwestern—Dr. George H. Gardner, associate professor of gynecology at Northwestern University Medical School, has been appointed assistant dean and Dr. Alexander A. Day has been named acting assistant dean in place of Lieut. Col. Harold A. Davenport, M.C., A.U.S. Dr. Gardner graduated at Johns Hopkins University School of Medicine, Baltimore, in 1921, serving there on the faculty until 1926, when he joined the staff at Northwestern as clinical assistant in gynecology. He is president-elect of the Chicago Gynecological Society.

The Ricketts Prize—The Howard Taylor Ricketts Prize of the University of Chicago has been divided between Dr. Howard C. Hopps, instructor in pathology, and Leo R. Melcher, Ph.D., formerly assistant in immunology in the department of bacteriology and parasitology and now a student at Northwestern University Medical School. Dr. Hopps's research showed that although some allergy-causing substances may hinder the healing of wounds, if they are used in treatment of catgut, used in wound repairs and often suspected of having this effect, actually is not responsible. Dr. Melcher's work concerned the analysis of the substances in the worm *Trichina* which cause immunity in the disease of trichinosis. Dr. Hopps graduated at the University of Oklahoma School of Medicine, Oklahoma City, in 1937 and two years later joined the department of pathology at the University of Chicago. Dr. Melcher graduated at the University of Chicago in 1939 and received his Ph.D. in 1942.

Michael Reese Hospital Launches Program of Medical Teaching—The Michael Reese Hospital has inaugurated a program of medical teaching which is to be developed first on an intramural basis but which will gradually be merged into postgraduate teaching available to the medical profession at large. It is hoped that the program will be sufficiently advanced by the end of the war to help meet the demand for refresher courses for physicians now in the armed forces. The part-time and full-time staffs of the clinical departments of the hospital and the full-time staffs of the Research Institute and of the clinical laboratories will all contribute to the teaching faculty. In line with the introduction of the new teaching program and as a part of the general reorganization at the hospital, Dr. Her-

man Smith, who has been the general superintendent of the hospital, now becomes the executive director and Dr. Samuel Soskin, head of the department of metabolism and endocrinology at Michael Reese for the past fourteen years, has been appointed medical director and dean of the new teaching and research faculty.

IOWA

Radio Program on Child Development—The seventeenth Iowa Conference on Child Development and Parent Education will be conducted by radio on June 15 in line with the national effort to reduce civilian travel. Today's Children Tomorrow will be the theme of the conference which is held annually under the auspices of the Iowa State Council for Child Study and Parent Education in cooperation with the Iowa Child Welfare Research Station, Iowa City, and the extension divisions of the State University of Iowa, Iowa City, Iowa State College of the Agriculture and Mechanic Arts, Ames, and State Teachers College, Cedar Falls. Among the speakers will be Robert R. Sears, Ph.D., Iowa City, on 'Shall We Neglect Our Children' and William F. Ogburn, Ph.D., Chicago, 'The Child in the Future.'

MAINE

State Medical Meeting—The house of delegates of the Maine Medical Association will meet at the Augusta House, Augusta, June 20. Dr. Oscar F. Larson, Machias, council chairman, will preside at the first session in the absence of Dr. Stephen A. Cobb, Sanford, president-elect now in military service. Dr. Carl H. Stevens, Belfast, president of the association, will preside at the luncheon meeting at which Andre William Reggio, surgeon (R), U.S. Public Health Service, regional medical officer, First Civilian Defense Region, Boston, will discuss Emergency Medical Service—Office of Civilian Defense. A second meeting of the house of delegates will conclude the one day session.

MASSACHUSETTS

Changes in Status of Licensure—At a meeting of the state board of registration in medicine, April 14, it was voted to restore the license to practice medicine in the Commonwealth of Dr. Daniel E. Vroman, Arlington. The board also voted to revoke the license of Dr. Solomon P. Bialow, Waltham, because of gross misconduct in the practice of his profession as shown by his conviction in court.

Tufts Building Fund Now \$500,000—A new gift of \$47,800 from Dr. and Mrs. George G. Averill, Waterville, Maine, brings the building fund at Tufts College Medical School, Boston, up to \$577,000. Dr. Averill graduated at Tufts in 1896. The recent gift brings his total contributions to the building fund up to \$100,000. During 1942, \$50,000 was raised for the building fund and \$54,000 was received from individuals, foundations and other sources for teaching, research and scholarships.

New State Health Commissioner—Dr. Vlado A. Getting, since 1942 commissioner of health of Worcester, has been appointed commissioner of public health of Massachusetts to succeed Dr. Paul J. Jakmauh, Boston. Dr. Getting graduated at Harvard Medical School, Boston, in 1935 and subsequently received the degrees of master of public health and doctor of public health from Harvard University. After internship at the Worcester City Hospital, he became associated with the state department of public health first as assistant epidemiologist, then as director of a mosquito survey and last as a district health officer. Dr. Getting was forced to resign from the medical corps reserve of the U.S. Army in 1942 because of a physical disability.

MICHIGAN

State Health Officer Reappointed—Dr. Henry Allen Moyer, Lansing, has been reappointed state health commissioner for a four year term beginning June 30.

First Nursery Schools Open—The Detroit Board of Education on May 7 opened sixteen nursery schools for children from 2 through 5 years of age, the first to be established with federal Lanham funds. Plans provide for the establishment of fifty such centers in Detroit.

State Increases Funds for Hospital Care—The state department of health announces that additional state funds will be available July 1 to aid Michigan counties in providing hospital care for persons who have tuberculosis. The legislature has provided \$2,900,000 to cover the state's share of the cost of hospital care for patients who are county charges during the next fiscal year or \$750,000 more than the current appropriation. A half million dollars is expected to cover the increase from \$1.50 to \$2 per patient day in the hospital in state pay-

ments to counties voted during the recent session. A separate \$250,000 item is for increased assistance to counties whose tax incomes are too small to cover their share of the cost of hospital care for their tuberculous charges.

Wayne County Health Department Created—On April 21 the board of supervisors of Wayne County established a Wayne County Department of Health. Members of the board of health include Drs. Lloyd K. Babcock, Detroit (three year term), and John W. Nagle Wyandotte (two year term). Other members of the board are Charles L. Brike, deputy superintendent of schools (five year term), George Bonk, clerk of Taylor Township (one year term) and Joseph H. McCann, post-graduate student in public health at the University of Michigan (four year term). The establishment of the department followed a health survey briefly supervised by the Wayne County Board of Auditors, of which Dr. Paul A. Klebba, Detroit, is medical adviser. In addition to the five member board which will direct the department there will be a director, a deputy health officer, one sanitarian, one supervising nurse, four nurses, one statistical clerk stenographer and one laboratory technician.

University Cooperates with Foundation on Infantile Paralysis Study—The National Foundation for Infantile Paralysis and the University of Michigan have joined in a long-range program for the training of doctors, public health workers and laboratory technicians to study infantile paralysis and other virus diseases. The program which has been developing for three years, will be expanded to its full scope by June 1 when the university opens its new three-story School of Public Health at Ann Arbor. The new structure will house a unit devoted entirely to work in virus diseases, particularly infantile paralysis. The virologists who will be trained under the program will be prepared to attack the whole realm of virus diseases including not only infantile paralysis but also influenza, atypical pneumonitis, St. Louis and equine encephalitis, measles, chickenpox, smallpox and mumps. To aid in the necessary planning and execution of the project the National Foundation has made a three-year grant, totaling \$120,000, to the university in addition to three previous grants, totaling \$110,000, made in the past three years. According to a release from the foundation, this is the first time in the history of the foundation that three long-term grants have been made within the space of a single year. Recently a five-year grant of \$150,000 was made to Yale University, New Haven, Conn., to establish the Yale Poliomyelitis Study Unit, and in 1942 \$500,000 was given to Johns Hopkins University, Baltimore, under a five-year grant to establish and conduct the Center for the Study of Infantile Paralysis and Related Virus Diseases.

MINNESOTA

Dr. Snyder Gives the Dight Institute Lecture—Lawrence H. Snyder, Sc.D., chairman of the department of zoology, Ohio State University, Columbus, delivered the second annual lecture under the Charles Fremont Dight Institute for the Promotion of Human Genetics on "Heredity and Modern Life," April 19. The institute was established in 1942 (TIM JOURNAL, June 13, 1942, p. 572) under the will of Dr. Charles Fremont Dight, who had been a member of the staff of the University of Minnesota Medical School, Minneapolis. The income of a fund of more than \$100,000 was bequeathed to the university to endow the institute, and studies were to be directed particularly to "a search for traits, such as metabolic disturbances, which may have genetic bases but are not recognized as hereditary traits."

MISSOURI

Virus Diagnostic Service—The laboratory section of the St. Louis Health Division has established a virus diagnostic unit for physicians wishing laboratory assistance in the diagnosis of virus diseases. At present the service is limited to the neurotropic virus diseases.

Personal—Dorothy A. Hehmann has resigned as executive director of the Missouri state cancer commission to become personal director of the New Haven Hospital, New Haven, Conn.—Dr. John I. Byrne, St. Joseph, has been appointed a member of the board of health, succeeding Dr. Leon Paul Forgrave, St. Joseph, resigned.

Annual Loeb Lecture—Col. Richard P. Strong, M.C., A.U.S., gave the eighth annual Leo Loeb Lecture at the Washington University School of Medicine, St. Louis, April 29. His subject was "The Importance of Tropical Diseases in Relation to the Present War." The lecture is sponsored by the Mu chapter of Phi Beta Pi in honor of Dr. Leo Loeb,

St. Louis, who in 1936, when the lectureship was established, was professor of pathology at the medical school. Dr. Loeb has been professor emeritus since 1937.

NEW JERSEY

New Medical Fund—Announcement has been made of a recently accumulated fund in the Newark Beth Israel Hospital Research Foundation in honor of the memory of Mrs. Dorothea Lichtman, wife of the president of the foundation, Abraham Lichtman. The foundation was formed in 1941 and is a corporation separate from the hospital organization but embracing what was then known as the institution's division of laboratories. It is supported by donations and by members of the hospital staff who carry on independent research.

NEW YORK

Aid for Adult Poliomyelitis Cases—*Health News* reports that an appropriation of \$20,000 has been made in the state budget for the coming fiscal year to provide state aid for such remedial care of adult poliomyelitis cases as may be authorized by local boards of health and health officers and approved by the state commissioner of health. Inquiries regarding procedures for making application for care under the provisions of this legislation should be directed to the district health officer.

Honorary Degrees Conferred—At its annual commencement, May 2, the University of Rochester, Rochester, conferred the honorary degree of doctor of science on Sister Elizabeth Kenny for her work in treating infantile paralysis. Similar degrees were conferred on Dr. Stanhope Bayne-Jones, professor of bacteriology at Yale University School of Medicine, New Haven, Conn., on leave as a colonel in the army medical corps, and Roger Adams, Ph.D., head of the chemistry department at the University of Illinois, Urbana, Ill., and one of the five chemists in charge of the nation's chemical warfare research.

Cancer Teaching Day—June 17 will be the occasion of the cancer teaching day at the Hotel Utica, Utica, under the auspices of the Medical Society of the County of Oneida, Utica Academy of Medicine, state medical society and its fifth district branch, and the state department of health. "The Management of the Patient with Advanced Cancer" will be discussed by Dr. Norman Treves, New York, and "Cancer of the Larynx, Bronchus and Esophagus" by Dr. Chevalier L. Jackson, Philadelphia. An evening meeting will be addressed by Drs. George E. Binkley and Lloyd F. Craver, New York, on "Cancer of the Colon and Rectum" and "The Significance of Enlarged Lymph Nodes" respectively.

Industrial X-Ray Laboratory—An industrial x-ray laboratory equipped with a million volt unit, a joint enterprise of the University of Rochester and eight industries, was formally opened on April 19. Ernest E. Charlton, Ph.D., of the General Electric Research Laboratories, Schenectady, who designed the apparatus, said in an address that the project represents "a novel and most useful cooperation in the joining of hands of university and industry in the developing of the full use of x-rays in the industrial field." The undertaking was financed by the Eastman Kodak Company, Rochester Products and Delco Appliance divisions of General Motors, the Pfandler Company, the Rochester Gas and Electric Corporation, Consolidated Machine Tool Corporation, Symington Gould Company and the Rochester Brewing Company. According to *Science*, the university supplies the scientific staff to make the tests and is free to use the equipment for research in metallurgy, medicine and engineering. Part of a second million volt unit is installed in another part of the laboratory for medical research on cancer. The remainder will not be available until after the war, it was stated.

New York City

Fraternity Sells \$600,000 in War Bonds—A luncheon celebration will be held at the Waldorf Astoria Hotel, June 2, at which treasury department officials will name two heavy bomber planes in honor of the Phi Delta Epsilon Medical Fraternity, which sold \$600,000 in war bonds during the last drive.

The Adam Miller Lecture—Dr. Carl J. Wiggers, professor and head of the department of physiology, Western Reserve University School of Medicine, Cleveland, recently delivered the Adam Miller Lecture at Long Island College of Medicine, Brooklyn, on "Recent Experimental Approaches to the Shock Problem."

Funds for Child Care—About \$20,000 in state funds has been allocated to finance the child care activities at twenty-eight New York City settlement houses. The twenty-eight centers have applied for regular participation in the state war

councils child care program. An emergency authorization has been granted for two months and a permanent arrangement will be made after the city's new fiscal year begins, July 1.

Funds for Nursery Care—The Board of Estimate voted on April 22 to provide city funds estimated at about \$120,000 a year, to aid in paying for day nursery care of children of working mothers. The board acted under state legislation stipulating that the state will pay one third of the cost, the city one third and the mothers one third. The state legislature had appropriated \$2,500,000 for state aid in connection with wartime child care projects.

First Prize in Cancer Exhibit—The Cure of Cancer is the Duty of Society" was the theme of the first prize winning exhibit in the competition conducted in the city's schools by the New York City Cancer Committee of the American Society for the Control of Cancer. Eight boys and girls students of the Forest Hills High School, formed the prize winning team for the exhibit which portrayed some of the significant contributions made by laboratory investigations on mice and rats.

Refresher Course in Venereal Diseases—A clinical refresher course in the modern diagnosis and management of venereal diseases opened, May 12, at the Central Clinic of the city department of health 150 Leonard Street, Manhattan under the auspices of the bureau of social hygiene. Dr. Louis Chargin, consultant to the bureau, will direct the course which will be held each Wednesday morning through June 30. The course offers practitioners the opportunity to observe laboratory and clinical diagnostic procedures and treatment methods for syphilis, gonorrhea, chancroid and other venereal diseases.

Physician Sentenced for Income Tax Evasion—According to the *New York Times*, Dr. Mandel Frankel was given a prison term of a year and a day, April 19 for evasion of income taxes amounting to more than \$36,000 for the years 1928 to 1938. The *Times* reported that the physician, said to be the operator of a large farm at Mount Bethel Pa., pleaded guilty to the charges last January. The newspaper further reported that Dr. Frankel was said by the government to have derived part of his income from an 'abortion mill' at 241 East 18th Street. He was allowed until April 29 to begin serving his sentence.

Dr. Bolduan to Retire June 1—Dr. Charles F. Bolduan, organizer and first director of the bureau of health education of the city department of health, will retire on June 1. At a dinner to mark his retirement, held on May 20, the speakers included Dr. James Alexander Miller, Edward H. Lewinsky-Corwin Ph.D., and Dr. Haven Emerson. Dr. Bolduan who reached the civil service age limit of 70 years on May 7, began his association with the department of health in 1904, when he was appointed bacteriologist. In 1907 he became assistant to the late Dr. Hermann A. Biggs, who was then general medical officer of the department. Six years later Dr. Bolduan established the bureau of health education. For the interim 1918-1928 he served with the U. S. Public Health Service. He formerly was professor of bacteriology at Fordham University School of Medicine (now extinct) and lecturer on preventive medicine and public health at Columbia University College of Physicians and Surgeons.

OHIO

Memorial to Dr. Crile—The *Cleveland Clinic Quarterly* has dedicated its April issue to the memory of the late Dr. George Crile, a founder and former president of the Cleveland Clinic Foundation. The *Quarterly* carries the addresses that were presented at the memorial service for Dr. Crile at Western Reserve University on January 24.

New Venereal Disease Control Officer—Roger E. Heering, passed assistant surgeon U. S. Public Health Service, has been lent to the state for service as venereal disease control officer. Dr. Heering came from district number 1, U. S. Public Health Service, with headquarters in New York where he had been venereal disease consultant for ten states included in the district. Dr. Heering had been lent to Ohio during the period 1939-1940 as venereal disease control officer in the Cincinnati area.

Retires as Secretary After Forty-Three Years—Dr. Oliver T. Sproull, West Union secretary of the Adams County Medical Society since 1900, declined reelection this year. Dr. Adams was a charter member of the society when it was organized in 1886. He has practiced in the county ever since he graduated at the College of Physicians and Surgeons, Baltimore, in 1886. His successor as secretary of the society is his daughter, Dr. Hazel L. Sproull, associated with him in practice at West Union.

PENNSYLVANIA

Personal—Dr. Thomas H. A. Stites has resigned as medical director of the Pennsylvania State Tuberculosis Sanatorium number 2 at Cresson, concluding twenty-nine years service to the state, sixteen of which have been spent at the Cresson Sanatorium. Dr. Stites plans to live at Nazareth.—Dr. Augustus H. Clagett, Upper Darby, has resigned as secretary of the Delaware County Medical Society to take up residence in Ocean City, N. J. He is retiring from active practice. Dr. Richmond C. Holcomb, Upper Darby, will act as secretary for the unexpired term.

Philadelphia

Department of Health Resumes Bulletin—The Philadelphia Department of Health has resumed publication of a bimonthly *Health Bulletin* which was discontinued in 1941 because of insufficient funds. This year Mayor Samuel approved a sum granted by the city council to publish again the bulletin and other health reports.

HAWAII

Medical Society Commended for Prewar Services—A senate resolution was adopted on April 26 in the legislature of the Territory of Hawaii 'proclaiming and recording the outstanding service by the Honolulu County Medical Society and the physicians and surgeons volunteering for service on Dec. 7, 1941 in the care of the wounded of the armed forces.' The resolution points out that the Honolulu County Medical Society had its prewar services so well organized that the members of the profession were able to perform swiftly and efficiently the extraordinary tasks they were called on to do in caring for the casualties among the members of our armed forces. In recognition of the outstanding service, the senate adopted the resolution.

Hospital for Paralysis Patients—The Office of Civilian Defense has erected a wooden building on the grounds of the Shriners Hospital for Crippled Children, Honolulu as emergency quarters for patients with poliomyelitis, following an outbreak which was first reported in February. Newspapers report that since February 34 cases have been placed under treatment. The outbreak is said to be confined to congested areas of Honolulu and is not an epidemic. Seven adults are included among the patients. Lieut. Gen. Delos C. Emmons, commanding the Hawaiian Department of the U. S. Army, has contributed \$5,000 to the emergency infantile paralysis hospital from the army's community chest fund. Brig. Gen. Edgar King, U. S. Army department surgeon, furnished the material and army nurses for the hospital, which is staffed by civilian physicians.

GENERAL

Theobald Smith Award to Be Continued—The original gift from Eli Lilly and Company to the American Association for the Advancement of Science for the Theobald Smith Award was for a period of five years. The grant expired this year with the award to Dr. Sidney C. Madden, New York (*THE JOURNAL*, May 1, p. 51). The interest in the award which consists of \$1,000 and a bronze medal, has been so great and the researches by young scientists for which it has been given have been of such a high order of merit that Eli Lilly and Company have notified the association of their intention to continue the award for at least three years.

Memorial to Dr. William P. Wherry—The establishment of a memorial to the late Dr. William P. Wherry, Omaha for many years secretary-treasurer of the American Academy of Ophthalmology and Otolaryngology has been authorized by the council of the academy. The memorial which is to be financed by the interest on \$16,000 to be raised by voluntary subscription and invested in war bonds is to be in the form of a paid-up membership in the academy to the person selected annually by the American Board of Otolaryngology as the most outstanding candidate examined. According to the *Transactions* of the academy, only one half of the objective has been subscribed.

Field Service to Aid Acceleration of Basic Nursing Education—To help schools of nursing plan acceleration of basic nursing education programs, the National Nursing Council for War Service has been granted a fund for field service by the W. K. Kellogg Foundation. The program of field consultation was to begin in April in the states requesting it and extend up to the time of the National League of Nursing Education's annual meeting in June. The director of the field service is Helen G. Schwarz, R.N., who is on a leave of

absence from her position as dean of the College of Nursing and Health of the University of Cincinnati and director of nursing in the Cincinnati General Hospital.

New Tuberculosis Research—A new tuberculosis research program has been initiated under the direction of Passed Assistant Surgeons Carroll E. Palmer and Herman I. Hilleboe of the U. S. Public Health Service with assistance from the National Tuberculosis Association. Student nurses in general hospitals will be the subjects for the study which aims to discover the constitutional factors that decide whether or not a person will be able to resist the tuberculosis germ invasion according to Factor X-ray. Student nurses were selected for the study because they are subjected to frequent contact with active cases of tuberculosis and can be examined at short intervals during their three year period of training.

Wartime Conference for Libraries Association—“Information for Victory” will be the theme underlying the several sessions of the 1943 Wartime Conference of the Special Libraries Association which will be held June 22-24 in New York at the Hotel Pennsylvania. Members of the Special Libraries Association, a national organization with eighteen chapters in the United States and two in Canada, are information specialists in advertising agencies, banks, chemical firms, engineering companies, insurance companies, government agencies, museums, newspapers, religious institutions, in short in virtually every field of knowledge. Miss Marguerite Burnett is chairman of the Wartime Conference Committee and librarian of the Federal Reserve Bank of New York.

Meeting of Genitourinary Surgeons—The twenty-ninth annual meeting of the American Association of Genito-Urinary Surgeons will be held at the Red Lion Inn, Stockbridge, Mass., June 10-12 under the presidency of Dr. Nathaniel P. Rutshim, Brooklyn. Among the speakers will be:

Dr. Vincent A. Balas, Philadelphia, Extraction of Ureteral Stones, Prevention of a New Infection.

Dr. Alexander R. Seavey and Victor E. Marshall, New York, Methods of Renal Transplantation, The Effect of the Bladder.

Dr. Ruben and Heinrich I. Weiden, Brooklyn, Cystophorectomy of the Bladder, Review of the Literature and Case Report.

Dr. Louis R. O'Connell and Russell H. Koch, Detroit, Recent Cases Illustrating Diseases of the Ureter and Salivary Glands.

Dr. Reel M. Nesbit and Edgar A. Webb, Ann Arbor, Michigan, Evidence in the Pathologic Concentration Test of Renal Function.

Dr. Hugh H. Yau, Baltimore, Surgical Treatment of Elephantiasis.

Dr. du Vigneaud Receives Mead Johnson Award—The \$1000 award given each year by Mead Johnson & Co. for researches on the B complex vitamins has been awarded this year to Vincent du Vigneaud, Ph.D., professor of biochemistry, Cornell University Medical College, New York, for his work on the structure of biotin. The recipient of the award is chosen by a committee of judges of the American Institute of Nutrition and the award ordinarily is announced at the institute's annual meeting. The meeting was canceled this year because of the war. Associated with Dr. du Vigneaud in the two year research leading to the elucidation of the chemical structure of the formula of biotin announced last year are the following: all of whom hold the degree of doctor of philosophy: Klaus Hofmann, Donald B. McVillie, Glen W. Kulmer, George B. Brown, A. W. Moyer, Julian R. Rachek, Marvin D. Armstrong, all of Cornell, and Hugh H. Darby of Columbia. Karl Folkers, Donald F. Wolf, Ralph Mozingo, John C. Keresztesy and Stanton A. Harris, all of the Research Laboratories of Merck & Co. Inc., Rahway, N. J.

Annual Meeting of Tuberculosis Physicians—The annual meeting of the American Academy of Tuberculosis Physicians will be held at the Palmer House, Chicago, June 9-10, under the presidency of Dr. Karl J. Henrichsen, Chicago. Among the speakers will be:

Dr. Jacob W. Cutler, Philadelphia, Advanced Tuberculosis and Pregnancy as Influenced by Collapse Therapy.

Dr. Charles F. Taylor, Norton, Kan., Emphysema—Treatment.

Dr. Maurice A. Pollock, Toronto, Bronchiectasis.

Dr. Harry J. Corper and Maurice I. Cohen, Ph.D., Denver, Specific Tuberculosis Immunity During Infection.

Dr. Arthur H. Beebe, Stillman, Valley, Ill., Tuberculosis Common Sense Angle—Forty Year View.

Dr. Laurie Lee Allen, Milwaukee, Nontuberculous Lesions of the Lungs.

Dr. David Salkin, Hopewell, W. Va., Treatment of Tuberculous Bronchitis.

Dr. Leroy Elrick, Denver, Coexistence of Pulmonary Tuberculosis and Mitral Stenosis. Report of Case with Autopsy Findings.

Dr. Giles Wolverton, Dayton, Ohio, Body Section Radiography Its Practical Value in Pulmonary Tuberculosis.

Dr. William F. Petersen, Chicago (subject not announced).

Lieut. Comdr. Oscar S. Levin, Denver, U. S. Navy, retired, Tuberculosis—the Science of Tuberculosis, The Medical Tubercologist—A Specialist in the Science of Tuberculosis.

Dr. Zoltan Galambos, Chicago, will address the luncheon session Wednesday on “The Tuberculosis Specialist in Undergraduate, Graduate and Postgraduate Medical Education.”

Government Services

Information Concerning Drugs That Should Be Sold Only To or On the Prescription of Physicians, Dentists or Veterinarians

The Food and Drug Administration has received numerous requests from drug manufacturers, retail and wholesale drug associations and others for a list of those drug products which it considers dangerous when sold otherwise than on the prescription of a physician, dentist or veterinarian licensed by law to administer drugs.

In answer to such requests, the administration has pointed out that the Food Drug and Cosmetic Act places on the manufacturer and the distributor the responsibility for properly safeguarding the marketing of drugs which may be dangerous to the purchaser if distributed without restriction. Obviously it is impossible to list all drugs which may be dangerous, since not only the compositions but also the directions for use and the conditions in which their use is recommended may have a very definite bearing on the question of safety or danger. As examples of drugs which are considered dangerous when distributed for use otherwise than on prescription, the following have been mentioned:

Aconite	Radium
Ammonium	Sulfanilamide
Barbiturates	Sulfapyridine
Benzedrine sulfate (for internal use)	Sulfathiazole
Cathartics (for internal use)	Tansy, tansy oil
Chrysanthemum or goa powder	Thiocyanates
Chrysanthemic acid	Thyroid
Cinchophen, neocinchophen and other cinchophen derivatives	The anthelmintic drugs
Colchicine	Carbon tetrachloride
Colchicum	Tetrachlorethylene
Emetine	Male fern (aspidium)
Phosphides	Santonin
Phosphorus	Wormseed oil (chenopodium oil)
	Thymol

It is the opinion that preparations containing bromides should not be sold without prescription if the dosage provided involves the consumption of more than 30 grams per day or more than 15 grams during any three hour period.

The same is true of acetanilid in the case of medicines that provide a total daily intake of more than 5 grams or more than 2½ grams during any three hour period.

For bromide-acetanilid combinations it has been suggested that preparations for lay use should not provide more than a total daily dose of 15 grams of sodium bromide and 5 grams of acetanilid or more than 7½ grams of sodium bromide and 2½ grams of acetanilid during any three hour period. Comparable amounts of other bromide preparations should, of course, be subjected to the same restrictions.

There is ample scientific evidence to support the view that preparations providing a daily dose of more than 15 grams of acetophenetidin or more than 15 grams of antipyrine are dangerous within the meaning of section 502(j) when distributed for indiscriminate lay use. Investigations which are currently in progress strongly suggest the probability that somewhat smaller daily doses of these drugs may likewise be dangerous when consumed indiscriminately. After public notice the regulatory program will, of course, include actions based on sales of acetophenetidin and antipyrine under circumstances providing for a somewhat smaller daily dose if scientific opinion becomes available to establish the illegality of such sales.

In the judgment of the Food and Drug Administration epinephrine in solution of 1 per cent or stronger cannot safely be indiscriminately used, and the same is true of ipecac in daily dosage greater than 10 grains as well as of strychnine in a daily dose greater than 1/20 grain.

It has also expressed the opinion that products containing therapeutically effective proportions of digitalis, squill, strophanthus or other pharmacologically related drugs may not be safe for indiscriminate distribution.

It has been found that manufacturers of such drugs as have been mentioned have taken advantage of the regulation permitting omission of directions for use and substitution of the so-called “prescription legend.” Where the legend “Caution: To be used only by or on the prescription of a Physician (Dentist or Veterinarian)” appears on the package in lieu of directions for use, it is the obligation of the retailer to observe the injunction that the article be dispensed only on prescription.

The fact that the federal law is applicable to the distribution by retailers of drugs which have been in interstate commerce in no way restricts the enforcement of state and local acts relating to the sale of drugs or the practice of pharmacy.

Foreign Letters

LONDON

(From Our Regular Correspondent)

April 17, 1943

The Proposed National Medical Service

The acceptance by the British Medical Association of the government's invitation to enter into a discussion with the Ministry of Health on a scheme for a comprehensive service for the prevention and cure of disease available to all members of the community, was reported in a previous letter. In these discussions representatives of other medical bodies than the British Medical Association such as the medical colleges, are taking part. Though no reports have been published the declarations of ministers at political meetings enable a forecast to be made. The government proposes that the national health service shall be administered through the local government machinery which already controls the public health service. This proposal has given rise to the first issue between the profession and the government for the *British Medical Journal* has in an editorial strongly objected to the proposal which would place the medical profession under the control of local lay bodies. The alternative is control by some medical body. On the other hand the proposal to create health centers for the treatment of disease where physicians could meet and assist one another and where apparatus would be provided is welcomed by the profession and was previously recommended by the Medical Planning Commission of the British Medical Association. These centers would be an extension to the whole community of group practice which already exists as a private enterprise. The free choice of doctor by patients which already exists under the panel system has also been announced and is approved in the profession. Thus the time honored British institution the family doctor would continue.

In the medical press it is suggested that the mode of payment of the service should be a basic salary for physicians plus a capitation fee. The present sale of practices will come to an end but compensation for the loss of the investment is demanded. Private practice is not to be forbidden but as the service is to provide all possible treatment general and special hospital and domiciliary free of charge for every person it seems that private practice must sooner or later disappear. Another question is the position of the voluntary hospitals which were founded and maintained by the money of the charitable for the treatment of the poor. They provide the highest medical and surgical skill including all kinds of specialism. It is in them that British medicine has been made and in which its leaders such as Bright Graves and Hutchinson, to mention only the greatest made their discoveries. The staffs of these hospitals gave their services free and lived on the consulting practice outside. This must largely or entirely disappear as consultants are to be supplied under the National Medical Service. They too must look to it for their livelihood. The charitable who have supported these hospitals in the past will no longer have any incentive to do so as the government becomes responsible for all hospital treatment. That is supposing the crushing taxation which is likely to continue after the war leaves any money for charity. It seems therefore that the voluntary hospitals will be absorbed into the state scheme.

The proposed state medicine for all is indeed a revolution and is much greater than that brought about by the panel system which applied only to a section of the population. Putting aside a small minority who have socialist views the scheme is not wanted by the medical profession and is being imposed on it by the government. But opposition to it is voiced by only a few

as it is recognized that the government has the right as well as the power to decide the best system for the promotion of the national health. What physicians can insist on and are insisting on is consultation with them as to details. How the plan arose as part of the Beveridge report on a wide scheme of social reform was shown in a letter in *THE JOURNAL*, January 9, page 142. It has to be remembered that the plan emanates from a coalition government of all the political parties and is approved by them all. The only political difference is that the labor party has assumed the attitude of being more strenuous than the government and attacked it for want of energy. Thus the medical profession could not rely on the support of any political party if it opposed the scheme.

At a special representative meeting of the British Medical Association the government's invitation to enter into discussions without commitment was agreed to without dissent. A resolution that the section of the population with income above a certain level should continue to obtain domiciliary medical service on a private basis was referred to the council of the association. It was agreed that every practicable step be taken to give all members of the profession, whether members of the association or not an opportunity to express their views particularly the members of the profession now on war service.

The Official Medical History of the War

A committee of the war cabinet has been set up to control official histories of the war of which medical history including the civilian as well as the fighting services is to be included. Sir Arthur MacNalty formerly principal medical officer of the Ministry of Health is the editor in chief. The director generals of the fighting services will act as editors in respect to their departments. There is a board to supervise the collection of material prevent overlapping and select contributors. It has power to choose experts on special subjects and consult with investigation committees set up by other bodies notably the Medical Research Council. Close touch is maintained with various bodies and persons whose work has any bearing on matters of interest for the history. Government departments are cooperating by furnishing reports and official documents relating to medical administration and to technical and clinical subjects. The dominions and colonies and the Allied governments are collaborating. Close liaison has been established with the National Research Council in the United States which is collecting similar data and there is an exchange of experience and information. Attention is also being paid to medical literature already published.

Sir Arthur MacNalty has described to the Section of Medicine of the Royal Society of Medicine the scope of treatment of the various medicosociological problems relating to civil life which have arisen during the war. Each of the fighting services will contribute its own section describing its medical organization before the war its growth and increased functions during the war and the medical aspects of the various campaigns. Certain problems will be treated at length in those sections of the history likely to be published first so that wartime experience may be available as widely as possible. Contributors are being asked to submit progress reports because few monographs can be written until the war is over. Records should be made while the memory is fresh and changes in methods recorded when they take place. MacNalty indicated some of the headings in the technical volumes war nutrition physical training of recruits effects of shipwreck immersion and exposure blood transfusion effects of high explosive bombs blast and crush injuries burns plastic surgery epidemiology, venereal diseases psychiatric conditions industrial health and rehabilitation. A special volume will be devoted to statistics. He invited the help of the medical profession, on whose cooperation the success of the history would largely depend.

"Deck Ankles"

Under the designation "deck ankles" has been described in the *Journal of the Royal Army Medical Corps* a condition observed on troop ships. On about the tenth day of the voyage some men complain of sick pride or edema of the ankles for which there is no apparent cause. They represent about 15 per cent of the total strength on board. It was found that a similar condition had been noted on a previous trip. The swelling appeared insidiously and had no relation to injury. One or both ankles were affected. Some men complained of slight itching and stiffness of the ankles with discomfort and a tired feeling in the feet, especially at the end of the day. In about half the cases the swelling extended on to the dorsum of the foot. It always began at a level just above the edge of the uppers of the gymnasium shoes which had been worn since embarkment. In some cases the swelling reached as far as 4 inches above the tips of the malleoli, filling the hollows on each side of the Achilles tendon.

No discoloration was noticed at first, but in erythematous flush with fine ecchymoses soon appeared. Active movements were slightly restricted and without pain, passive movements free but slightly painful on full inversion or eversion of the foot. The tissues were mildly inflamed and the skin somewhat hot. No evidence of heart or kidney disease was found, and dietary deficiency was scarcely possible. Rest in bed was thought the most suitable treatment but was impracticable. Some were told to wear boots, and their average number of days on treatment was five, for those who continued to wear gymnasium shoes, twelve days. After the fourteenth day of the voyage the number of cases reporting declined and none reported at the end of the ensuing week. It is suggested that slight trauma, the result of walking on hard decks and repeated small twists of the ankle when ascending and descending hatchways, while wearing gymnasium shoes, produced the disability, that varicose veins, sun erythema and lack of "seasoning" among the troops were aggravating factors and that the wearing of boots, restoring the accustomed support to the ankles, constitutes a specific cure.

The Vector of Indian Kala-Azar Discovered

It has been proved that the sandfly *Phlebotomus argentipes* is the vector of Indian kala-azar. The discovery is the result of over twenty years' strenuous work in India by a number of investigators. It was early observed that the fly occurs wherever the disease is endemic. It was shown that if the fly is fed on parasite-containing blood of kala-azar patients the disease flagellate forms of *Leishmania donovani* develop in the foregut and midgut of some of the flies. It was then found that only isolated susceptible animals could be infected by the bites of infected flies, and experiments on human volunteers failed. An impasse seemed to have been reached. How this has been overcome is shown by a paper published in the *Indian Journal of Medical Research* (30:473 [July] 1942) by Swaminathi, Shortt and Anderson. All five human volunteers were infected by the bites of experimentally infected flies, thus proving that the insect can transmit the disease from man to man. The reason why these experiments were successful appears to be that the flies were sustained during the two weeks development of the parasite in them on fruit juices instead of on blood, as in the previous experiments.

New Type of Air Ambulance for United States Troops in Britain

The United States Eighth Army Air Force has in this country a new type of emergency ambulance aircraft. The machines can be used to accommodate 18 stretcher cases and medical staff or as troop carriers or for carrying freight. The idea is that during the outward journey this big new type should carry troops or equipment, bringing back wounded on

the return journey. Air ambulances in Russia and North Africa have saved the lives of many wounded and of sick who would not have survived long and tiring journeys to base hospitals in road ambulances. Aircraft ambulances have also the advantages that they obviate the need for maintaining large stocks of medical supplies in forward positions and that they increase the efficiency of fighting units by relieving them of their responsibility for men put out of action by wounds or illness.

American Surgeon Joins the Editorial Board of the British Journal of Surgery

Col. Elcott C. Cutler, professor of surgery at Harvard Medical School and now chief consultant in surgery to the United States forces in Britain, has accepted a seat on the editorial committee of the *British Journal of Surgery*. In announcing this the *Journal* states that his election is a symbol of the comradeship and brotherhood which unites our countries in the mighty struggle we are waging for the freedom of the world. This step is in accord with the feelings of the late Lord Moyne, who presided over the policy of the *Journal* for twenty-one years and did incomparable service in bringing together American and British surgeons.

Pulmonary Elasticity

Drs. M. R. Castex, E. S. Mazzei and G. Caputo of the Instituto de Investigaciones Aplicadas a la Patología Humana of the Academia Nacional de Medicina of Buenos Aires recently completed certain research work previously carried on with the aim of determining the elasticity of the lung, either normal or in the course of diseases of the respiratory tract. They established the physical conception of elasticity of the structure as the property of the pulmonary tissues to be distended by air and the regaining of their previous form when air is eliminated. The degree of pulmonary elasticity can be determined by (1) the force of distention and (2) the degree of distention which the force provokes. From an analysis of the various methods which have been tried up to now for the determination of the degree of pulmonary elasticity it appears that the Christie and McIntosh method is the most simple, exact and reliable. The standard measures of this method are (1) the intrapleural pressure, which indicates the force of distensibility of the lung, and (2) the volume of current air, which indicates the degree of distention produced. The authors' method is based on two factors. The first factor, the so-called unity of pulmonary distensibility, is the result of the differential figures of the greatest change of pleural pressure between inspiration and expiration, which is measured in centimeters of water. The resulting figure is divided by the volume of current air, which is expressed in hundreds of cubic centimeters. The second factor, which is called the coefficient of pulmonary distensibility, is independent of the size and height of the individual. This factor is the result of the change of intrapleural pressure in a regular respiration. The values obtained by the authors' method are in agreement with those obtained by Christie and McIntosh. The latter established figures between 3 and 4 and 7 and 8 as normal values for the coefficient of pulmonary distensibility and between 0.79 and 1.56 for the unity of pulmonary distention. The authors conclude that the technique of their procedure is simple and the method reliable. It is of value both for the roentgenologist and for the clinician, especially for the diagnosis of borderline cases with signs of fibrosis and accentuated bronchial changes. In anatomic emphysema the figures of the method are always abnormal, whereas the values are normal in cases of functional emphysema, which is frequent in patients with asthma.

Argentine League of Mental Hygiene

The Argentine League of Mental Hygiene was established in 1929. It supports several institutions, especially the Neuropsychiatric Institute, of which Dr. Lirranco Ciampi is the head. The institute has several departments for instruction in the teaching of elementary school as well as of manual and professional work, physical education and orthophonics. The league has two consulting offices for ambulant patients. The number of patients admitted for consultation in the offices increased from 10,000 in 1940 to 13,363 in 1941. The Department of Social Science works in collaboration with the league. The latter has also a school for visiting and social nurses of mental hygiene which has been functioning for the last ten years. It has also an office for juridical consultations. The *Revista Argentina de Higiene Mental* recently established by the league, will appear quarterly.

Antituberculous Vaccination in Bolivia

A laboratory for the preparation of BCG vaccine was recently established in Sucre, Bolivia, following initiatives of some members of the university of the city. The government of Bolivia recently created a department of antituberculosis vaccination in La Paz. This department depends on the national board for the antituberculosis crusade of the Ministry of Public Health. It is formed by two sections for the preparation and administration of the BCG vaccines respectively. Vaccination should be administered only in certain well organized territories. It will be given under strict conditions of scientific control.

Bubonic Plague in Palestine

Since 1922, when bubonic plague appeared as a mild epidemic in Jaffa and in Tel Aviv, Palestine has been free from this disease. In 1922 there were nearly 150 cases of which about a third proved fatal. The epidemic was quickly brought under control. A dramatic description of the struggle against this epidemic is to be found in Victor Heiser's "An American Doctor's Odyssey." In May 1941 plague infected rats appeared and in July of the same year the first human case of bubonic plague was reported in Haifa. The report of the Department of Health of the Government of Palestine contains the following interesting details. The trapping and laboratory examination of rats has become a routine procedure in the ports of Palestine since 1920. The value of the measure was shown this year, when, during the first week of May, plague infection was demonstrated in a rodent taken in the port of Haifa. Evidence of increased rat mortality was quickly forthcoming and by the end of the month 11 more infected animals had been collected. Energetic measures were adopted. The harbor is of recent construction and during the building close attention was paid to rat proofing. Conditions were thus favorable for rat destruction, although this was offset at first by the large quantities of grain which were in storage in the sheds. By the end of June no further infected rats were being taken. When an epizootic is established it is unusual for human beings to escape and on July 13, in a quarter known as the Eastern Gate which lies close to the harbor the first human case occurred. Infected rats were found on the premises and from then onward spread of infection in both the rodent and the human population was maintained. There were 9 further human cases during the year.

Rat trapping was undertaken over a wide area. In eight months 5,000 rats were trapped, killed or found dead. 66 were infected. Where the harborages of rats permitted or demolition or removal this was done. Some 4,000 wood and tin shacks were dealt with in this manner. Accumulations of building debris and other rubbish were removed. Rat proofing was undertaken. Houses, shops, cellars, yards, walls and sewers

were treated. It is estimated that the equivalent of 800,000 square meters of surface were rendered rat proof. The cost of these operations was £P 7,000. The operations are being maintained and where necessary extended.

The initial demolitions resulted in the eviction of some 400 families, and this number has since been augmented. Temporary accommodation for a proportion of the families had to be provided. The housing problems do not stop here. Arrangements have been initiated to provide financial assistance for those people, and later perhaps for others living in the slums, who are prepared to replace their shacks by stone built houses. Government credits to the extent of £P 10,000 have been sanctioned for the purpose.

Existing economic conditions in Haifa present a barrier to the success of the campaign against plague. The soaring rents of recent years have driven people into the slums where conditions ideal for the rat, are fraught with danger for man.

The methods of rat destruction employed were confined to trapping or killing with batons. Poisoning with bait, smoke and other methods have not yet been adopted. Inoculation with plague vaccine was confined to contacts.

Sulapyridine therapy was employed early, in doses of 4 Gm in twenty-four hours for an adult without fatality.

The progress of the disease in each case was swift, and when death occurred it was usually after the first four days. In the fatal cases septicaemia set in. In 1 case in which the disease developed exceptionally fast, bacilli were actually found in the sputum. Postmortem examination however, did not reveal pneumonia. It is probable that some cases were not diagnosed in time. Recently for example, an unidentified Arab, who had been trampled on by a horse, was discovered on a road having died from unknown causes. The autopsy revealed plague bacilli. A diphtheria patient, with characteristic diphtheria membrane in the throat and diphtheria bacilli in the throat was found to have swollen throat glands. After his death plague bacilli were found in the glands.

One patient was brought to the government hospital with a large open sore on his leg and swollen glands. Under normal circumstances it would not have occurred to the physician to examine the contents of the glands. But his glands were found to contain plague bacilli, plague bacilli were also found in the open sore on his leg.

Large quantities of vaccine are being prepared in the government laboratory and in the university laboratory for the coming spring. Except to a few doctors plague is an unknown disease to practitioners in this country. In this connection they have been greatly assisted by helpful advice and lectures given by English and Indian military physicians.

Marriages

WILLIAM YASUHI TAKAHASHI, Seattle, to Miss Mary Howard Constable of New York at Ann Arbor Mich., May 2

HOWARD VINCENT VALENTINE to Miss Lucille Maureen Decker both of Spokane, Wash in Webster Mass May 1

JOHN JOSEPH CREEDON Flushing N Y to Miss Grace Constance Arbogast of White Plains in New York May 1

ALFRED J NIEDERMAYER Evansville Ind. to Miss Violette Capello of Elizabeth N J, February 28

ROBERT LEE ATKINSON Bloomington Ill to Miss Martha Jane Prindle of Evanston in March

ODEN A SCHAEFFER Coral Gables Fla to Miss Catherine Louise Smith of Miami April 11

ERNEST ROWAN Bogalusa, La to Miss Reba Pylant of Petersburg Tenn April 2

JOHN G RUSSO Madison Wis to Miss Pia Camponeschi of Kenosha March 6

KENNETH H SCHNEPP to Miss Lois Catron both of Springfield Ill March 31

Deaths

Samuel Griffith Davis Jr. † Baltimore, University of Maryland School of Medicine, Baltimore, 1893, specialist certified by the American Board of Anesthesiology, Inc., member of the American Society of Anesthetists, Inc. and the Association of Military Surgeons of the United States, fellow of the American College of Surgeons, professor of anesthesia at his alma mater, at one time professor of anatomy and operative surgery at the Woman's Medical College of Baltimore, served in the Tenth Regiment of the Maryland National Guard for twenty-six years, is a captain and assistant surgeon in the Spanish-American War and is a major and chief surgeon on the Mexican border, anesthetist to the University, Mercy, Union Memorial, Bon Secours and the South Baltimore General hospitals and the Church Home and Infirmary, consulting anesthetist to St. Joseph's West Baltimore General and the Sunn hospitals, on the staff of the Hospital for Women, a life-size portrait of "The Three Musketeers" of medicine—Drs. Davis, Guy L. Hammer and Thomas S. Cullen—was presented to the Church Home and Infirmary in 1912 as a gift of the graduate nurses of the institution, aged 75, died April 21, of heart disease.

Taleasin H. Davies, Wilmington, Del., University of the South Medical Department, Sewanee, Tenn., 1898, member of the Medical Society of Delaware, a member of the Delaware Commission for Mentally Defective, past president and secretary of the New Castle County Medical Society, for many years a member of the state board of medical examiners, at one time professor of neurology at the Temple University School of Medicine, Philadelphia, formerly superintendent of the Ferris Industrial School, for many years president of the board of health of Wilmington, recently served on the advisory board of the draft board and in the same capacity during World War I, consultant and formerly assistant superintendent of the Delaware State Hospital, Fairmount, consulting neurologist to the Wilmington General Hospital, chief of the staff of psychiatry and neurology of the Delaware Hospital where he died, March 25, of lobar pneumonia and cerebral hemorrhage, aged 67.

Hugh Atlee Beam † Moline, Ill., Northwestern University Medical School, Chicago, 1903, member of the American College of Chest Physicians and at one time president of the Illinois chapter, fellow of the American College of Physicians, for two years president of the Upper Rock Island County Tuberculosis Association, past president of the Rock Island County Medical Society, served as a captain in the medical corps of the U. S. Army during World War I and as a medical examiner for the draft board for rural Rock Island County, again appointed to the latter position in 1940, member and formerly president of the staffs of the Lutheran and Moline Public hospitals, for many years a medical director of the Rock Island County Tuberculosis Sanatorium, Rock Island, aged 60, died, March 31, in St. Luke's Hospital, St. Louis.

Marion Craig Potter, Rochester, N. Y., University of Michigan Department of Medicine and Surgery, Ann Arbor, 1884, member of the Medical Society of the State of New York, past president of the Women's Medical Society of New York State, one of the members of the committee of medical women of the Council of National Defense during World War I, in 1928 was awarded the Santa Sava medal by the Serbian government for assistance in founding the American Women's Hospital at Monastir, on the staff of the Monroe County Hospital, a delegate to the White House Conference for Child Care and Protection, formerly on the editorial board of the *Medical Woman's Journal*, aged 79, died, March 23, of paralysis agitans.

Walter Elmo Kelton, Seattle, University of Pennsylvania Department of Medicine, Philadelphia, 1905, member of the Washington State Medical Association, served in the medical corps of the U. S. Army during World War I, on the staff of the King County Hospital, in 1935 appointed surgeon to federal prisoners, formerly vice president of the King County Medical Society, surgical consultant, department of labor and industries, for the state of Washington, consultant for the Northern Pacific Railway, aged 65, died, March 9, of coronary thrombosis.

Percy Crump Anders † Plainview, Texas, Birmingham (Ala.) Medical College, 1914, served during World War I, aged 59, died, March 26, of coronary thrombosis.

David F. Banker † Canton, Ohio, Western Reserve University Medical Department, Cleveland, 1900, on the staff of the Mercy Hospital, aged 74, died, March 5, of cardiac decompensation and arteriosclerosis.

Elmer E. Bechtell, Dayton, Ohio, Eclectic Medical Institute, Cincinnati, 1897, member of the Ohio State Medical Association, aged 75, died, March 31.

John Musser Beck, Alexandria, Pa., Medico Chirurgical College of Philadelphia, 1901, member of the Medical Society of the State of Pennsylvania, past president and secretary of the Huntingdon County Medical Society, for many years school director of Alexandria and medical inspector of schools of Huntingdon County, a trustee and president of the board of the Memorial Public Library, aged 70, died, March 16, of cardiovascular disease.

James Birkhead, Schenectady, N. Y., Columbia University College of Physicians and Surgeons, New York, 1899, member of the Medical Society of the State of New York, on the staff of the Ellis Hospital, aged 69, died, March 16, in St. Luke's Hospital, New York, of pneumonia and carcinoma.

William Black † Mankato, Minn., University of Minnesota College of Medicine and Surgery, Minneapolis, 1909, at one time chief of staff of the Immanuel Hospital, aged 64, died, February 12, of hypoplastic anemia.

Max Emanuel Bloch † Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900, aged 69, died, March 14, in the Illinois Masonic Hospital.

Hughling Ellsworth Bowerman, Leaf River, Ill., Bennett College of Eclectic Medicine and Surgery, Chicago, 1897, member of the Illinois State Medical Society, served as mayor and is a member of the Ogle County Board of Supervisors, aged 68, died, March 2, in St. Francis Hospital, Freeport, of carcinoma.

Thomas Edward Bowman, Harrisburg, Pa., Jefferson Medical College of Philadelphia, 1902, member of the Medical Society of the State of Pennsylvania, president of the city Civil Service Board, aged 64, on the staff of the Harrisburg Polyclinic, where he died, March 4, of cerebral thrombosis.

Jacob Bressler † New York, University and Bellevue Hospital Medical College, New York, 1912, on the staff of the Gouverneur Hospital, aged 53, died, March 10, of heart disease.

Charles H. Burgin, Delta, Colo., American Medical College, St. Louis, 1898, member of the Colorado State Medical Society, city health officer of Delta, formerly member of the board of education, aged 81, died, March 8, of coronary disease.

Dell Duncan Butler † Mount Lebanon, Pa., University of Pittsburgh School of Medicine, 1918, for many years on the staff of the Western Pennsylvania Hospital, Pittsburgh, aged 48, died, March 3, of coronary thrombosis while shoveling snow.

Vincent P. Capodici, Brooklyn, Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1905, aged 62, died, March 3, of cerebral hemorrhage.

James Oliver Carson † Bowling Green, Ky., University of Louisville Medical Department, 1878, formerly quarantine officer for the Kentucky State Board of Health, served as United States Pension Examiner, member of the board for medical examinations of physicians for the medical corps in the U. S. Army during World War I, fellow of the American College of Surgeons, on the staff of the City Hospital, past president and honorary member of the Rotary Club, aged 87, died, March 15, of heart disease.

Samuel Hopkins Cassidy, Keyport, N. J., University of Maryland School of Medicine, Baltimore, 1911, president of the board of health of Keyport, aged 63, on the staff of the Royal Pines Hospital, Pinewald, and the Dr. E. C. Hazard Hospital, Long Branch, where he died, March 14, of chronic nephritis and uremia.

Andrew Clark, Billings, Mont., Detroit College of Medicine, 1893, member of the Medical Association of Montana, aged 78, served on the staffs of the Billings Deaconess Hospital and St. Vincent Hospital, where he died, March 7, of myocardial insufficiency.

Nannie Clayton Clark, San Marino, Calif., Hahnemann Medical College and Hospital, Chicago, 1889, aged 82, died, March 16, of carcinoma of the stomach.

Jeremiah Joseph Cohane, New Haven, Conn., Yale University School of Medicine, New Haven, 1898, member of the Connecticut State Medical Society, aged 67, on the staff of the Hospital of St. Raphael, where he died, March 9, of a fracture of the right hip and brain injury received in a fall on the ice.

Brice X. Corbin, Tacoma, Wash., Washington University School of Medicine, St. Louis, 1898, aged 72, died, March 1, of chronic myocarditis.

Katherine Louise Crawford, Ann Arbor, Mich., University of Michigan Department of Medicine and Surgery Ann Arbor, 1898, aged 84 died March 16 in Detroit of hypertensive heart disease.

Albert Manning Cross, Charleston W. Va. (licensed in West Virginia in 1929) served during World War I formerly on the staffs of the Weston (W. Va.) State Hospital and the Spencer (W. Va.) State Hospital aged 65, died February 21 in Hopewell of pulmonary tuberculosis.

Stirley Casper Davis & Tucson Ariz. Hospital College of Medicine Louisville Ky. 1906, member of the American College of Chest Physicians fellow of the American College of Physicians past president of the Pima County Medical Society, one of the founders and chief of the medical staff of the Thomas-Davis Clinic clinical director of the Southern Pacific Sanatorium served during World War I had been president of the school board and of the chamber of commerce aged 60 died March 14 of heart disease.

Charles M. Doty, Effingham Ill., St. Louis College of Physicians and Surgeons 1897 member of the Illinois State Medical Society, past president of the Effingham County Medical Society served as county coroner aged 72 formerly on the staff of St. Anthony's Hospital where he died March 5.

Wilmer Ingalls Gordon, Cleveland Albany (N. Y.) Medical College 1887 aged 83 died March 7 of decompensated heart disease.

Dayton T. Gould, Lodi Ohio, Western Reserve University Medical Department Cleveland, 1870 also a pharmacist chairman of the board of directors of the Berea Commercial and Savings Bank aged 96, died, March 9 of mitral regurgitation.

Charles Sumner Gracey, Cumberland Md. Maryland Medical College Baltimore 1912 aged 66 died March 2 in Everett Pa.

William Graf, Perrysville Ohio Medical College of Ohio Cincinnati 1900 aged 74, died March 2, in the Mansfield (Ohio) General Hospital of thrombosis.

Jesse Trott Grayston & Cedar Rapids Iowa University of Illinois College of Medicine Chicago 1913 fellow of the American College of Surgeons served during World War I on the staffs of the Mercy and St. Luke's hospitals aged 53 died March 7 of coronary occlusion.

Francis Freeman Grillet, Alanson Mich. Saginaw (Mich.) Valley Medical College, 1900 aged 74 died March 12 of myocardial insufficiency.

Emil Gunther, Sheboygan Wis. Rush Medical College Chicago 1892 for a short time served as city physician aged 75 died March 8 in St. Nicholas Hospital of cerebral sclerosis frozen feet and gangrene.

Ernest Hubbard Hamilton, Longview Texas University of Nashville (Tenn.) Medical Department 1900 member of the State Medical Association of Texas served overseas as a captain in the medical corps of the U. S. Army during World War I, was awarded decorations for bravery at one time surgeon in the U. S. Public Health Service Reserve formerly city health officer chief surgeon for the C. F. Lytle Construction Company Denison aged 67 died March 14 in Denison of bronchopneumonia.

Waldo Russell Harkness & Montpelier Vt. University of Vermont College of Medicine Burlington 1898 president of the staff of the Heaton Hospital aged 69 died March 14 of myocarditis.

Henry Reed Hatfield, Philadelphia Jefferson Medical College of Philadelphia 1881 formerly a lawyer at one time a judge advocate general of the First Brigade Pennsylvania National Guard with the rank of major aged 86 died March 11 of uremia.

Octavius J. Henderson, Montgomery W. Va. Medical College of Virginia Richmond 1889 member of the West Virginia State Medical Association past director of the Montgomery National Bank, aged 79 died March 13 of pneumonia.

James McPherson Howe, Hillsboro, Iowa State University of Iowa College of Medicine Iowa City, 1897 member of the Iowa State Medical Society aged 73 died March 11 of myocarditis.

Winfred Harold Iliff, Baxter Springs, Kan., University of Kansas School of Medicine, Kansas City, 1907, member of the Kansas Medical Society, secretary and past president of the Cherokee County Medical Society, served in the medical corps of the U. S. Army during World War I aged 59, died March 2, in St. John's Hospital, Joplin, of pneumonia.

William Henry James, Pennsville N. J., University of Vermont College of Medicine Burlington, 1885 member of the board of health aged 82 died, March 5 in Philadelphia of arteriosclerosis.

Adolph Samuel Katzman, West Hempstead N. Y. University and Bellevue Hospital Medical College New York, 1902 at one time a druggist served during World War I, aged 67 died March 12 of coronary thrombosis.

Claude J. Koopce, Halltown W. Va. Georgetown University School of Medicine, Washington D. C. 1896 aged 72 died March 12 in the Washington County Hospital Hagerstown Md., of lobar pneumonia and agranulocytosis.

Stephen S. Krajewski, Nanticoke Pa., Medico-Chirurgical College of Philadelphia, 1911 formerly on the staffs of St. Joseph's and Mercy hospitals Denver on the staffs of the Nanticoke State Hospital and St. Stanislaus Orphanage, aged 62 died March 31 of pneumonia.

Alfred I. Lowenthal, New York University of Pennsylvania School of Medicine Philadelphia 1912 served during World War I on the staff of the Hospital for Joint Diseases aged 54 died, March 11 at his home in Leona N. J. of cerebral hemorrhage and hypertensive cardiovascular disease.

John Edward Loyd, Natural Bridge Station Va. University of Virginia Department of Medicine Charlottesville 1901 member of the Medical Society of Virginia aged 67 on the staff of the Stonewall Jackson Memorial Hospital Lexington where he died March 5 of bronchiectasis.

Louis Emanuel Martin, Savannah, Ga. Meharry Medical College Nashville Tenn. 1909 on the staff of the Charity Hospital aged 68 died March 13 of right hemiplegia and nephritis.

Ernest B. McAndrew & Corning N. Y. University of Buffalo School of Medicine 1920 on the staff of the Corning Hospital aged 47 died March 15 of coronary thrombosis.

Elam Rowland McBroom, New Canton Ill. Chicago College of Medicine and Surgery 1908 also a Methodist minister veteran of the Spanish-American War aged 66 died March 18 of angina pectoris.

John Joseph Meany & Major M. C. U. S. Army Bloomington Ill., St. Louis University School of Medicine 1939 served an internship at the St. Louis City Hospital appointed a first lieutenant in the medical corps of the U. S. Army Feb. 6 1942 later became a captain major and flight surgeon with the third air defense wing aged 27 was killed in action in North Africa March 20.

Thomas Peacock Miller, Knoxville Tenn. Lincoln Memorial University Medical Department Knoxville 1910 served as a captain in the medical corps of the U. S. Army during World War I aged 65 died March 11 of pneumonia and multiple sclerosis.

Jackson M. Mills, New York University of Nashville (Tenn.) Medical Department 1884 Vanderbilt University School of Medicine Nashville Tenn. 1884 member of the Medical Society of the State of New York aged 78 died March 17 in the New York Hospital of benign hypertrophy of the prostate and bronchopneumonia following transurethral section.

Sydney G. Montell, Jonesboro Ark. (licensed in Arkansas in 1903) aged 73 died March 8 of cerebral hemorrhage.

Hassie Albert Moore, Lakeland Fla. University of Louisville (Ky.) Medical Department 1892 aged 83 died March 19.

William Lawrence Nunan, Philadelphia Jefferson Medical College of Philadelphia 1894 on the courtesy staff of the Hahnemann Hospital aged 73 died March 23 in St. Luke's and Children's Medical Center of renal calculi, renal infarct and heart disease.

KILLED IN ACTION

MAJ. JOHN JOSEPH MEANY, M. C.,
U. S. ARMY, 1915-1943

William George Priester † Houston, Texas, Louisville (Ky) Medical College, 1904, fellow of the American College of Surgeons, on the staff of the Memorial Hospital, aged 61, died, March 20, of acute cardiac dilatation.

Howard Reed, Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1891, member of the Medical Society of the State of Pennsylvania, served during World War I also a pharmacist at one time on the staffs of the University of Pennsylvania and Temple University hospitals, aged 77, died, March 13, in the U. S. Naval Hospital of carcinoma of the lower part of the intestine.

William Marvin Reser, La Fayette, Ind., Jefferson Medical College of Philadelphia, 1903, member of the Indiana State Medical Association, past president and secretary of the Tippecanoe County Medical Society, charter member and past president of the Tippecanoe County Historical Society, on the staff of La Fayette Home Hospital, for twenty-five years examining physician for the Prudential Life Insurance Company, aged 79, died, March 19, of pulmonary tuberculosis.

Robert Barnwell Rhett † Charleston, S. C., Medical College of the State of South Carolina, Charleston, 1914, served in the medical corps of the British Army during World War I, major in the medical reserve corps of the U. S. Army, not on active duty, associate in ophthalmology, rhinology and otolaryngology at his alma mater, on the staff of the Roper Hospital, aged 52, died, March 25, of myocarditis and angina pectoris at his summer home near Hendersonville, N. C.

John Frederick Rickenbach, Pittsburgh, Bellevue Hospital Medical College, New York, 1875, aged 91, died, March 9, in the German Protestant Home for Aged, of heart disease.

Edgar Rood, Westfield, N. Y., University of Buffalo School of Medicine, 1878, aged 89, died, March 7, in Buffalo of angina pectoris.

Hugh Madison Ross, Chester, S. C., Medical College of the State of South Carolina, Charleston, 1911, served during World War I, aged 56, died, March 14, in the Pryor Hospital of ruptured diverticulitis.

Belle Bennett Sharpe, Pasadena, Calif., Hahnemann Medical College and Hospital, Chicago, 1905, aged 74, died, March 14, of cerebral hemorrhage and arteriosclerosis.

Charles Wade Simison, Hawley, Minn., University of Missouri School of Medicine, Columbia, 1907, member of the Minnesota State Medical Association, in 1938 elected vice president of the Northern Minnesota Medical Association, member of the sanitarium commission in Clay and Becker counties, aged 64, on the staff of St. Ansgars Hospital, Moorhead, where he died, March 6, of cerebral hemorrhage.

Clarence Elmer Smith † Missillon, Ohio, Ohio Medical University, Columbus, 1902, member of the city board of health, aged 67, on the staff of the Massillon City Hospital, where he died, March 9, of cerebral hemorrhage.

Edward Cooper Smith, Donalsonville, Ga., Atlanta College of Physicians and Surgeons, 1907, member of the Medical Association of Georgia, served as mayor of Donalsonville and as president of the chamber of commerce, aged 58, died, March 15, in Dothan of carcinoma of the lung.

Charles Wadhams Stevens † New York, College of Physicians and Surgeons, New York, 1892, formerly assistant professor of clinical ophthalmology at the New York Post-Graduate Medical School, Columbia University, veteran of the Spanish-American War, captain in the medical reserve corps of the U. S. Army not on active duty, for many years on the staff of the New York Post-Graduate Medical School and Hospital, aged 75, died, March 15, of heart disease.

George Edward Stevenson, Penn Yan, N. Y., Baltimore Medical College, 1895, member of the Medical Society of the State of New York, served during World War I, on the staff of the Soldiers and Sailors Memorial Hospital, aged 72, died, March 20, of coronary occlusion.

Le Roy Ray Stoddard, New York, New York Homeopathic Medical College and Hospital, New York, 1900, aged 66, was found dead in a hotel in Baltimore, March 18, of chronic myocardial degeneration.

Benjamin Strong, Lamar, Miss., University of Pennsylvania Department of Medicine, Philadelphia, 1891, member of the Mississippi State Medical Association, aged 79, died, March 15, of carcinoma of the stomach.

Hugh Nathan Sullivan, Ellendale, Tenn., Memphis Hospital Medical College, 1906, aged 60, died, March 14, in Memphis of arteriosclerosis and heart disease.

Albert Hamlet Sweeney, Fresno, Calif., Cooper Medical College, San Francisco, 1897, formerly health officer of Fresno, for twenty-five years division surgeon for the Santa Fe Railroad, aged 73, died, March 1, of heart disease.

Sherman Clark Sweeting, Pavilion, N. Y., Hahnemann Medical College and Hospital, Chicago, 1890, health officer of the towns of Covington, Bethany and Pavilion, aged 77, died, March 18, in the Wyoming County Community Hospital, Warsaw, of heart disease.

Joshua Tayloe † Washington, N. C., University of Pennsylvania School of Medicine, Philadelphia, 1923, fellow of the American College of Surgeons, past president of the Beaufort County Medical Society and the North Carolina Urological Society, vice president of the Seaboard Medical Society, chief of staff of the Tayloe Hospital, aged 44, died, March 5, of coronary thrombosis.

Arvid Ouchterlony Taylor † Maysville, Ky., University of Louisville Medical Department, 1906, formerly member and president of the board of education of Maysville, a member of the Mason County Board of Health, aged 59, died, March 9, of coronary occlusion.

Charles Byron Ward † Seattle, University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1908, specialist certified by the American Board of Radiology, Inc., member of the American Roentgen Ray Society, the Radiological Society of North America, Inc., and the American College of Radiology, aged 60, on the staff of the Providence Hospital, where he died, March 28, of coronary thrombosis.

Benjamin N. Watt, Washburn, Ill., Rush Medical College, Chicago, 1884, aged 88, died, March 10, of cerebral hemorrhage.

Villiers James Webber † Fairhope, Ala., American College of Medicine and Surgery, Chicago, 1906, served during World War I, aged 64, died, March 8, of pellagra.

Nels Werner † Eau Claire, Wis., Rush Medical College, Chicago, 1904, for many years on the staff of the Midelfart Clinic, on the staffs of the Luther and Sacred Heart hospitals, aged 63, died, February 26, of heart disease.

Jesse David Westmoreland, Belzoni, Miss., Memphis (Tenn.) Hospital Medical College, 1904, aged 68, died, March 17, in the King's Daughters' Hospital, Greenville, of cerebral hemorrhage.

Florilla Mansfield White, Palm Springs, Calif., Boston University School of Medicine, 1908, aged 71, died, March 15, of cerebral hemorrhage and arteriosclerosis.

DIED WHILE IN MILITARY SERVICE

Robert Anthony Kilduffe † White Sulphur Springs, W. Va., University of Pennsylvania School of Medicine, Philadelphia, 1913, member of the American Society of Clinical Pathologists, the Society of American Bacteriologists and the Association of Military Surgeons of the United States, formerly vice president of the New Jersey Society of Clinical Pathologists, served in France as chief of the bacteriologic division on the staff of the chief surgeon of the American Expeditionary Forces during World War I, formerly director of the laboratories of the Pittsburgh Hospital, while a resident of Atlantic City, N. J., was director of the laboratories of the Atlantic City Hospital and city bacteriologist, serologist to the Municipal Hospital and the Atlantic County Hospital for Mental Diseases, Northfield, pathologist and serologist to the Betty Bacharach Home for Crippled Children and pathologist to the Jewish Seaside Home for Children, began active duty Oct. 1, 1942 as a major in the medical corps of the Army of the United States, assigned to the Ashford General Hospital as chief of the laboratory service, editor of the *American Journal of Clinical Pathology*, associate editor of the *Journal of Laboratory and Clinical Medicine* and of the *International Medical Digest*, author of several manuals of laboratory procedure, co-author of "The Blood Bank and Technique and Therapeutics of Transfusion", aged 58, died suddenly, April 5, of coronary occlusion.

CORRECTION

Dr. Edward Herzog Is Not Dead—Information has been received that Dr. Edward Herzog of Long Island City, N. Y., is living. *THE JOURNAL*, March 6, page 781, erroneously reported the death of Dr. Herzog.

ARMY-NAVY MEDICAL TRAINING PROGRAM

To the Editor—The sweeping new Army-Navy program, proposed to go into effect this June, deserves some comment at this time. The program includes fifteen months of "premedical" education and three years of concentrated formal medical education followed by a year of internship.

The practice of medicine is still both an art and a science. The country doctor, of whom the whole profession is proud, practiced more of the art than the science. But, to practice the art of medicine requires two essentials: culture and maturity. Today is an age of dehydration and compression but neither culture nor maturity can be compressed. As far as the science is concerned there are many men, not of the production line species, who are still learning after years of faithful application. The scientific method demands background, experience and attention to detail.

I am not so far removed from my school days to remember that I spent a considerably longer period than fifteen months to master the elemental sciences. I recall that I spent a considerably longer time to acquire what little culture I have. It might also be noted that I emerged from school capable of thought and insight into the physician's responsibilities to society.

Dr O. H. Perry Pepper, anticipating that our nation was approaching a crisis, sounded the note that we attempt to continue our education by our own efforts. He had the foresight to see that war would prevent one from entering the specialties as he delivered his final lecture to the graduating class. The plea of a great teacher to well educated men probably was made because he must have known that their experience was only beginning, not after five and one quarter years of "compressed" education, but after nine years of learning.

There are young men in our colleges now who want to study medicine. There are also men who would study medicine to escape more arduous tasks rather than out of a humanitarian bent. Let us beware that among the good barrel of apples rotten ones do not occur. This, then, is the plea that the standards and quality of our learning be maintained. Let us not forget we are mature in thought and that a heritage of culture has been passed on to us, not by education but by learning.

THOMAS MAXWELL First Lieutenant M C A U S

"Q FEVER"

To the Editor—My attention has been called to an article in THE JOURNAL (March 13 p. 828) entitled "Q Fever." Since the basis for the diagnosis of Q fever in this reported case was certain serologic tests done in this laboratory, I feel that two comments should be made. First, the diagnosis of Q fever was made on a complement fixation test the titer of which was only 1:4. Those interested in this test at this laboratory feel that such a titer is not significant particularly during the acute illness or early in the convalescence. Second, the article reports other serologic tests done at this laboratory but fails to mention that an agglutination of 1:80 against Eberthella typhosa was obtained. This was on a sample of serum submitted on August 11, some two and one half weeks after onset (July 25). In the case report there was no record of additional studies done later in the forty six day febrile illness.

It is felt then that this case reported as Q fever certainly had no confirmation in the laboratory and further that it was more suggestive of belonging to the group of long continued fevers than to the rickettsioses.

R. E. DYER M.D., Bethesda, Md

Director, National Institute of Health

[On receiving a copy of Dr. Dyer's communication, the author replied.]

To the Editor—I appreciate your sending me the criticism of my paper on Q fever. With regard to the omission of the typhoid test being positive 1:80, it is truly an omission that I was entirely unaware of. Fortunately I had saved all my data and many copies of the paper as it was written. The paper was rewritten and corrected many times in order to get it in correct form and that test was in the first typewritten copy, but evidently my secretary in recopying it several more times omitted it accidentally along with B paratyphoid A negative. In fact the entire line was omitted and I did not realize it until now. I was careful to be as exact as possible and to give credit where credit was due. You will note that the stool culture for typhoid also was negative.

As to the positive complement fixation test for Q fever 1:4, I asked about this in both of our hospital laboratories at the time, and it was felt that a 1:4 complement fixation test was definitely positive. I was not familiar with this test as it was new and I know little about the details of such a test but am surprised that it was not considered a positive test.

The criticism is rather severe and not entirely correct, as a clinical diagnosis was temporarily made on the finding as described in Manson's Tropical Diseases on Q fever. The following correction should be made because of the omission: Blood serum taken on Aug. 11, 1942 was reported as follows on August 22: Eberthella typhosa positive in dilution 1:80 and Eberthella paratyphosa A negative. To my mind this does not alter the case, for the weight of evidence points to Q fever.

The omission was accidental and if the complement fixation test of 1:4 was not conclusive, it was ignorance on my part.

F. EUGENE ZEMP M.D. Columbia, S.C.

IRRADIATION OF THE SPLEEN AND PITUITARY FOR CONTROL OF PUBERAL BLEEDING

To the Editor—Some inaccuracies in the article by Dr. Ira I. Kaplan in THE JOURNAL of April 10 require comment and adjustment. Irradiation of the pituitary gland for the control of uterine bleeding in the adult was first advocated by me in 1922 and 1923 (Arch. f. Gynak. 117:230, 120:194). This entirely new method was based on clinical and experimental evidence showing impairment of the development and the integrity of structure and function of the female generative tract as the result of destruction of the anterior lobe of the hypophysis or of damage to the midbrain. The fact that no harm may result from the application of properly screened hard roentgen rays to the brain of the adult emerged from the careful studies of Hemeke, Lacassagne and Birch Hirschfeld while the investigations of Obersteiner revealed that the less resistant brain tissue of the adolescent organism may sustain microscopically demonstrable damage. Initially suppression of abnormal pituitary stimuli to the ovaries and hence regulation of excessive uterine bleeding constituted my professed purpose in applying x-rays to the hypophysial region. The results obtained with this novel treatment eloquently demonstrated the usefulness of the procedure. In view of my experimental evidence showing a distinct relationship between excessive anterior pituitary hormone activity and small cystic ovarian degeneration resulting in the overproduction of estrogenic substances and in turn of endometrial overgrowth (Surg. Gynec. & Obst. 22:222 [Feb.] 1931; J. Obst. & Gynec. Brit. Emp. 46:232 [April] 1939), a check on the pituitary impulse by irradiation appeared an obvious rationale. Indeed satisfactory relief of polycystic ovaries by the treatment under consideration has been reported (Stein, I. F., and Leventhal, M. L. Am. J. Obst. 29:181 [Feb.] 1935).

Further elaboration revealed numerous startling phenomena. As stated in the two articles which I have referred to, some uterine fibroids which had been irradiated directly before shrank considerably after one or two irradiations of the hypophysis. The reports which I published were substantiated by other observers indicating that the growth hormone of the anterior pituitary may bear some etiologic relationship to the origin of such tumor formation. Increase of the red blood count and the number of eosinophils represented another remarkable phenomenon. Particular interest attached to the observations which I made of reduction in the size of the hyperplastic thyroid following pituitary irradiation. In the light of the demonstration of the thyrotropic principle residing in the anterior pituitary some years afterward the explanation of this phenomenon is due to the suppression of the hyperactivity of this principle offered itself. Treatment of hyperthyroidism by pituitary irradiation was advocated twelve years later by Borik (*Radiology* 21:555 [May] 1935). It is worthy of note that quite recently this novel thought of influencing the hyperplastic thyroid by hormones directly or indirectly related to the hypophysis has come to the fore (Alton Ochsner). Incidentally it is pertinent to note the influence which pituitary irradiation has exercised on other conditions such as on the radiosensitive basophilic infiltration in posterior lobe hyperfunction (Pendergrass, Hodges and Griffith, *Int. J. Radiat. Oncol.* 16:675 [Nov.] 1941; Hutton, Cushing). On the other hand clinical observations of the occurrence of diabetes insipidus, a temporary and of adipose genital atrophy (H. Hirsch) in the wake of pituitary irradiation in young persons provided a warning note that this treatment should be used with discernment. In harmony with the experimentally established fact mentioned that the brain of the growing organism may be injured by the application of radiant energy I feel that pituitary irradiation has no place in the treatment of gynecologic disorders in persons under 20 years of age irrespective of the dosage and method properly selected.

I. I. Hathwaite, M.D., Cincinnati

COLOR BLINDNESS IN PHYSICIANS

To the Editor.—In the *JOURNAL* April 17 I noted a query in regard to a medical student who is color blind. I claim to be an authority on the vicissitudes of color blind doctors and would like to give him the benefit of my experience. In 1917 I was rejected for the Army because of color blindness. In 1918 I was accepted as a flying cadet and served out the duration without being bothered with any colors at all. In 1926 misfortune caught me again when I attempted to obtain a commission in the Medical Corps and I was rejected for color blindness. This discouraged me somewhat and I have not been encouraged any by remarks of present day Army and Navy medical examiners. I have never had any difficulty in the practice of medicine other than in laboratory work and I didn't like that anyway. Now as to laboratory work, I accept tubercle bacilli and mitotic figures on faith alone, never having been able to see any. I would suggest to the student who is color blind that he be nice to the student next to him in the laboratory, preferably a female, and she will prove of inestimable value to him when it comes to colorimeters and such like. Also don't try to join the Navy or Air Force, as they are God's elect and won't have any color blind misfits. One other point. When he gets out of school, all of his friends will on occasion grab some piece of colored cloth and demand to know what color it is. This, I think, is justifiable ground for homicide. In conclusion, never argue with the Ishihara color test because he will always be wrong. However, we can see a lot of things in that which normal individuals can't see, so why worry?

G. A. Davidson, M.D., Dallas, Texas

MEDICAL VOLUNTEERS FROM BROOKLYN

To the Editor.—I noted with chagrin the inclusion of Brooklyn in the list of cities mentioned by you editorially on March 27 in which the number of physicians responding to the call of the Procurement and Assignment Service was far below quota. I feel quite sure that your inclusion of Brooklyn in this list was because of the fact that you were not in possession of the exact factual data, which I therefore herewith enclose. The total number of doctors in Brooklyn is 5,190, of which total there are now 2,004 in active service with the Army or Navy and about 50 more in other government services. There are about 51 more in process of receiving their commissions. You will note therefore that this would make 41 per cent of physicians in Brooklyn under the age of 64 in active government service. You will agree, I am sure, that this is an enviable record of which we are duly proud.

BENJAMIN M. BERNSTEIN, M.D., Brooklyn
Secretary, Medical Society of the County of Kings

COMMENT.—On Nov. 30, 1942, metropolitan New York, which included Bronx, Kings, Nassau, New York, Queens, Richmond, Rockland, and Westchester counties still required 3,307 physicians to fill their quotas. Since that time there have been less than 1,000 physicians who have gone to active duty from the entire state of New York. Apparently most of the shortages are in other counties than Kings.—Ed

SIMPLIFIED TECHNIC IN CONTINUOUS CAUDAL ANALGESIA

To the Editor.—Caudal analgesia in obstetrics as advocated by Drs. Hingson and Edwards is the second great step for the amelioration and the alleviation of the pain and anguish of child birth. The first was the introduction of chloroform to the practice of obstetrics.

My limited experience with caudal block has been satisfactory thus far to the women and to me.

There will of course, be many improvements in the original technic. The principal purpose of the apparatus used and described by the originators was to maintain a closed aseptic circuit and for the maintenance of a constant analgesic affect during all of the labor after the first insertion of the needle into the caudal canal.

I should like to describe a simpler closed circuit technic that can be used and watched over by personnel trained in obstetrics other than the attending obstetrician or anesthetist, the purpose being to make caudal analgesia available to all the private semiprivate and ward patients. Most hospitals have personnel well versed in determining the progress of labor, this trained group can well be entrusted with the added duty of watching over the effects of caudal analgesia.

The original technic as described by Hingson and Edwards is followed through the injection of 8 cc. of metycaine. At this point the technic varies. The syringe is disengaged from the caudal needle. A sterilized 2 inch rubber tube, closed at one end with an adapter to fit the needle at the other end, is fitted by its adapter into the needle hub and a closed sterile circuit is instantly created. The next 22 cc. of metycaine and all subsequent instillations are made through injections directly into the rubber tubing, which has first been wiped clean and sterilized with alcohol in much the same manner as any subcutaneous or intravenous injection.

After the insertion of the needle into the rubber tubing, slight negative pressure created by traction on the syringe piston can show whether there is any spinal fluid leakage. Following each instillation of metycaine the protruding needle hub with the attached rubber tube is wrapped in soft cotton and held in the fold of the buttocks with a few strips of adhesive tape.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Hospitals in General A Hospital Not a "Public Housekeeping Establishment" Within Meaning of State Minimum Wage Law—The plaintiff was employed in March 1937 by the Trinity Hospital Association of Minot N D a nonprofit corporation as a public housekeeper at a monthly stipend after the first five weeks of \$20 plus board room (which she apparently never utilized) laundry and free hospitalization in case of sickness. The North Dakota minimum wage and hour law as amended (Laws 1935 ch 162) empowers the commissioner of agriculture and labor to ascertain and declare minimum wages and the commissioner acting in pursuance thereof promulgated a so called Order No 1 which provided stated minimum weekly wages for various types of employees in public housekeeping establishments in the state the applicable minimum of which exceeded the equivalent periodical stipend of the plaintiff. She subsequently brought suit against the hospital to recover the difference between the wages paid her during the period from 1937 to 1940 and the applicable minimum set out in Order No 1. The hospital denied liability, defending principally on the ground that the order relied on by the plaintiff did not apply to employment in nonprofit hospitals in North Dakota. From a judgment for the plaintiff the hospital appealed to the Supreme Court of North Dakota.

The sole question for our determination said the Supreme Court of North Dakota is whether or not the plaintiff is within the class of employees covered by Order No 1. Order No 1 refers only to employees of any public housekeeping establishment. No other class of employees is included. Therefore the plaintiff to claim the benefit of Order No 1 must bring herself within the class of employees covered by the order. The word hospital in general usage in the minds of the public is an institution in which the sick and injured are cared for. It is a place where patients receive medical attention. It is not a place like an inn or hotel where people go for food and entertainment. It is true a hospital must serve food to its patients as an incident to their care and treatment but it is not a public housekeeping establishment. Only the sick or injured are admitted to a hospital. It is not open to the public generally like a restaurant or hotel. The difference between a public housekeeping establishment such as a hotel inn or restaurant and a hospital is clearly explained by the Supreme Court of Iowa in *Hull Hospital v Wheeler* 216 Iowa 1394 250 N W 637. In that case a patient in the Hull Hospital in addition to care medicine and hospital supplies received board and room. The hospital sought to obtain an innkeeper's lien on certain rings belonging to the patient left in the custody of the hospital. By Code Iowa 1930 Section 10348 a hotel is given a lien on the baggage of its guests and hotel is defined to include inn rooming house and eating house or any structure where rooms or board are furnished whether to permanent or transient occupants. The Supreme Court of Iowa there said:

Although the denotation of the word hotel is thus extended nevertheless there is a plain limitation upon the kind of business that shall constitute a hotel. A hotel keeper entertains his guests. He furnishes them food drink shelter and lodging. Likewise an eating house furnishes its patrons food and drink. So too a rooming house provides the roomer with lodging and shelter.

On the other hand a hospital where the sick and injured are cared for nurses its patients and gives them medical attention. Obviously the room and board provided by the hospital are merely incidental to the nursing and medical treatment it not part of it. For instance a guest goes to a hotel for lodging shelter food and drink. Such is the purpose of the hotel. When a man is sick however he goes to the hospital not merely for food drink lodging and shelter but rather for nursing and medical care.

Plaintiff therefore the appellant [the hospital] is not entitled to a lien on the rings in the case at bar because a hospital is not a hotel.

While hotel restaurants and inns continued the Supreme Court of North Dakota may come under the classification of public housekeeping establishments since the main purpose of such institutions is to furnish food shelter and entertainment to guests. A hospital is not a public housekeeping establishment.

since its main purpose is to care for and give medical attention to sick, wounded and injured patients. The legislature in the passage of the minimum wage and hour law did not make it mandatory on the commissioner of agriculture and labor to take jurisdiction of all employees in the state. So far the commissioner has not made any order covering employees of a hospital and therefore there is no basis for recovery here. Whether or not the commissioner has a legal right to promulgate orders covering employees of charitable nonprofit corporations, therefore, is not involved in this case.

The judgment in favor of the hospital employee was reversed.—*Paul I. Trinity Hospital, 158 N. H. (2d) 392 (N. D., 1912)*

Workmen's Compensation Acts. Inhalation of Sewer Gas as Efficient Cause of Perforation of Duodenal Ulcer

Dauber was able to work although suffering from a stomach ulcer causing a pyloric obstruction on a diet prescribed for him by Dr. Bank, a stomach specialist whom he consulted in June 1911. In the course of his employment with the City of Phoenix, Ariz., on Oct. 4, 1911, he was cleaning out a sanitary sewer pipe line. It was his duty to descend into a manhole to clean out the mud and slush that would be forced down the pipe line by water pressure and rodding against a tunnel shaped object made of cinders. Sewer gas was released by this process and passed through the opening in the top of the pipe into the manhole. While in the manhole about 5 p. m. all of a sudden a cloud of gas came in and rendered the workman unconscious. He was pulled out of the manhole. When he regained consciousness about fifteen minutes later he was greatly nauseated and began vomiting. He was taken home and put to bed but continued to suffer from severe nausea. Dr. Shupe was called in about 8 o'clock that evening and administered morphine "to quiet him and decrease his vomiting." However, the nausea returned as soon as the effect of the narcotic wore off, and about 10 p. m. the following evening he was taken to a hospital. Nausea nevertheless continued until about 8 p. m. on October 6, when a perforation of his stomach occurred followed by severe peritonitis. Immediately afterward Shupe performed an emergency operation and repaired the perforation. Dauber was still totally disabled at the time of a hearing held on Feb. 11, 1912, in proceedings he instituted to recover compensation under the workmen's compensation act of Arizona. At the hearing Dr. Bank, whom Dauber had consulted the previous June, testified that in his opinion inhaling the sewer gas would aggravate the ulcer from which Dauber was suffering and that a perforation of an ulcer of the stomach is caused by aggravation of the ulcer. Dr. Shupe testified that sewer gas poisoning induces nausea and vomiting and that in his opinion inhaling the sewer gas was the efficient cause of the rupture of the ulcer from which Dauber was suffering at the time of the alleged accident. The industrial commission, however, denied compensation on the ground that the evidence did not show that the disability from which Dauber was then suffering was the result of an accidental injury sustained while in the course of his employment. It reaffirmed its denial of compensation on a rehearing held about three months later, and Dauber appealed to the Supreme Court of Arizona.

Dauber contended that his mishap was an accident within the meaning of the workmen's compensation act and that the action of the commission was contrary to the evidence and should be set aside. It is elementary, of course, said the court, that Dauber before he is entitled to compensation must show that his injury was the result of an accident within the meaning of the workmen's compensation act. The court was of the opinion that the sudden and unexpected coming into the manhole of a cloud of sewer gas in sufficient quantity to render Dauber unconscious was an accident within the meaning of that term as used in the workmen's compensation act. Even though a small quantity of gas, said the court, is usually looked for in such places as those in which Dauber was working, the sudden appearance of such a quantity of it as to render him unconscious was wholly unexpected. Neither Dauber nor any one else who thought the gas might escape into the manhole in such dangerous quantities during the process of cleaning the sewer pipe would have ventured into the manhole where he would breathe it with such serious consequences. Dauber had smelled the

gas many times before in small quantities, but this was the first time that a cloud of it had come into the manhole where he was working and, this being true, it cannot be said that he should have known it would be there in such a dangerous quantity and that he assumed whatever risk there was in contacting it. As was said in *Van Vleet v. Public Service Company of York*, 111 Neb 51, 195 N. W. 467.

While the evidence shows that passing in a mild form is not uncommon among gas workers, it is equally proved that for workmen to be overcome to such an extent as to produce unconsciousness is very uncommon.

A somewhat similar statement is also found in Taylor's Principles and Practices of Medical Jurisprudence, volume 2, page 573, where, in a discussion of poisoning by sewer gas and exhalations from dead bodies, the following statement is made:

The cases are always accidental, though it is easily conceivable that a suicide or homicide might thus be effected.

Hence, the passing into the manhole of a cloud of gas which rendered Dauber unconscious was an untoward and unexpected event and clearly constituted an accident within the meaning of the compensation act.

The next question, said the court, is whether or not the accident resulted in injury to Dauber. The testimony of the only two physicians who appeared as witnesses in the case is that the inhalation of the sewer gas had the effect of perforating and rupturing his stomach and that this necessitated an emergency operation. The two physicians agreed that the nausea, retching and vomiting produced by the accident caused the injury. According to Dr. Shupe the retching and vomiting were the efficient cause of the rupture of the stomach ulcer, though Dr. Bank's view was that, while the retching and vomiting were factors in producing the rupture, the more important factor was the absence of food, which, because of acid, increased erosion of the stomach. So whether the rupture was produced by the retching and vomiting or by the absence of food in the stomach for so many hours is immaterial, since both of these conditions were the result of the nausea and vomiting brought about by the accident, the inhalation of the sewer gas. The fact that the gas itself may not have been the direct cause of the rupture is immaterial, it would be just as much the efficient cause thereof if it set in motion the agencies that did produce it—nausea, retching and vomiting—as it would have been had it caused it directly, and there can be no question but that the nausea, retching and vomiting were brought about by the accident. The fact that at the time of the accident, and for some months prior thereto, Dauber had been suffering from a duodenal ulcer did not deprive him of the right to compensation, since the accident was the cause of the rupture, for even though the perforation of the stomach would not have resulted from the accident had it not been for its weakened condition produced by the ulcer, his right to compensation for the injury was in no way affected thereby. When an accident aggravates a diseased condition, the rule established by the decisions of this court is that the workman is as much entitled to compensation for the injury as he would have been had it occurred while he was in a healthy condition.

The court accordingly set aside the award of the industrial commission denying compensation to the workman—*Dauber v. City of Phoenix*, 130 P. (2d) 56 (Ariz., 1942).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (5 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending, but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Malnutrition in Chronic Schizophrenia—Baganz and Norris determined the extent and degree of the malnutrition of 374 schizophrenic patients on admission and after they had been hospitalized up to eight years. In their determination they considered the height, the age and the degree of activity of each patient. For comparison the nutrition of the total hospital population was studied. On admission the malnutrition of patients with chronic schizophrenia was not significantly different from that of the entire hospital population. However while the entire hospital population changed little in the extent of malnutrition after admission there was a significant increase in the degree of malnutrition of the schizophrenic patients after eight years of hospitalization. The proportion of patients 10 or more pounds (4.5 Kg) underweight was approximately 50 per cent greater among those with chronic schizophrenia studied than among the entire hospital population and the same proportion was true of those with schizophrenia 20 or more pounds (9 Kg) underweight. The more active patients appeared to have the

lowest extent and degree of malnutrition. The extent and degree of malnutrition was apparently completely independent of the serving of an adequate caloric diet. The degree of malnutrition associated with chronic schizophrenia may offer an explanation for some of the common changes observed in the cardiac shadow and described as the "longitudinal heart of the precox."

Influence of Estrogens on Genuine Preeclampsia and Eclampsia—Shute reports the use of estrogen in the treatment of eclampsia in 11 women. It is unfortunate that certain workers have on this basis begun to administer simultaneously prodigious doses of estrogens and progesterone, which are antagonistic substances. All of the author's preeclamptic patients remained ambulant. As estrogen is more effective in preeclampsia than in eclampsia it should be used for prophylaxis rather than for therapy. Recognition of preeclampsia is the crux of the situation for which a blood estrogen assay is a sine qua non. Unless the assay method is used this therapeutic method will be discredited, for estrogens given to noneclamptic women may actually do harm perhaps precipitate abruptio placentae.

Methyl Glucamine Ascorbate as Solvent for Arsenical Drugs—In the last two years Beerman, Pariser and Wammock have evaluated the value of a vitamin C solvent for arsenical drugs in 114 syphilitic patients who had reactions which necessitated the withdrawal of trivalent arsenicals. The solvent used contained methyl glucamine ascorbate equivalent to 60, 100 and 500 mg. of ascorbic acid in 10 cc. of a 7 per cent solution of

sucrose. This form of treatment definitely prevented a recurrence of the reaction in 58 per cent of the 111 patients, in 243 per cent the good effects that occurred could not with certainty be ascribed to the use of the solvent and in 177 per cent produced no appreciable effect in the prevention of nausea, vomiting and intratend crises. The solvent containing the 100 mg dose was especially effective.

Surgical Treatment of Tophaceous Gout—Linton and Talbott base their report on the surgical treatment of the tophaceous gout of 10 men and 1 woman from 20 to 80 years of age. 8 of them were more than 50. 2 were in their twenties and 1 was in the ninth decade. Seven of the patients had had their gout for twenty or more years. 2 for ten to twenty years and 2 for seven years. The surgical treatment of gout is applicable only to patients in whom large tophaceous deposits have developed. Surgery on the 11 patients was limited to the removal of uric deposits which involved the bony and soft structures about the elbows, forearms, wrists, hands and feet. The indications for surgical treatment are cosmetic reasons, pain, interference with movements, discharging sinus and extensive phalangeal involvement of the fingers or toes. Forty-six operative procedures were undertaken on the 11 patients. An analysis of the lesions revealed thirty-one subcutaneous tophi, thirty-six involving tendons and adjacent structures and twenty-six which arose from joints with invasion of bone and soft tissue. Of the ninety-three tophaceous deposits operated on only approximately 5 per cent occurred at the great toe. The surgical procedures on the hands were and should, of necessity, be more conservative than those on the feet. Follow-up studies six months or more postoperatively or to the death of the patient showed that in only three out of the ninety-three tophaceous deposits were there recurrences of any size, one was in the finger of a woman with extensive deposits, one was a recurrence of tophus in the flexor tendon in the palm because removal had been incomplete and one of the fingers was among the earlier operations in which complete removal of the tophaceous deposit had not been obtained. Relief from pain followed the surgical removal of the tophaceous deposits in all the patients, 4 patients with extensive involvement of the feet, who were unable to walk or could walk only with extreme pain, were rehabilitated so that they could get about without pain. The 8 patients who had painful tophi removed from the hands and fingers obtained decided relief of symptoms and considerable functional restoration. Since good results are possible by the surgical removal of tophaceous deposits, even late in life, it is recommended that surgery be done earlier in the course of the disease than usually is considered desirable.

Morphine and Antispasmodics in Biliary Colic—Best and Barr carried out a series of experiments on the problem of relieving biliary colic. An antispasmodic drug which would consistently relax the wall of the gallbladder, the region of the cystic duct and the sphincter area at the lower end of the common duct would not only hasten and prolong the relief obtained by the necessary morphine but might also prevent further extension of the pathologic process by permitting free drainage of the biliary tract. With an intact gallbladder, biliary pain is most frequently due to increasing pressure within the gallbladder. With a pathologic gallbladder, the choledochal sphincter may or may not be in a spastic state, causing increased pressure in the biliary ducts which would also contribute to the pain. Atropine could be indicated, as at times it definitely relaxes the sphincter area or at least raises its threshold of irritability. Since this spastic state of the choledochal sphincter may be contributing to pain accompanying the gallbladder colic, morphine hypodermically and glyceryl trimurate orally should be tried thirty minutes to a few hours later if the morphine-atropine combination has not given relief. Either atropine or glyceryl trimurate should be given with morphine to help counteract the tone or spasm stimulating effect of the morphine on intrabiliary pressure. For patients who have had a previous cholecystectomy the morphine and glyceryl trimurate combination should be tried first for biliary colic and if it does not afford relief a morphine-atropine injection should be given. Probably the morphine-atropine combination should be tried first for patients with an intact gallbladder and then the atropine with glyceryl trimurate alternately every four hours. Morphine should be used in the four intervals only as needed. This may be continued for several days in the hope that the cystic duct will become sufficiently relaxed to permit egress of thick bile from the gallbladder into the common duct and then the sphincter of Oddi would be sufficiently relaxed to permit the bile to pass into the duodenum. When the gallbladder has been removed, the morphine-glyceryl trimurate combination is most apt to give relief. The glyceryl trimurate is then alternated with atropine every four hours for several days and morphine is added as necessary.

Pathology of Burns—Erb and his associates discuss pathologic changes in 61 fatal burn cases. Tannic acid was used in 41 and was not used in 20. The more important changes remote from the burned area involved liver, kidney, gastrointestinal tract and adrenal, with infection of one sort or another superadded. Duodenal ulcer was observed in 5, esophagitis or esophageal ulceration in 5, early gastric ulcer in 3 and adrenal hemorrhage in 4. Of the 41 patients whose burns were tanned, 25 presented hepatic necrosis. The shortest time that a patient survived after the burn in whom necrosis was found was six hours, the longest was nineteen days, 17 died within three to five days. Death up to the fifth day was attributed to toxemia and thereafter to infection. Signs of hepatic reparation were noted in each of 5 patients who died between the eighth and the nineteenth day. Of 27 patients dying within three to nineteen days only 3 were free from hepatic necrosis. Hepatic necrosis did not occur in any of the group whose wounds were not tanned. 7 of whom died within three to fourteen days. Renal damage was observed in 19, and for all but the burn of 1 tannic acid was used. Following the introduction of tannic acid in 1925 the mortality rate from burns fell from 35.2 to 11.8 per cent and after the use of sulfonamides and other measures it fell to 2.9 per cent. Also with the introduction of tannic acid the time of death shifted from the first twelve to thirty-six hours to the period of toxemia, the third to the sixth day, the period in which hepatic necrosis is most frequently observed. Patients dying with hepatic necrosis, apart from those dying of sepsis presented, on the whole, the same clinical picture of toxemia as did those without hepatic necrosis for whom tannic acid was not used and who died during the same period. Therefore hepatic necrosis, whatever its cause, is not necessarily the cause of death, although it may be a serious complication. Some therapeutic agent to be used with tannic acid should be sought which would preserve the benefits of tannic acid and at the same time protect the liver from the necrosis resulting from the absorption of a toxic substance from the burned skin and/or the direct or indirect result of tannic acid.

Metastasis of Mixed Tumors of Salivary Glands—Mulligan's review of the localization of the metastases of 20 previously reported cases and 1 of his own shows that metastases were present in the lungs of 18 the pleura of 12 the liver of 10 the bones of 8 the lymph nodes of 6 the kidneys of 3 and the spleen of 2. The term cylindroma was employed in the microscopic description of the tumor of 8. In 4 others from the description given this same appearance was present. In 5 the designation was mixed tumor in 2 adenocarcinoma and in 2 malignant glandular epithelioma and alveolar sarcoma. The data suggest that when a patient in the fourth to the seventh decade of life has a tumor of a salivary gland a thorough examination must rule out metastasis; if operation or irradiation of the primary tumor is contemplated.

Lead and Bronchiogenic Carcinoma—Lead and radium belong to the same chemical family. As commercial lead contains varying amounts of radioactive substances, usually radium D, it should be considered as a possible inciting factor in bronchiogenic carcinoma when its dust and fumes are inhaled over long periods. In the 2 cases that Black presents there was continuous exposure to lead for many years. That carcinoma may not manifest itself until many years after exposure to irritating dusts was borne out by the cases. The first patient had recurrent attacks of lead intoxication and an amount of lead in the urine indicating that lead was actually taken into the body. At necropsy chronic fibroid pneumonitis was found in both patients suggesting some form of chronic irritation.

Sulfanilamide as Prophylactic in Rheumatic Fever—Chandler and Taussig state that in the 16 patients to whom they gave sulfanilamide as a prophylactic for two seasons and in the 9 so treated for one season (forty-one patient seasons) a questionable recurrence of rheumatic fever occurred in only 1. In a comparable group of control patients 17 observed for two seasons and 7 for one season there were five recurrences. Studies of the beta hemolytic streptococci isolated from the patients' throats permit no conclusions but they do suggest that an investigation might be undertaken on a larger series of patients. In the sulfanilamide group 3 patients harbored group A streptococci for considerable periods of time. Antibodies were present for prolonged periods in 2 of the 3. Homologous antibodies were also present in 2 patients who harbored group C organisms for some time. In the control group 7 patients had streptococci at some time; the organisms were isolated only once in each of them.

Analysis of Pneumonia Deaths—Meakins and McKenna analyze 21 fatal cases of (pneumococcal) lobar pneumonia treated in the Royal Victoria Hospital during three years. All deaths occurred from infections with the lower types (through XIV) of pneumococci. The mortality rate of 10.5 per cent (21 of 200 cases) was comparable with that of most figures. The sex incidence of mortality was exactly proportional to that of the incidence of the disease 3 males to 1 female. All deaths except those of 2 infants were of persons more than 40, the average age of the patients who died was 56.3 years and that of the survivors was 36.1. The mortality rate among type III infection was disproportionately high (23.5 per cent). At least 10 of the patients who died had bacteremia. Malnutrition or associated disease (involving the cardiovascular system, lungs, kidneys, liver or sinuses) was present in more than 90 per cent of the patients who died and in only 29 to 32 per cent of the survivors. It is suggested that the recognition of nonspecific factors both in the determination of the prognosis and in the management of the disease would further lower the mortality rate from pneumococcal lobar pneumonia.

Hypertrophic Gastritis—Benedict applies the term hypertrophic gastritis to the findings on gastroscopy of numerous verrucous elevations in the gastric mucosa, beading or caterpillar-like appearance of the rugae and dulness or diminished highlights in the mucosa. Among 1,500 gastroscopies he diagnosed hypertrophic gastritis without other gastric or duodenal pathologic changes in 117 (9 per cent). Of the total, 61 per cent were in males. The disease rarely occurs before 20 or after 70. The symptoms of hypertrophic gastritis in the order of their frequency are epigastric pain, vomiting, gas, sour eructations, heartburn and nausea without vomiting. There is no specific treatment. Of the 92 patients 26 were relieved by a bland diet alone and 72 by a bland diet with or without belladonna, alkaline powders, aluminum hydroxide, hydrochloric acid or liver therapy. Nine patients were not relieved by diet, 2 were not relieved by alkaline powders, 1 was not relieved by belladonna and of 5 operated on 3 were relieved. The improvement seen at subsequent gastroscopy was definitely correlated with the clinical improvement in most instances. The expert roentgenologist using the relief technique may be helpful in suggesting a possible diagnosis of gastritis, but only gastroscopy permits a positive diagnosis or differential diagnosis between the superficial, atrophic and hypertrophic forms. In differentiating some severe and doubtful cases of hypertrophic gastritis from carcinoma, gastrotomy and biopsy should be performed.

Proteins in Serum and Postoperative Gastric Retention—Chauncey and Gray estimated the concentration of protein in the serum of patients during the normal postoperative period of various surgical procedures on the upper portion of the gastrointestinal tract. There was a normal decline in the concentration of the total proteins and a decline in the concentration of the two fractions, the decline of the albumin fraction was slightly more pronounced than that of the globulin fraction. After the fifth postoperative day there was a steady and persistent increase in the concentration of total proteins and the albumin and globulin fractions. A concentration of less than 52 Gm of total protein per hundred cubic centimeters occurred frequently without gastric retention. Concentrations of less than 3 Gm of albumin per hundred cubic centimeters never were observed. Regeneration of globulin was not rapid. Estimations of the concentration of serum protein, the two fractions and the colloidal osmotic pressure of 15 patients after operations on the stomach whose postoperative course was marred by postoperative gastric retention revealed that gastric retention was

associated with a concentration of serum protein within normal limits or within normal postoperative limits. Gastric retention was associated with a colloidal osmotic pressure well in excess of the "critical edema level" (160 to 200 mm of water). The amount of retention was not paralleled by fluctuations in the concentration of serum proteins or the albumin fraction of the colloidal osmotic pressure. Retention frequently diminished and disappeared with a coincidental decrease in serum osmotic pressure and in the concentration of serum proteins. Clinical edema caused by hypoproteinemia was noticed postoperatively at the same time at which gastric retention disappeared.

Observations on Treatment of Diabetes Mellitus—Olmsted believes that if the diabetic patient receives a diet which fulfils the caloric, mineral and vitamin requirements and if he is kept sugar free and the obese diabetic patient reduce, the premature development of arteriosclerosis will be prevented and the patient will live approximately as long as any one else. His experience with protamine zinc insulins which contain less protamine leads him to believe that they are better adapted to the treatment of the disease than the forms of protamine zinc insulin now in use. The success of the dietetic management of

the diabetic patient depends a great deal on dietetic education and simple methods. Use of the measuring cup results in better control of the diet than the use of the metric system in spite of its undoubted accuracy.

Wounds of Heart—Blegen thinks that in many hospitals the signs and symptoms of cardiac tamponade from injury is still unrecognized and that the patient presenting himself with the typical syndrome is often given up as beyond medical aid. Of 17 such patients admitted to St. Joseph Hospital during the last fourteen years 13 were Negroes and 4 were white. The wounds of 9 were due to gunshot of 5 to stabs and 2 to non-penetrating body blows. In 7 cardiac tamponade was proved at operation or necropsy. Four of these patients were operated on, 2 recovered. Five patients died in the emergency room before treatment could be given. Surgery was not offered to 6 in spite of the fact that they lived longer than one hour and 1 recovered with conservative measures alone. One of the 2 patients who had a cardiac injury proved at necropsy as the result of nonpenetrating body blows had a cardiac tamponade as a result of a rupture of the right auricle and lived five hours after admission. The other patient had a ruptured auricular endocardium which was not detected clinically but which would have been compatible with life had he not died from an accompanying gas bacillus infection. As cardiac rupture with tamponade following a body blow may be relieved surgically all patients especially those injured in automobile accidents who show signs of cardiovascular collapse out of proportion to blood loss or other injuries should be examined carefully for tamponade with the hope of saving some of them by early operation.

Nonspecific Therapy in Anterior Polymyositis—Stone used artificial fever and vitamins B and E as found in wheat germ oil in the treatment of the acute and subacute anterior polymyositis of 12 patients, 6 also received artificial fever. In none of the patients treated—all except 1 had paralysis of varying degrees of severity—did any deformities or contractures develop. Muscle tenderness was greatly diminished in all especially in those who received artificial fever and vitamin medication. The intravenous or intramuscular administration of thiamine hydrochloride during the acute stage appeared to exert a nonspecific beneficial influence on the patients' general condition and to lessen the severity of paresthesia. It was most effective when combined with artificial fever and given during the height of the fever. Vitamin E appeared to lessen the tendency to the development of fibrosis; increased muscle tone in chronic patients and possibly favorably influenced muscle regeneration when the nerve supply was not destroyed completely. Artificial fever therapy at 102 to 105 F was well tolerated by all patients. It helped to reduce muscle tenderness, relieved vasospasm and muscle spasm and improved the circulation of the spinal cord and brain by increasing the supply of oxygen to the central nervous system thus improving the nutrition of the neurons not already destroyed. When combined with vitamins B and E it rapidly improved the symptoms in patients with progressive fibrosis. While vitamins B and E and artificial fever are nonspecific in their mode of action they probably assist in the regeneration of the neurons partially affected by the virus, improve the patients' general condition and assist in preventing excessive fibrosis, a frequent cause of deformities and contractures.

Pulmonary Tuberculosis Complicated by Bronchial Tuberculosis—Examination of complications arising in the course of administration of pneumothorax in pulmonary tuberculosis complicated by bronchial tuberculosis reveals, according to Kottwitz and Shields, that atelectasis, amicrobial infection, progressive tuberculosis, tuberculous empyema and inextinguishable lung occur frequently. These complications are so serious that every effort should be made to diagnose bronchial tuberculosis before pneumothorax is instituted for parenchymal disease. Prognosis in general depends more on the severity of the bronchial disease (and particularly its management) than on the stage of the pulmonary disease. Therefore the maintenance of an efficient bronchial drainage is of primary importance. Serious complications are encountered most often with extensive bronchial disease and especially when the inflammation is acute. Pneumothorax is contraindicated with extensive ulceration or stenosis and with moderate progressive or stationary ulceration, particularly if secretions are retained. It is relatively safe with moderate or slight ulceration which tends to heal. As the serious complications which follow pneumothorax often do not do so after thoracoplasty, it is therefore the treatment of choice when collapse therapy is indicated but pneumothorax is contraindicated.

Thymus in Relation to Myasthenia Gravis—McEachern states that the general character of myasthenia gravis suggests an endocrine disorder. Tumor or hyperplasia of the thymus is found at necropsy in more than half the cases. Microscopic search for aberrant or exceptionally small nodules might increase the percentage. The tumors are almost invariably benign encapsulated adenomas. Hyperthyroidism, adrenal cortex deficiency and castration each have muscular asthenia, crumura and hypertrophy of the thymus in common. The symptoms of myasthenia gravis are almost identical with those of prolonged curare poisoning, and the underlying neuromuscular disturbance is in both instances a peripheral phenomenon. The beneficial effects of prostigmine and the aggravation of symptoms by curariform drugs suggest faulty chemical transmission at the myoneurial junction. Evidence favors the action of some curare-like substance. There is no convincing experimental evidence of an endocrine function for the thymus, although a number of observations are suggestive. Under clinical and experimental conditions the thymus undergoes hypertrophy during states of hyperthyroidism or hypofunction of the adrenal cortex or sex glands. Reverse conditions cause its involution. Since the thymus is largest at about the time of puberty and its weight in proportion to total body weight is greatest during the last months of fetal life and at birth, it might conceivably produce some substance which acts as a chemical brake to muscular activity, especially during fetal development. Roentgen evidence of thymic enlargement or tumor is rare in myasthenia gravis, although experience at necropsy leads to the anticipation of an abnormality of the organ in about half of the cases. Roentgen therapy directed to the thymus has yielded inconclusive results, although some patients seem to have benefited. Remissions and exacerbations of the disease in relation to pregnancy and to the alteration of the function of the thyroid are of great interest. The 13 patients with myasthenia gravis who had their thymus or thymic tumor removed and who survived appeared improved, the improvement in a few amounted to cure. Complete disappearance of myasthenic symptoms did not result in all cases despite apparently complete thymectomy. Experiments aimed to demonstrate a curare-like substance in the blood and urine of myasthenic patients and in extracts of thymic tumors removed at operation or necropsy revealed no such substance.

Niacin in Vincent's Infection—Johnson gave 25 to 50 mg of niacin three times a day to adults and 10 mg or more to children with Vincent's angina. The most spectacular results were obtained in the acute cases. A typical case is that of a 17 year old girl with ulcers of the pharynx, enlarged cervical lymph nodes and a temperature of 103 F. A smear showed numerous Vincent's organisms. Niacin in 25 mg doses three times daily resulted within forty eight hours in normal temperature and disappearance of ulcers. A smear taken on the fifth day was negative. The substance was found useful in the acute cases of gum involvement and helpful in chronic cases in conjunction with local treatment. Its use keeps the mouth cleaner and apparently greatly retards the formation of tartar. It has been of decided value in pyorrhea even when Vincent's organisms were not present.

Treatment of Superficial Fungous Infections—Peck and Schwartz differentiate fungous infections from the so called allergic manifestations to them. The infected organism may become sensitized to the fungi or their products. Blood stream dissemination gives rise to manifestations known as dermatophytids. Secondary manifestations of dermatophytosis cannot be properly treated unless the primary infection is eradicated. Hypersensitivity to the fungi may be so great that only a small focus between the toes or under a toenail may result in generalized infections that is dermatophytids. In the treatment of direct dermatophytosis ointments should be used in the groin or other areas where there may be maceration. A typical formula for such an ointment approximates about half strength Whitfield's ointment with the addition of thymol. Tinctures may be found more practical. Trichophyton rubrum infections are extremely resistant to treatment. A conservative method for fungous infections of nails consists in daily scraping of the nail with a file or with sandpaper and the application of an antiseptic ointment or tincture. In some instances x-ray treatment has proved beneficial. Mennick's solution boric acid

and Burrow's solution in the form of wet dressings are helpful in deep dermatophytosis of hairy areas. Trichophyton metaglyphic, the most common cause of dermatophytosis of the feet has a high sensitizing power. The most common form of dermatophytids associated with this fungous infection is manifested by vesicles along the sides of the toes. These have been called dysidrotic epidermophytids. In addition to the local treatment desensitization by injection of trichophyton must be attempted. The spread of fungous infections in shower rooms may be controlled by wearing individual slippers with wooden soles to and from and in the showers. These slippers can be sterilized once a week by placing them in 1 per cent sodinated solution of cresol or by steam sterilization. In the acute stage of dermatophytosis of the feet with vesicles, swelling, crusting and pustules and a great deal of weeping wet dressings are indicated. Foot baths with diluted sodinated solution of cresol, about 0.5 per cent solution taken two or three times a day for fifteen minutes are beneficial. Immersion in potassium permanganate 1:8000 hot, for fifteen minutes two or three times a day is also helpful. Foot powder can be used between the baths. In the presence of a high degree of sensitivity and in eruption which has spread to the rest of the body it is not advisable to treat the primary lesion too vigorously because the rapid killing of fungi and dissemination of their toxins may cause intensification of the allergic manifestations. In the treatment of the subacute form a keratolytic and an antiseptic are needed. In some cases x-ray or trichophyton injections may have to be used. Infected socks should be boiled or treated by placing them in 1 per cent sodinated solution of cresol allowed to soak overnight and washed in cold water. Dusting powders may be used in the shoes. The infected socks and shoes may be placed in a closed receptacle and exposed to the vapors of formaldehyde.

Knott Technic of Ultraviolet Blood Irradiation in Peritonitis.—In the last four years Mile and Rebbek irradiated the blood with ultraviolet to control the infection of 72 consecutive persons critically ill with peritonitis, 40 had generalized peritonitis, 20 appendical abscess with localized peritonitis and 12 multiple pelvic abscesses with severe pelvic peritonitis. In 43 the only therapy was the ultraviolet blood irradiation, and 29 were previously unsuccessfully treated with chemotherapy. The authors' technic of irradiating blood is that devised by Knott. The procedure consists in withdrawing and citrating a carefully predetermined amount of a patient's blood and immediately passing it through a hemoradiator, a machine that properly irradiates the citrated blood and returns it intravenously to the patient. The end result of ultraviolet blood irradiation in the 40 patients with generalized peritonitis was that 32 recovered, 100 per cent of the moderately advanced and 53 per cent of the apparently moribund. Seventeen of the 20 with localized peritonitis with appendical abscess recovered, 100 per cent of the moderately advanced and 57 per cent of the apparently moribund. Nine of the 12 with pelvic peritonitis and multiple pelvic abscesses recovered, 100 per cent of the moderately advanced and 67 per cent of the apparently moribund. The paralytic ileus, which had been present as long as four days in some, disappeared within twelve to ninety-six hours after ultraviolet blood radiation therapy. This disappearance and the reappearance of normal intestinal smooth muscle

tone was characterized by the expulsion of large amounts of flatus, a definite reduction in abdominal distention, normal abdominal auscultation and subsidence of other toxic symptoms. The optimal time for ultraviolet blood irradiation in all cases of peritonitis appears to be before operation, the sooner instituted the better.

Relation of Atrophic Gastric Mucosa to Gastric Carcinoma.—Jankelson and his associates found an incidence of 1 per cent of gastric cancer among 100 patients with pernicious anemia and an anticipated incidence of 4.4 per cent among 18 patients with atrophic gastritis. The actual or anticipated incidence of gastric cancer in the two groups was so high as to justify a conclusion that atrophy of the gastric mucosa predisposes to cancer. In the presence or absence of pernicious anemia, patients with atrophy of the gastric mucosa should be carefully observed lest an unsuspected gastric carcinoma develop. Repeated x-ray examination, gastroscopy and examination of the stool for occult blood should permit an early diagnosis of gastric polyps and carcinoma.

Diagnosis and Treatment of Carcinoma of Colon.—The symptomatology of carcinoma of the right and left colon differs because of the anatomic and physiologic differences of the two sides of this organ. Wilson points out that mild digestive disturbances, changes in bowel habits, weakness and anemia should prompt an investigation of the right side of the colon. Chemical analysis is usually necessary to demonstrate blood from tumors on this side. Symptoms of acute, subacute or chronic obstruction are often the first evidences of a tumor of the left side of the colon. Progressive constipation occasionally replaced by an intermittent diarrhea is of common occurrence. Blood in the stool is apt to be present on gross examination. The diagnostic procedures in both instances should include history, digital examination of the rectum, stool analysis, proctoscopic examination and barium sulfate studies of the colon. A great deal of individualization of treatment is necessary in each case. The general physiology of the patient must be studied to ensure adequate levels of erythrocytes, plasma proteins, chlorides, water and protective vitamins. If obstruction exists it must be relieved by proximal decompression before the tumor is extirpated.

Treatment of Cerebral Contusion—Rogers presents evidence which indicates that the brain reacts to cerebral contusion by attempting to increase its volume. No two head injuries are exactly comparable. Remarkable and complete recoveries often follow extensive injuries to the skull and brain. The absence of sequelae following the consistent application of any particular therapy may be urged in its favor. Dehydration is a method which permits cerebral swelling to take place after injury. It should be effected by rectal administration of magnesium sulfate and not by intravenous methods, which probably cause undesirable reactions. A smooth convalescence and no sequelae have followed treatment of a large series of cases by continued gentle dehydration. Often the postconcussional state may result from the failure to introduce effective treatment in the early stages and it may represent a condition of unresolved contusion. It is believed that a resolution takes place readily and completely if the requisite condition for reparation is provided. This is the provision of space so that cerebral swelling can occur and is not restricted by the cerebrospinal envelops, with consequent impairment of the cerebral blood supply. Provision for such swelling is made by sustained dehydration which reduces the incompressible water content of the skull.

The Rheumatic Child—According to Hubble the rheumatic state in childhood has two main components—nervous excitability and infection. These are present in varying degree so that it may be impossible in one child to distinguish any nervous instability or in another to detect any evidence of infection. In one, the profound motor and emotional instability may be predominant and infection be either absent or a late invader while in another infection dominates the picture at the onset and throughout its subsequent course. Growing pains usually result because of some difficulty attending the growth of the personality, not of stature, and it is easier to find evidence of nervous instability than of infection in the subacute rheumatic state. The nervous instability of the rheumatic child has no relation to neurosis; it is a quantitative increase in emotion and kinesis. The relationship between nervous excitability and infection is difficult to determine. It has been generally assumed that such nervous instability in a rheumatic child is the direct result of the rheumatic infection or toxemia. This view is supported by the fact that chorea may develop for the first time during an attack of acute rheumatism. There is more evidence to support the contrary view that this nervous excitability commonly precedes infection and probably even prepares the ground for the rheumatic invader. The various etiologic factors in the rheumatic state are potent as far as they predispose to nervous excitability and infection. The heritable factor cannot be of great importance as there are many facts that declare it primarily as an environmental disorder. The health of the rheumatic child is improved and stabilized by treating its nervous instability. This is done by the removal of the grosser environmental stresses if possible by the adjustment of the child's reaction to its environment and, most important by continuous sedation with phenobarbital.

Multiple Primary Cancers of Uterus—The instance of multiple primary cancer of the uterus that Malphrant cites fulfilled the criteria for such a diagnosis: the cancers possessed distinct microscopic characters; different sites of involvement and complete independence. The entire corporeal endometrium of the author's patient was involved in a diffuse type of adenocarcinoma, while in the cervical canal there was an exophytic squamous cell carcinoma growing from its anterior wall. The demarcation of the tumors was clear, and any suggestion of transition from one to the other could not be detected.

Orchiectomy in Cancer of Prostate—Lane reports that, following orchiectomy, 23 patients with carcinoma of the prostate obtained almost immediate and complete relief from severe pain due to metastasis. His observations extend over six months. In many instances the consistency and mobility of the prostate were apparently restored to normal or much improved. The general health was commonly benefited. Estimations of the blood acid phosphatase ranged from 23 to 77.5 units per hundred cubic centimeters in cases in which there was x-ray evidence of bone metastasis. In all cases there was urinary retention which was relieved by a Thompson punch resection. Postorchiectomy estimation of the blood phosphatase is likely to prove useful in the management of these cases. Huggins and his colleagues suggest that if the acid phosphatase of the serum does not reach a low level after castration androgens are presumably being produced outside the testis; this is an indication for estrogen therapy.

Erythropoiesis in Scurvy—Israels describes the changes in the bone marrow in 3 cases of scurvy and anemia before and after treatment with ascorbic acid. In 2 there was evidence of diminished erythropoiesis and in 1 erythropoiesis was not significantly abnormal. After treatment with a corbic acid erythropoiesis of the bone marrow was increased in all cases. The anemia also improved rapidly without any specific anti-anemic treatment. Ascorbic acid deficiency seems to be more a depression of erythropoiesis than a failure of maturation. The present shortage of a corbic acid in the diet may eventually lead

to depression of erythropoiesis and consequent anemia should be borne in mind especially under present conditions of dietary restriction. The increased incidence of anemia particularly among pregnant women because of an inadequacy of iron in the diet has been suggested as the cause. Also a diet deficient in ascorbic acid may well be a contributory cause of this anemia. Ascorbic acid should be given to any patient whose anemia does not respond satisfactorily to iron.

Sulfazalazopyridine in Ulcerative Colitis—Santa experimented with a new sulfonamide compound, sulfazalazopyridine, which had been found effective in polyarthritis. She reports the effects of sulfazalazopyridine in 5 cases of ulcerative colitis. Sulfazalazopyridine appears to be the best available medication against ulcerative colitis. Two tablets of 0.5 Gm. each were given from four to six times daily. After the symptoms of ulcerative colitis subsided the treatment was continued in gradually decreasing doses for approximately a month. Administration of the drug is fairly frequently accompanied by fever and rashes while other complications are rare. Investigations revealed that the sulfapyridine constituent is the cause of skin eruptions. Skin tests are of no value in the detection of hypersensitivity to either sulfazalazopyridine or sulfapyridine. Patients who have given negative cutaneous reactions exhibited signs of hypersensitivity. An immunopyridine, a substance which probably forms in the organism as the result of the cleavage of sulfapyridine, gives a positive cutaneous reaction in patients who have had an exanthem after medication with sulfazalazopyridine.

Clinical Observation on Lambliasis—Diezfeld reviews the symptomatology of lambliasis on the basis of 16 cases observed at the medical clinic of Einsiedeln. The condition was formerly regarded as rare and harmless. The use of the duodenal tube has demonstrated that it is comparatively frequent. The effects of lambliasis are not limited to the intestine and the biliary system; the toxins of lamblia organisms may act on the nervous system and may cause grave changes in the general condition. In the presence of clinical pictures with obscure etiology, lamblia should be systematically searched for. Acridine dye preparations, such as atabine or acranil, permit a "therapia sterilisans magna."

Hepatogenic Osteodystrophies. G. Mayor — p. 1042

Hepatogenic Osteodystrophies—Leuiche and Jung called attention to the faulty union of fractures in subjects with hepatic lesions, particularly with biliary fistulas. Systematic study of hepatic disorders, such as cirrhoses and hepatic or biliary cancer, and of severe hepatic disorders secondary to acute yellow atrophy or to a hemorrhagic cholangitis demonstrated that these disorders are constantly accompanied by osseous lesions. Mayor confirmed these observations in experiments on rats and dogs. The polymorphism of bony alterations in persons with grave

hepatic disorders does not permit the conclusion that the skeletal defects are secondary to loss of bile. Serologic analyses demonstrate that disease of the liver brings about a complex disturbance of the metabolism, of a number of elements essential to the development of the organism. Taken individually, these manifestations do not explain the bony disturbances, their combination, however, seems sufficient to explain those which the author classifies as hepatogenous osteodystrophies. Disturbance in the fat metabolism in the case of insufficient biliary excretion is at the base of poor calcium assimilation, the fats being eliminated by the intestine in the form of calcareous soaps. A pathologic fat excretion leads to a loss of calcium. Biliary salts play the role of a co-ferment with regard to the pancreatic lipase and increase the hydrolytic power of the pancreatic juice toward neutral fats. Bile contains substances indispensable to the breaking down of soaps and fatty acids. Insufficiency of biliary excretion leads to faulty fat absorption. Steatorrhea and faulty calcium absorption which it involves have been known for a long time. The author discusses disturbances in the vitamin D and A metabolisms and the involvement of the parathyroids, and the hypophysis in hepatic disorders. Hepatogenic bone lesions should be classified with the endogenous types of osteodystrophies of visceral character similar to the renal and pancreatic osteodystrophies.

Archivos Argentinos De Pediatría, Buenos Aires

18 327-420 (Oct.) 1942

Sudden Death in Early Infancy. J. M. Albores — p. 365

Cerebral Hemorrhages in the Newborn—The Halacs collected cases of cerebral hemorrhage in the newborn in the institute of maternity in Cordoba during the last four years from a total number of 5,812 deliveries. They found that children of primiparas die of cerebral hemorrhage more often than do those of multiparas, the percentages being 1.27 and 0.85 respectively. Abnormal presentations and obstetric manipulations are likely to cause cerebral hemorrhage. The authors observed the following mortality rates in the different presentations: vertex 0.59 per cent, brow 3.33 per cent, face 7.4 per cent, pelvic 6.6 per cent. This suggests that an abnormal presentation is to be converted into a less dangerous one. Narrow pelvis and other obstacles to delivery involve dangers for the fetus if they are not discovered until after delivery has begun. Efforts should therefore be made to diagnose them early. Dystocia caused by abnormal uterine dynamics may have a traumatizing effect on the fetus. Use of substances capable of counteracting these dystocias will remove factors likely to elicit cerebral hemorrhage in the fetus. Correct selection of the obstetric intervention and the careful execution are of great importance, cerebral hemorrhages were present in 5.86 per cent of the children delivered with forceps, in 11.22 per cent of those delivered by internal rotation and extraction and in 7.68 per cent of those delivered by cesarean section. Syphilis and toxemia of pregnancy may cause changes in the tissues of the fetus. Their early detection and treatment will reduce the percentage of infants with cerebral hemorrhage. Women with menstrual disturbances have a high rate of artificial deliveries of infants who die of cerebral hemorrhage. If a child is born with any of the aforementioned antecedents and manifest asphyxia, resuscitation measures should be carried out cautiously and cerebral hemorrhage should be thought of. Immediate and prolonged immobilization (fifteen to twenty days) is indicated. Ice should be applied to the head, vitamins C and K and coagulating substances should be administered. At the author's clinic in Cordoba vitamin K is injected routinely into all parturient women in whom prolonged labor or obstetric manipulation seem likely.

Book Notices

Fractures of the Jaws and Other Facial Bones By Glenn Major DDS MD FACS With Chapters on Radiographic Technique by Lester M J Freedman BS MD Acting Director Department of Radiation Therapy the Western Pennsylvania Hospital Pittsburgh and War Aspects of Jaw Fractures by Arthur Diek DDS MD Major Medical Corps Army of the United States Cloth Price \$7.50 Pp 446 with 225 Illustrations St Louis C V Mosby Company 1943

This textbook is of interest and value to the physician the surgeon and the dental surgeon. This is particularly true now that large numbers of civilian doctors are joining military and naval services. They must be acquainted with the pathology and basic surgical principles involved in the management of these fractures. The text is easily readable by the general practitioner. It presents the essential basic facts pertinent to the subject which make it valuable to the surgeon and to the dentist who has not enjoyed a special training in oral surgery.

Chapters on diagnosis the mechanics of displacement of the fragments emergency collateral treatment and the general principles of the reduction and fixation of fractured segments cover the subjects adequately and simply. The various types of reduction and fixation generally employed in fractures of the mandible and maxilla are clearly and adequately described and well illustrated with drawings by the author. These principles and methods are applied to special fractures in the following chapters. These present the fundamentals essential to the management of the variously located sites of fracture and the numerous combinations of circumstances presented in both dentulous and edentulous jaws. Fractures of the malar compound are discussed similarly. The management of nasal fractures is discussed too generally and too briefly. This type of fracture is not well handled in civilian practice as a rule and this occasions much subsequent surgery which could be avoided. The mechanical devices described are rarely essential to a good result. Postoperative care diet and complications are sufficiently discussed. Chapters on radiographic technique and the war aspects of fracture casualties will be helpful to the military surgeon.

A good index and generous subheadings throughout the text make the subject matter readily accessible. The volume should be in the hands of every practitioner.

Speaking of Man A Biologist Looks at Man By Michael F Guyer Professor of Zoology University of Wisconsin Madison Cloth Price \$3.50 Pp 321 New York & London Harper & Brothers 1942

This book is a rather uneven combination of scientific facts for the layman biologic interpretations of human behavior common sense observations about everything and poetry. Professor Guyer is at his best in his exposition of the value of science and in his lucid and interesting presentation of the findings of astronomy chemistry biology and psychology. The book would have gained in consistency and power if it had been confined to the definition of scientific method and to a summary of scientific knowledge. The biologic interpretations of behavior are inadequate and one-sided since the author does not integrate them with the points of view of social psychology and anthropology of which he shows little or no knowledge. His observations on human conduct are wise and witty but are often unrelated to his scientific facts and biologic point of view. They seem frequently to arise more out of his experiences as a person in our American culture than out of his experiments in the laboratory. This is almost inevitable when a specialist attempts to apply his knowledge gained in one small field to the whole area of human behavior including sex education democracy and international relations. Many readers will be uplifted by the quoted poetry and Professor Guyer's own prose poetry.

Obstrucción del colédoco y decompresión del sistema biliar obstruido. Estudio de cirugía experimental consideraciones clínico quirúrgicas. Por el Dr. Abel N. Canónico Tesis de doctorado Universidad Nacional de Buenos Aires Facultad de ciencias médicas Escuela de medicina Paper 1 p 149 with 66 illustrations Buenos Aires 1938

A good experimental study of the lesions induced by bile duct obstruction. The black and white and colored illustrations are as good as those seen in first class textbooks if not better. Since comprehensive summaries in English French and German are appended and the publication is available for exchange we can dispense with an analysis of the author's conclusions.

Clinical Laboratory Diagnosis By Samuel A Levinson MS MD Director of Laboratories and Pathologist, Research and Educational Hospitals Chicago and Robert P MacFate ChE MS PhD Assistant Director of Laboratories Research and Educational Hospitals Second edition Cloth Price \$10 Pp 980 with 171 illustrations Philadelphia Lea & Febiger 1943

The second edition of this excellent book has been thoroughly revised and brought up to date. New methods have been added where experience has shown them to be of value. Old methods which have proved of little worth in the light of recent investigations have been deleted. The latest interpretations of clinical laboratory findings and many new items have been included. There are sufficient illustrations, including several colored plates of skin reactions. The first edition proved its general usefulness. As a textbook for students in clinical pathology it served as a guide for general laboratory technique and as the basis for well recognized interpretations of laboratory findings. Detailed discussions were limited to matters not previously covered in the general medical curriculum. Reference was made to a few pertinent items from previous studies to serve as a reminder of all the work that had gone before. Most of the controversial points were reserved for the lecture room. The intern and the practicing physician have found the book of value in the interpretation of laboratory findings and as an aid in the study of cases requiring laboratory work. In the clinical laboratories or the average hospital it serves as a quick ready aid. The method of presenting the various laboratory techniques in simple and concise terms has served to meet the needs of the laboratory technician from the inexperienced beginner to the highly trained medical technologist and clinical pathologist.

Additions to the second edition include discussions of water metabolism acid base balance bone marrow findings, blood volume the Rh factor, prothrombin and many other items which have become more important in the past few years. The chapter on blood chemical methods has been brought up to date and methods for the photometer have been added. This section should prove of great value to the clinical laboratory, because methods have been modified so that the same reagents are used whether the product is to be read in the colorimeter or in the photometer. At all times but especially in the present emergency clinical laboratories are faced with the problem of performing tests when the apparatus used needs repair. The colorimetric determinations here presented may be converted from the photometer to the colorimeter or the reverse with but slight changes in technique and with no loss of time for the preparation of new reagents. Thus continuation of the normal routine may be effected when either the photometer or the colorimeter requires repair. Among the new blood chemical methods described are ascorbic acid, acid and alkaline phosphatase, amylase, bromine and sulfonamide compounds. The comprehensive tables of normal and abnormal findings have been revised. The latest approved changes in the Kolmer complement fixation test the Kahn test and other serodiagnostics tests have been added. The chapter on general bacteriology has been completely revised with the addition of detailed technique for the initial isolation and final identification of all the common bacteria. The comprehensive tables of the characteristics of the more common bacteria have been revised. Two excellent color plates of bacteria have been added. Bergey's latest nomenclature and classification have been followed throughout. Extensive revisions have also been made in the chapters on sputum pediatric procedures histologic technique and legal medicine.

The systematic arrangement of the book follows that of the first edition. Extensive use has been made of charts and tables which are especially valuable. The outline of the course in clinical pathology which appeared in the first edition has been deleted to allow more room for recent important tests. Aided from this deletion more than a hundred and sixty pages of text have been added. The book is unique in its comprehensiveness without any sacrifice in clarity of subject matter. Its usefulness has been proved and it has been accepted as a standard work on clinical laboratory diagnosis. The book is unqualifiably recommended to technicians students clinical pathologists and physicians.

The Sight Saver By C. J. Gerling. Cloth. Price, \$2. Pp. 202. New York: Harvest House, 1941.

The author is not a physician and is known to the reviewer as author of this book and another, "The Complete Weight Reducer." This book is written to acquaint laymen with the essential facts about the eyes and to warn them against the methods employed by quacks. It seems admirably conceived for this purpose. The facts about the eye and its functions are given in concise paragraphs, arranged alphabetically, with cross references to other related sections. It is debatable whether this arrangement is conducive to pleasant reading, but it does allow a reader to find easily the information available on any subject. The information was obtained from a number of books and pamphlets both medical and popular, which are listed and seem to have been well selected. Being written by a layman, the language is such as to be easily understood by laymen.

The author represents consistently the views held by most ophthalmologists. One might point to instances of undue optimism concerning the effects of treatment in certain diseases and to an unduly pessimistic attitude toward the result of surgery in strabismus. On the whole, however, the information is such as any ophthalmologist would be glad to place in the hands of his patients.

At this time, when popular enthusiasm has been kindled by Huxley's book on the Bates method of correcting eye defects by exercise, it is worth quoting part of what the author has to say about Dr. Bates and his methods. "Though a graduate of a recognized medical school, Bates enjoys the dubious honor of being the patron saint of the multitude of charlatans who prey upon persons whose vanity or convenience brought them to seek to escape the need for wearing glasses. Under Quackery and Fraud, the author goes further into this matter and into other forms of deception which have such a strong appeal to those with certain infirmities. Various well advertised eye drops are described with advice that boric acid solution or isotonic solution of sodium chloride is as good when a cleansing solution is required. Patients are cautioned against self medication and against a number of heresy aids for use about the eyes.

The functions of the eye physician, optometrist and optician are well defined, and the advantages of examination by the physician are stressed. The section on the price of glasses is a fair discussion of this touchy subject.

The Mind and Its Disorders By James N. Brawner, M.D., Medical Superintendent, Brawners Sanitarium, Smyrna, Georgia. Cloth. Price, \$3.50. Pp. 224 with 7 illustrations. Atlanta: Walter W. Brown Publishing Company, 1942.

The author, superintendent of a sanatorium, purports to describe briefly and in simple language the neuroses, psychoneuroses and psychoses, writing especially for the general practitioner. Part I is a brief account of the mind as related to cerebral structures and functions. Included here are such subjects as feelings and emotions, intelligence, memory, excitation and inhibition, and the electroencephalogram. No attempt is made to give an adequate account of these fundamental subjects, and the psychological approach is essentially that of the old "faculty" school. The diagrams illustrating cerebral structures are poorly labeled and give a confused impression of brain centers and their function. Part II is an account of the etiology, symptoms and treatment of the psychoses. Here the psychoses are defined as "disordered intellectual or emotional reactions due to defective heredity, acquired diseases, environmental experiences" or their combinations. Obviously this definition makes no distinction between defects, such as simple schizophrenia, dementia, which may occur without psychosis, psychoneuroses, in which the stress is between the patient and his environment, and the psychoses, in which the stress is primarily within the body. This section of the book is quite complete topically, and the author is to be commended for stressing the view that the subject matter of psychiatry is closely related to internal medicine. The modern shock treatments are described and recommended. Part III is a description of the neuroses and psychoneuroses, the former being regarded as an "abnormal nervous reaction, involving principally the vegetative and lower cerebrospinal mechanisms, while the psychoneuroses involve to a limited extent the mental processes." Suggested treatment is essentially that of diet, hydrotherapy and recreation. Little

attention is given to the need for analysis of the highly important psychological factors in many of these disturbances. Part IV includes a number of related subjects. The book gives a rapid review of mental disorders, and, despite shortcomings which limit its interest to the trained psychiatrist, it should prove of value to the general practitioner as an aid to his understanding of mental disorders.

Pancreatic Function and Pancreatic Disease Studied by Means of Secretin By Henrik O. Lagerlof, M.D. Translated by Helen D. Frey. With a foreword by Joseph H. Pratt, M.D. Cloth. Price, \$3.50. Pp. 289 with 10 illustrations. New York: Macmillan Company, 1942.

In his foreword to this monograph, Dr. Pratt summarizes its import by saying that the work reported by Lagerlof has lifted pancreatic analysis to the level gastric analysis has occupied for many years. Almost half of the volume is concerned with a historical survey of research on the physiology of the pancreas and a description and critique of methods for the analysis of the pancreatic enzymes. There follows a relatively brief section on the secretin test as used by the author and his collaborators, and the results obtained with it on normal individuals and on patients suffering from pancreatic disease. The remaining approximately one third of the book is devoted to summarized case histories of 37 patients with proved diseases of the pancreas and of 26 patients with suspected pancreatic disease. An appendix contains tabular data illustrating the author's experimental work and summarizing control tests on normal subjects. A bibliography of 358 references is also included. This book is a useful reference work for physiologists and for students of gastroenterology. The practical considerations of immediate interest and use to the general practitioner might well have been set forth in a pamphlet only a fraction of its size.

Noxious Gases and the Principles of Respiration Influencing Their Action By Vandell Henderson and Howard W. Haggard. American Chemical Society Monograph Series. Second edition. Cloth. Price, \$3.50. Pp. 291 with 12 illustrations. New York: Reinhold Publishing Corporation, 1943.

This book is another in the American Chemical Society's Series of Scientific and Technologic Monographs. According to the authors it is written for the practical use and information of chemists, engineers and others engaged in industry. As far as the medical profession is concerned, the book will be of value to industrial physicians and lecturers on industrial medicine. It does not seem suitable for students except as a reference source. Included in the contents are chapters covering a general survey of the field, elements of respiration, the respiratory functions of the blood and their laws and practical applications of the laws of gases and vapors. Of special interest are the chapters offering discussions on the principles determining absorption, distribution and elimination of volatile substances and classification and descriptions of noxious gases and vapors. Supplementing this information are practical statements on methods of resuscitation, first aid and prevention of poisoning by noxious gases.

Técnica e Indicaciones de la transfusión en el niño pequeño Por Guillerio Federico Thomas. Tesís, Universidad nacional de Buenos Aires. Facultad de ciencias médicas. Escuela de medicina. Paper. Pp. 68, with 20 illustrations. Buenos Aires, 1942.

In this study the author advises the use of peripheral veins for blood transfusions in little children and infants and gives useful data concerning the indications of the method.

Big Little Things in Conquering Pulmonary Tuberculosis By Samuel H. Watson, M.D., and W. R. Hewitt, M.D. Second edition. Paper. Price, 10 cents. Pp. 28. Tucson, Ariz.: Tucson Clinic, 1943.

This pamphlet is devised for patients with pulmonary tuberculosis who must become adjusted to an entirely new routine of life. It answers the common questions of patients in a straightforward and common sense manner. It can be safely recommended to all patients who have learned of their tuberculosis for the first time.

El nistagmus postoperatorio en neurocirugía Por el Dr. Fermín J. Barcala. Tesís de doctorado, Universidad nacional de Buenos Aires. Facultad de ciencias médicas. Paper. Pp. 68. Buenos Aires: Adolfo López, 1942.

A study of nystagmus developing after craniectomy, of which the etiology is unknown but the disappearance of which seems to parallel the disappearance of cerebral edema.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

TESTING AND RECORDING VISUAL ACUITY

To the Editor—What is considered standard in testing distant and near vision is 20 feet standard for distant vision? Is 14 inches standard for near vision? If a photometer when placed in the same position as the examinee's eyes reads 25 foot candles is that considered standard? If you are unable to answer this in terms of standard, how would you answer it in terms of recommendations? MD New Jersey

ANSWER—It is impossible to apply the term standard to the testing and recording of visual acuity. It is not the distance between the patient and the test chart that is the deciding factor, but the angle that letters of a given size produce on the retina. Snellen, who introduced the present method of recording, utilized 20 feet because that was the most feasible under his working conditions. Ophthalmologists refract at 20, 30 or 40 feet or at 6 or 10 meters according to the available space. Test charts are graded accordingly and the results are recorded by a ratio, of which the working distance is the numerator. Thus 20/20 corresponds to 30/30, 40/40, 6/6 or 10/10. Thus the available working distance is the determining factor, and, when that has been decided on, test charts should vary so that the angular size of the letters corresponds or the ratio of the charts used should be transposed.

Fourteen inches was adopted as the average reading distance by the Committee on Compensation for Visual Injury, and the near chart was so constructed that the letters on that chart subtended an angle of 5 minutes on the retina. The reader is referred to the report of this committee, which appeared in THE JOURNAL, July 11, 1925, page 113.

The photometer reading should be at the test chart and not at the patient's eye. At that point the intensity of illumination must be not less than 10 foot candles nor more than 25.

PAINFUL RECURRENT ULCERS OF MOUTH

To the Editor—A white woman aged 60 complains of recurrent ulcers of the mouth first beginning with the menopause. They are flat, irregular, shallow ulcers with a purulent base and are associated with excruciating pain recurring from two to four times a year. They are slow to heal. She has been thoroughly studied by a number of competent physicians with no significant positive findings. Her general condition is excellent. Do similar conditions occur as a result of endocrine dysfunction? Kindly suggest methods of treatment or prevention. MD District of Columbia

ANSWER—The ulcerative stomatitis which has been briefly described fits with the diagnosis of periadenitis mucosa necrotica recurrens. This is a familial condition said to be endocrine in origin, occurring in older women. The description of the ulcers with pain is typical and their tendency to recur is noted in the name. None of the treatments proposed have proved consistently successful.

Local treatment with alum, and the use of solution of potassium arsenite internally have been recommended. A trial of ovarian substance (theelin) by injection or orally would be worth while.

Simple ulcerative stomatitis in general is rare in good health and may suggest an early dietary deficiency, especially if the oral hygiene and condition of the teeth are good.

Potassium chlorate 0.65 Gm three times a day is said to be effective.

Fusospirochetal ulcers may be recurrent and may offer little in the way of definite bacterial flora except on repeated examination. The use of neocarphenamine in glycerin (10 per cent) alternating with sodium perborate packs would be worth a trial if this condition seems probable.

TREATMENT OF INTERNAL HEMORRHOIDS

To the Editor—Will you please inform me as to the status of electrocoagulation in the treatment of internal hemorrhoids? Is it an accepted procedure? Louis B. Sternberg MD Shelbyville Ky

ANSWER—As far as is known electrocoagulation is not used extensively in the treatment of internal hemorrhoids. Doctors who treat internal hemorrhoids are more likely to use an injection of carbolic acid solution or quinine and urea hydrochloride. The technique for these injections and the strength of the solution

can be found in any textbook of surgery. Either of the methods, electrocoagulation or injection of irritating solutions, causes thromboses in the veins of the internal hemorrhoids which later result in fibrosis and some shrinking of the hemorrhoids. The difficulty with the whole procedure is that any other lesion such as polyps, fissures or external hemorrhoids covered by skin are not amenable to treatment. Therefore only a limited number of patients should be treated in this manner and those with careful selection. If these precautions are neglected, patients frequently are made worse by injections or electrocoagulation and suffer from ulceration, hemorrhage or abscess formation. In addition, most dilated veins causing hemorrhoids are present under the skin as well as under the mucosa, and the veins under both areas anastomose freely with one another. If only one group is treated leaving the other, recurrence is almost inevitable. This means that the treatment of internal hemorrhoids by electrocoagulation or injection treatment is probably but a palliative measure in most instances.

GNOCOCCI AND OTHER ORGANISMS GIVING POSITIVE OXIDASE REACTION

To the Editor—With regard to culturing gonococci on chocolate blood agar medium I should appreciate information on organisms other than gonococci that give oxidase reactions that would be likely to be normal inhabitants of the vaginal tract. Also may I have information concerning the gram staining properties as well as the general morphology of these organisms if any? I am also interested as to the sugar fermentation reactions of any organisms that might be confused with gonococci when using the oxidase method of detection of gonococcus colonies by culture method. Albert R. Cameron MD Wilmington N C

ANSWER—When J. W. McLeod (*J Path & Bact* 31:185, 1928) introduced the use of the oxidase test for rapid identification of the gonococcus, he gave a list of other organisms which were oxidase positive. Those which have been encountered occasionally in the genitourinary tract are other *Neisseria* (*catarrhalis*, *flava* and *sicca*), *Hemophilus*, certain yeasts, some varieties of the coliform bacillus and *Bacillus subtilis* and *Streptothrix*, which occasionally occur as contaminants. Organisms which have not been completely identified have also been reported. McLeod (*ibid* 39:221 [July] 1934) and Price (*Brit M J* 1:199 [Feb 2] 1929) small gram-negative diplococci, Luther Thompson (*J Bact* 31:82 [Jan] 1936) a gram-negative diplobacillus Weiss and Calvin (*South M J* 34:1102 [Nov] 1941) a gram-positive bacillus.

Less than 2 per cent of the positive reactions are due to these organisms and many of them can be differentiated on the basis of morphology alone. The others can be ruled out by fermentation reactions.

McLeod (*J Path & Bact* 39:221 [July] 1934) and certain other workers Thompson (*J Infect Dis* 61:129 [Sept-Oct] 1937) Spahr and Landy (*J Lab & Clin Med* 21:650 [March] 1936), Hac Hesselstine Adair and Hibbs (*Am J Obst & Gynec* 41:98 [Jan] 1941) have found the tetramethyl p-phenylene diamine hydrochloride preferable to the dimethyl compound for differentiation.

It must also be remembered that an occasional strain of gonococcus will fail to give a positive reaction to the oxidase test at least on primary isolation (Pitts A C *Am J Syph Gonorr & Ven Dis* 24:184 [March] 1940).

SNAKEBITE AND INTELLIGENCE

To the Editor—The bushmaster snake with neurotoxic venom is found in the jungles of eastern Peru. At a mission on the Perene River I saw a normal Indian who had recovered from the bite and who was said to be more intelligent than previously. This is the usual result. How does this compare with the use of snake venom in the treatment of insanity?

Roland Young MD Cosopolca Peru

ANSWER—Record has not been found in the scientific medical literature concerning the treatment of insanity with snake venom. One snake dealer has been treated for five different bites and his wife for seven bites. Since they continue to handle snakes after being bitten five and seven times respectively, this seems to offer conclusive proof that this venom has not given them any excess of intelligence. There is no evidence that the snake handlers in carnivals appear to possess superior mentality and horses which are used to make antivenum do not form an especially happy looking lot.

PELVIC MASS AND ABDOMINAL FISTULAS

To the Editor—A woman aged 27 was taken acutely ill about five months ago and had to be hospitalized at that time. A right lower quadrant incision was made and a pelvic mass found. Small intestinal loops which adhered to the mass were peeled off and the mass was drained. About three weeks after the first operation an incision on the left side was made for drainage of the mass. About three months after the first operation the pelvic mass was removed. A biopsy after the second operation indicated some kind of fungous disease. A culture of the pus taken out of the mass at the time of the third operation yielded *Leptothrix*. About one month after the third operation a foreign body 2.5 cm long at one end and 3 mm wide tapering to a point at the other end was expelled through a fistula. At present the patient is anemic. There are three fistula openings on the abdomen. There is a small mass in the left lower quadrant that causes pain. The general condition is poor. What should be done for the *Leptothrix* infection? Do you think that the expulsion of the foreign body which seemed to be wood, on Jan. 16, 1943 may still result in healing without further medication or intervention?

Alexander Strelinger, M.D., Elizabeth, N. J.

Answer—Because of the poor condition of the patient all aids must be employed to build up her resistance by prescribing a properly balanced diet and extra vitamin B complex and perhaps also by giving one or more blood transfusions. Roentgenograms both anteroposterior and lateral should be taken and a search made for additional foreign bodies. If none are found the treatment should be conservative because it is possible that after a while the fistulas may close spontaneously. If a foreign body is found in operation will most likely be necessary, but this should not be performed until the patient's condition is considerably improved. This may require many months. In some instances a foreign body becomes walled off by adhesions and no harm results from leaving it. Therefore every effort should be made to persist in conservative treatment but the patient's physical and mental condition must be bolstered up constantly.

FAT DEFICIENT DIETS

To the Editor—What are the first noticeable symptoms of fat deficiency in human beings? I have never seen any in this country, but if rationing becomes more strict we may see it here. While in Vienna I heard remarks that in World War I no fat was obtainable in Austria (and Germany?) and that that was the main reason why the armistice was signed in November 1918. I heard (in Vienna) that people at work or on the street would fall over exhausted and could not be revived unless given fat, this was given in the form of cream or butter in the early part of the war. Later on no fats were available and so nothing could be done for such people. The doctors there attributed this sudden exhaustion to starvation in general but primarily to lack of fats. I have never read anything along the line of fat deficiency in our medical literature, but of late I have been recalling what I heard in Vienna. Can you give me something authentic on this subject? Fats are needed for making glycerin, which is needed in making explosives so in the event of a long war we may have to face fat deficiency.

M.D., Wisconsin

Answer—The principal difficulty with the diet of people in Europe during the first world war was a lack of calories, resulting in severe loss of fat. The older people suffered from deficiency of thiamine and ascorbic acid and the children suffered from numerous vitamin and mineral deficiencies. Both children and adults had protein deficiency, as indicated by the development of "war edema." It is true that fats were low, but nobody as far as is known has produced a condition of fat deficiency in the human being. In general the diet ought to contain not less than 25 per cent of its calories in the form of fat and it is desirable that this fat contain some of the unsaturated fatty acids, such as linoleic acid, which is found in lard and many other common fats. There is some experimental evidence which indicates that there may be a need on the part of the human being for unsaturated fatty acids, but this need is supplied by the fats that are present in ordinary foods.

INSPISSATED MUCUS ON NASAL SEPTUM

To the Editor—A man aged 70 has a perforation of his nasal septum anteriorly, with the formation of a thin layer of jelly-like material in the area immediately behind. The material is removed with difficulty and recurs in one to two days. He has had tuberculosis, but it is quiescent, the Kahn reaction is negative. All specialists consulted have prescribed ointments which have proved ineffective. Have you any suggestions as to the cause and treatment?

M.D., Michigan

Answer—Since no mention is made of the presence of lesions on the turbinates or septum or of the presence or absence of an atrophic rhinitis one can only infer from the question that the condition described is simply one of inspissated mucus. No doubt there is a tendency to atrophy of the mucous membrane with consequent changes in the mucous glands. Tenacious secretion is quite common in such cases and will tend to accumulate and dry on the posterior margin of a perforation and the area just posterior. The treatment should be directed toward the

loosening of the "jelly-like material," which can be accomplished by douching with a warm solution of sodium bicarbonate and the application of a bland nonirritating ointment such as boric acid in equal parts of petrolatum and hydrous wool fat.

ACNE, FALLING HAIR AND MENSTRUAL IRREGULARITY IN YOUNG WOMAN

To the Editor—An unmarried woman aged 22 is the only child of a widow who shows her daughter more attention than is necessary. This girl has not worked to help support the home in the past four years, she spends a great deal of her time in bed and complains bitterly about her facial eruptions, a few acneiform pustules on the chin. She has few friends and seldom goes anywhere. She recently began to menstruate twice monthly, the flow lasting three to five days with dysmenorrhea throughout the flow. There are no clots and the flow is moderate. Menses began at 14 every twenty-eight days and were always normal. There is nothing abnormal in her past history either mentally or physically. The basal metabolic rate is minus 5. The blood pressure is 118/70, the pulse 100 and regular. The heart is essentially normal. Eyes, ears, nose and throat are all grossly normal. Knee kicks are slightly exaggerated and other superficial reflexes rather normal. The abdomen is tender on deep pressure in both lower quadrants. There is no rigidity and no palpable mass. The body weight fluctuates between 127 and 133 pounds (57.6-60 Kg). The body temperature is within normal limits. The height is 5 feet 2 inches (157 cm). Vaginal examination reveals no discharge. The hymen is intact. Rectal examination of the pelvic organs does not reveal more than tenderness in the area of each ovary. The breasts are of normal size and consistency. The areolae are normal except for a few enlarged Montgomery follicles. The patient complains that for the past few months her hair has been falling out and that her eyes are becoming smaller. I could agree with the first, but I am not sure about the second complaint.

M.D., New York

Answer—The only recorded objective disturbances in this case are slight acne, perhaps some loss of hair and too frequent and painful menstruation. Undoubtedly there is a large psychic factor which makes the patient emphasize unduly the few acneiform pustules, the falling out of the hair and the complaint about the eyes. Even though the treatment of all this patient's symptoms is generally unsatisfactory, an effort should be made to treat them. The treatment of the menstrual disorders is the most difficult. If the menses occur regularly every two weeks there need be no concern. It may be that real menstruation occurs every four weeks and that in the intervals between these menstrual flows the bleeding is associated with ovulation. This disturbance can be checked with endocrine therapy but the treatment is usually expensive and of only temporary benefit.

The patient is overweight, and thyroid medication may help some of her symptoms. In addition some form of suggestive therapy is definitely indicated. An effort should be made to have the patient get out and secure employment. Above all, some way should be found to bring her in contact with young men and women so that she may have a few close friends, especially among men. The situation should be explained to the patient's mother and her aid enlisted.

BENIGN EOSINOPHILIA OF UNKNOWN ORIGIN

To the Editor—A man aged 55, who was born in Spain, came to me with regard to a report of a 46 per cent eosinophilia in his blood for a great many years. This finding was accidental. There is no trace of physical impairment or loss of vigor and health. Blood Wassermann and Kahn reactions have been repeatedly negative. X-ray examinations of the chest and heart have given normal results. The urinalysis gave normal results. The skin and muscles are free from deep tumors. He has been hospitalized for further study of his condition, and all tests have been negative. There has never been any illness directly attributed to the eosinophilia. There has been no local swelling or swelling of extremities. Chyluria has never been observed. Special examination of the blood day and night for microfilaria has been negative. Could you give me a possible diagnosis of a case of this kind and also the prognosis? His last hemogram was hemoglobin 101 per cent (14.7 Gm), erythrocytes 5,090,000, leukocytes 19,150, color index 1. The differential was lymphocytes 22 per cent, eosinophils 46 per cent, basophils 0 per cent, mononuclears 1 per cent, polymorphonuclear neutrophils 31 per cent.

E. N. Boecanegra-Lopez, M.D., San Juan, Puerto Rico

Answer—There seem to be no clues in this case that would enable one to classify it among the known causes of eosinophilia. In some cases of trichinosis, eosinophilia has been reported to persist for years. A rather pronounced degree of benign eosinophilia has been observed in several members of a family (Stewart, S. G. Familial Eosinophilia, *Am J M Sc* 185:21 [Jan] 1933). A study of the patient's relatives would therefore be of interest. Even after painstaking study of some patients with eosinophilia, it may not be possible to determine the cause.

As long as the patient has no complaints or abnormal physical findings and the eosinophilia is of long standing, there is no reason why this condition should give him any trouble in the future. A yearly check-up on the blood count and differential is indicated.

ENDOMETRIOSIS

A STUDY OF ONE HUNDRED AND SEVENTEEN CASES
WITH SPECIAL REFERENCE TO CONSTRICTING
LESIONS OF THE RECTUM AND
SIGMOID COLON

E L JENKINSON, MD
AND
W H BROWN, MD
CHICAGO

Medical literature of the past two decades is replete with studies of most of the fundamental characteristics of endometriosis. The importance of this disease as a cause of constricting lesions of the rectum and sigmoid colon, however, has not been sufficiently stressed, nor is adequate roentgenologic information available. Correct preoperative diagnoses of this condition cannot be minimized. Constricting endometrial lesions of the rectum and sigmoid colon often are confused with carcinoma, and patients sometimes are subjected to radical resection of the bowel,¹ whereas castration usually will suffice. Many constricting endometrial lesions of the rectum and sigmoid often may be regarded as some other inflammatory or infectious condition and receive medical management with little or no improvement.

PATHOLOGIC CHARACTERISTICS

The term "endometriosis" in this discussion designates islands of ectopic adenomatous tissue with histologic and functional characteristics similar to that of normal endometrium and located in the female pelvis outside the uterine wall and cavity. Implants on the peritoneal surface of the uterus have been included in this study. The term "adenoma" refers to islands of endometrial tissue within the myometrium.

Endometriosis of the sigmoid colon or rectum resembles endometrial lesions elsewhere. Implants usually occur on the serosal surface with subsequent involvement of the muscular coats. The mucosa only occasionally is invaded. An associated intense inflammatory reaction is always present. Endometriosis of the rectum and sigmoid colon usually is considered a benign lesion. Josefsson² and the Pattons³ were unable to find in medical literature an unquestionable case with development of carcinoma from endometriosis of the sigmoid colon. Brame⁴ reports a case of rectal carcinoma con-

comitant with stenosing rectosigmoidal endometrioma in the rectal wall. Jose and Hanson⁵ found a carcinoma of the sigmoid with endometrioma in the pelvic pouch and vaginal fornix simulating metastatic carcinomatous lesions of the regional lymphatic nodes. Nylander⁶ reports a spindle cell sarcoma of the rectum containing endometrial tissue. Schofield and Bacon⁷ cite cases reported by Seitz⁸ and Thomson⁹ in which a malignant condition had developed from endometriosis in the rectovaginal septum, and 1 reported by Lockyer¹⁰ presenting metastatic endometrial tissue in the lung.

The frequency of associated pelvic disorders is noteworthy. Of 118 cases of endometriosis Keene and Kimbrough¹¹ found that 93 had complicating pelvic disorders and more than half had uterine myomas. The combined series of Counseller¹² and Masson¹³ reveal associated pelvic disorders in 54.5 per cent of 884 cases of adenomyosis of the uterus and pelvic endometriosis.

INCIDENCE OF ENDOMETRIOSIS

The incidence of pelvic endometriosis has been demonstrated by Green-Armytage,¹⁴ who found endometriomas in 89 per cent of one thousand consecutive abdominal operations. Ten per cent of 342 cases presented microscopic evidence of endometriosis. Sampson¹⁵ found endometriosis in sixty-four of two hundred and ninety-six laparotomies (21.6 per cent). From several series¹⁶ he concluded that pelvic endometriosis occurs in 10 to 20 per cent of all women between 30 years of age and the menopause. Jones¹⁷ stated that about 5 per cent of women 40 years of age have fibroids.

complicated by endometriosis. Patients with endometriosis in the absence of fibroids are not included. The foregoing surveys indicate that endometriosis develops in approximately 15 per cent of all women during their active menstrual life.

DISTRIBUTION OF ENDOMETRIOSIS

The relative frequency of endometriosis involving the sigmoid colon and rectum found in a study of the clinical and operative records of 117 patients at St. Luke's Hospital from 1939 to 1941 inclusive is listed in table 1. In this table and throughout the discussion "endometriosis of the rectosigmoid" designates any endometrial lesion of the sigmoid colon, rectum or rectovaginal septum which by reason of its location, by various degrees of extension or because of the associated inflammatory reaction could encroach on the lumen of the bowel or constrict this portion of the colon or rectum.

Endometriosis of the rectosigmoid was found in 17 of 117 cases. Allen¹⁸ found endometriosis of the bowel and rectovaginal septum in 11 of his 112 patients.

TABLE 1—Relative Frequency of Endometrial Lesions in One Hundred and Seventeen Cases

Ovary	83
Rectosigmoid	17
Extension of surface of fallopian tubes and broad ligaments	12
Peritoneum of cul-de-sac (not involving other structures)	11
Uterus and ligament	10
Peritoneal surface of uterus	1
Peritoneal surface of urinary bladder	16
Intraperitoneal round ligament	0
Umbilicus	0
Ligament of ovary	0
Appendix	2

TABLE 2—Relative Frequency of Rectosigmoid Endometriosis (Including Lesions of the Sigmoid, Rectum and Rectovaginal Septum)

	Series Total	Rectosigmoid	Per Cent
Allen ¹⁸	112	11	9.70
Cattell ¹⁹	104	17	16.0
Counseller ²⁰ and Mayo ²¹	162	51	31.0
Keene and Kimbrough ¹¹	118	6	5.0
Present series ²	117	17	14.0
Total	613	162	26.0

Cattell's¹⁹ series of 104 cases of endometriosis included 17 in which there was involvement of the sigmoid, rectum or rectovaginal septum. The combined series of Counseller¹⁹ and Masson¹⁴ include 884 cases of uterine adenomyosis and pelvic endometriosis, of which 162 showed pelvic endometriosis—exclusive of uterine adenomyosis. They found 120 ovarian lesions and 51 lesions of the sigmoid, rectum and rectovaginal septum. Keene and Kimbrough¹¹ in 118 cases list only 6 presenting involvement of the rectovaginal septum, a figure much lower than in most series reported. The relative frequency of rectosigmoid lesions in pelvic endometriosis is summarized in table 2.

About 25 per cent of all women with pelvic endometriosis have lesions of the rectosigmoid. By combining this figure with the previous estimate that approximately 15 per cent of all women develop endometriosis, it may be concluded that from 2 to 4 per cent of all women at some time during their active menstrual life may develop endometriosis of the sigmoid, rectum or rectovaginal septum. At this site it is a potential

factor in causing a constricting or obstructing lesion of the colon and rectum. Endometriosis of the rectosigmoid is important, therefore, in the etiology of constricting lesions of the rectosigmoid, especially in women during their active menstrual life.

INCIDENCE OF OBSTRUCTING ENDOMETRIOSIS OF THE RECTOSIGMOID

An accurate determination of the incidence of obstructing endometriosis of the rectosigmoid is difficult. Many lesions of the rectosigmoid have insufficient involvement of the bowel to produce constriction. The degree of obstruction is probably roughly proportional to the duration of the lesion while under active hormonal influence of the ovaries. Some patients reach the menopause before a constricting lesion can develop. Others are castrated because of an associated pelvic disorder.

A review of the medical literature since 1931 reveals numerous reports of partial or complete obstruction of the rectum or sigmoid colon caused by endometriosis.¹ Other reports—discuss variable degrees of rectosigmoid involvement. Only a few series giving the incidence of obstructing endometriosis of the rectosigmoid were found. Cattell¹⁹ found that 12 of 17 patients with lesions of the sigmoid or rectum had some degree of obstruction. Of Mayo and Miller's²¹ 38 patients with involvement of the rectum and sigmoid colon 18 had a proctoscopic examination and 15 showed a narrowed bowel lumen. Of the 47 patients with rectosigmoid endometriosis found in the present series, 21 had symptoms indicating some degree of obstruction. Table 3 represents a summary of these series.

Almost half of all endometrial lesions of the rectum or sigmoid colon cause a degree of constriction sufficient to produce symptoms at some time during active menstrual life. This estimate, of course, is subject to the inaccuracies of pyramided statistics. That these lesions are more frequent than usually considered may be explained by the fact that rectosigmoid lesions and bowel symptoms so often are subordinate to the other symptoms of endometriosis and associated pelvic disorders. When the true diagnosis is overlooked, relief may be obtained by the menopause.

CLINICAL CHARACTERISTICS OF CONSTRICTING ENDOMETRIOSIS OF THE RECTOSIGMOID

Endometriosis of the rectosigmoid is characterized by symptoms similar to other forms of pelvic endometriosis and by gastrointestinal complaints which

20 Counseller, V. S. Personal communication to the authors.

depend on the duration of the lesion and the presence or absence of a constriction.

In the reported series of 117 patients with pelvic endometriosis the youngest was 18 years of age at the time of operation, the oldest was 67 and 30 were 30 years old or less. The age distribution at the time of onset of symptoms is demonstrated in table 4. The age distribution of patients with lesions of the rectosigmoid resembled that of the group. Of 21 patients with symptoms of an obstructing lesion only 3 were more than 40 years of age, none were over 45 at the onset of symptoms. One patient was 24, 5 of the 21 patients were 30 or younger at the time of operation.

Most patients with endometriosis have a relatively long duration of symptoms. The average duration in the present series was 2.8 years in the group of 21 patients with obstructing lesions of the rectosigmoid 3.3 years, in the group of 26 patients with rectosigmoid lesions but without evidence of obstruction 2.3 years, the lesions here being of more recent origin.

A high incidence of sterility usually is considered a characteristic of endometriosis and associated pelvic disease. In the present series 40 patients (34 per cent) complained of absolute sterility, 48 (41 per cent) had been pregnant all pregnancies having been prior to the onset of symptoms of endometriosis, and 29 (25 per cent) were unmarried or without established sterility. Keene and Kimbrough¹¹ found absolute sterility in 40.9 per cent of 118 cases of endometriosis and in the remaining patients an average interval of 9.5 years elapsed since the birth of the last child. Allen¹⁸ was impressed by the prevalence of relative sterility in his study of 112 patients with endometriosis.

A high incidence of menstrual abnormalities was found in the present series. Ninety-five (81 per cent) complained of dysmenorrhea of the acquired type, metrorrhagia or menorrhagia. Allen¹⁸ reported a high incidence of menstrual irregularities. Counseller¹² and Masson¹³ found menstrual abnormalities in 80 per cent of 884 cases of adenomyosis of the uterus and pelvic endometriosis.

The symptoms of patients with constricting endometriosis of the rectosigmoid include presenting complaints of menstrual abnormalities, absolute or relative sterility and a long history of bowel symptoms suggesting an obstruction. Weight loss or other evidence of ill health is seldom present. The most frequent complaint of the 21 patients with obstructive symptoms in the present series was severe progressive constipation usually associated with pain in the low abdomen, which was worse at menstruation. Four patients complained of pain with bowel movements, two had cramps and diarrhea during menstruation, one patient had small ribbon-like stools associated with cramps. Other symptoms included flatulence, abdominal distention, bloating and abdominal discomfort. Fourteen of the 21 patients (67 per cent) had exacerbations of bowel symptoms just before or during menstrual periods.

Endometriosis of the rectosigmoid may have few significant physical manifestations, depending on the location and extent of the lesion. Sigmoidoscopic examination may reveal narrowing of the lumen of the bowel with intact but puckered, red and congested mucosa. The mucosa is rarely sufficiently involved or ulcerated to make biopsies feasible. Biopsy then establishes a positive diagnosis and excludes carcinoma. The intact mucosa explains the low incidence of gross or occult blood which would not be accounted for by other anorectal disease. Endometriosis of the rectosigmoid

rarely causes loss of weight or cachexia. The concentration of hemoglobin in the blood may be decreased significantly, depending on the severity and duration of associated menorrhagia.

ROENTGENOLOGIC CHARACTERISTICS OF CONSTRICTING ENDOMETRIOSIS OF THE RECTOSIGMOID

The barium contrast enema has been considered of little value in the diagnosis of constricting endometrial lesions of the rectum and sigmoid colon. Mayo and Miller²³ state that roentgenograms may reveal constricting lesions which have no diagnostic characteristics. Maclean²⁴ believes that a barium enema contributes little to the diagnosis except to demonstrate an obvious filling defect. The Pattons³ believe that a barium enema may reveal a filling defect with normal mucosal pattern. Medical literature since 1931 includes the report by Jostesson² of 1 case in which characteristic roentgenologic signs were present. He states that the characteristic roentgenologic findings are a well circumscribed stenosis of the intestinal lumen with an

intact mucous membrane. The intestinal portions close to the constricted region present only a picture of mild colitis. The folds of the mucous membrane at the site of the stenosis are prickly and irregular but not ragged and stiff as in carcinoma. He stresses the importance of roentgenologic examinations during menstruation and in the intervals to demonstrate changes in the constricting lesion.

The presence of positive roentgenologic signs of endometriosis of the rectosigmoid depends on the extent of bowel involvement and on the location of the lesion. Implants on portions of the bowel which are freely suspended by a mesentery are less likely to have constricting lesions than are portions of the bowel which are partially extraperitoneal and more firmly attached such as the rectum and lower portion of the sigmoid colon. Two factors probably produce obstructing lesions: first, the endometrial tumor which may involve the bowel wall sufficiently to compromise the lumen, although the mucosa rarely is invaded; second, the intense inflammatory reaction, which is the principal

²⁴ Maclean, N. J. Endometriosis of Large Bowel. *Canad. M. A. J.* 53 (March) 1946.

basis for the roentgenologic findings. This inflammatory reaction may result in fibrosis and cicatricial contracture of the bowel wall when lesions have been present for a considerable time, although patients with definite constricting lesions examined in this department by barium enemas after surgical castration had almost complete restoration of the lumen of the bowel.

Four of the 21 patients with constricting lesions of the rectosigmoid in the present study had barium enemas (figs. 1 and 2) which demonstrated certain roentgenologic signs: 1. A filling defect of considerable length involved approximately 4 to 7 inches of the lumen of the bowel. 2. A sharp demarcation of the filling defect was similar to carcinoma. 3. Other portions of the colon showed little evidence of disease. 4. The fluoroscopic examination and the barium-contrast films revealed an essentially intact mucous membrane. 5. The involved portions of the bowel were relatively fixed and exquisitely tender to palpation during the fluoroscopic examination.

Endometriosis of the rectosigmoid should be differentiated most frequently from primary carcinomas of the rectum and sigmoid colon or other infectious or inflammatory lesions. It usually can be differentiated clinically from carcinomas by the younger age group, associated sterility and menstrual abnormalities, absence of loss of weight and anemia and the relatively long duration of symptoms. Exacerbation of symptoms coinciding with the menstrual period is confirmatory.

Fig. 1 (E. M., aged 32) —Preoperative barium contrast roentgenogram demonstrating filling defect of sigmoid colon caused by endometriosis.

evidence of endometriosis. Endometriosis of the rectosigmoid is characterized roentgenologically by a long filling defect with sharp regular borders, intact mucosa, inconstancy of the filling defect and fixation of the bowel, which is exquisitely tender to palpation. Carcinoma, in contrast, is characterized by a short filling defect, sharp irregular margins, ragged, moth eaten

mucosa, constant filling defect and usually absence of fixation or exquisite tenderness on palpation. Infectious lesions usually may be differentiated clinically on the basis of fever, leukocytosis, loss of weight, anemia, stool examinations and bacteriologic or serologic tests.

Fig. 2 (E. M., aged 32) —Spot film during fluoroscopic examination to show intact mucosa.

These lesions are characterized roentgenologically by a relatively long filling defect with ill defined irregular borders, distorted mucosal pattern, an indefinite line of demarcation between normal and pathologic portions, variable filling defect influenced by medical treatment and considerable fixation and tenderness on palpation.

TREATMENT OF ENDOMETRIOSIS OF THE RECTOSIGMOID

The treatment of endometriosis of the rectosigmoid is summarized by Cattell,¹⁰ who emphasizes the importance of conservative treatment in patients under 35 years of age whenever possible. He states that radical treatment is necessary in most cases in which there is involvement of the colon and rectum. Such cases, irrespective of age, require removal of both ovaries. It is rarely necessary to resect the bowel. Pemberton¹¹ restricts roentgen therapy to patients of whom conservative treatment to preserve the childbearing function has failed.

Roentgen examination of the colon by barium enemas is important following sterilization. All patients in the present series with constricting lesions of the rectosigmoid caused by endometriosis, when examined more than two months after surgical castration, had complete restoration of the lumen of the bowel (figs. 3 and 4). Palpation during the fluoroscopic examination

¹⁰ 25 Pemberton, F. A. Endometrioma of the Female Genital Organs. New England J. Med. 217: 1 (July 1) 1937 in discussion of paper by Counsellor.¹²

demonstrates a freely movable colon without tenderness. These findings differentiate endometriosis from constrictions caused by a malignant growth or inflammatory processes, in which little or no improvement follows sterilization.

COMMENT

The important role of endometriosis as a cause of constricting lesions of the rectosigmoid is demonstrated by the preceding statistics. Careful evaluation of the clinical history, physical examination and roentgenologic studies of the colon by means of barium enemas is of value in obtaining an accurate preoperative diagnosis of the more advanced cases of constricting endometriosis of the rectosigmoid when a differentiation from carcinoma or from certain nonoperable inflammatory lesions is essential. The differential diagnosis of any constricting lesion of the rectosigmoid in women during active menstrual life should include endometriosis as a prominent etiologic factor.

A correct preoperative diagnosis of endometrial implants on the rectosigmoid colon without compromise of the lumen of the bowel was made in several patients examined in this department. In the less advanced lesions there was a well demarcated, localized, irritable segment, usually 3 to 5 inches long and quite tender on palpation, especially before or during menstruation. Other portions of the colon were relatively free from

Fig 3 (W. S. aged 25)—Preoperative barium contrast roentgenogram demonstrating filling defect of sigmoid colon caused by endometriosis.

spasm, irritability or demonstrable disease. The clinical history was important in making the correct diagnosis in less advanced lesions.

SUMMARY

1 Endometriosis is common in women during their active menstrual life.

2 Endometrial implants on the rectosigmoid occur frequently in patients with pelvic endometriosis in 40 per cent of 117 patients in the present series and in 15 to 40 per cent of the series found in the medical literature.

Fig 4 (W. S. aged 25)—Postoperative barium contrast roentgenogram three months after surgical castration demonstrating complete restoration of lumen of the bowel.

3 An accurate preoperative diagnosis of constricting endometriosis of the rectosigmoid can be made from clinical characteristics and roentgenologic findings by means of barium enemas.

4 The more common clinical characteristics of constricting endometriosis of the rectosigmoid include (1) age range, usually between 25 and 45 years, (2) high incidence of menstrual abnormalities, (3) absolute or relative sterility, (4) long history of bowel symptoms suggesting progressive obstruction with frequent exacerbations at menstruation, (5) absence of cachexia or loss of weight, (6) infrequent gross or occult blood in the stool in the absence of other anorectal disorders, (7) high incidence of associated benign uterine tumors, and (8) demonstration of narrowed lumen of the bowel with intact mucosa when the lesion can be reached with the sigmoidoscope.

5 The roentgenologic findings of constricting endometriosis of the rectosigmoid includes (1) a filling defect approximately 4 to 7 inches, (2) a sharp demarcation of this filling defect similar to carcinoma, (3) little evidence of disorders in other portions of the colon, (4) an essentially intact mucous membrane and (5) fixation and tenderness to palpation during fluoroscopic examination.

6 Castration without resection of the colon resulted in complete restoration of the lumen of the bowel in patients examined preoperatively and postoperatively by barium enemas.

7 The differential diagnosis of a constricting lesion of the rectosigmoid in a woman during her active menstrual life should include endometriosis as a prominent etiologic possibility.

8 Constricting lesions of the rectosigmoid are of sufficient frequency to warrant careful consideration before extensive resection of the colon or rectum is attempted.

1159 South Michigan Avenue

SOLITARY DIVERTICULITIS OF THE CECUM

JOEL W. BAKER, M.D.

AND

THOMAS CARLILE, M.D.

SEATTLE

The right lower quadrant of the abdomen is the site of the most common inflammatory lesions of the peritoneal cavity. Because of the frequency of acute appendicitis and its complications and the frequency of surgical intervention it is worth while to report 2 cases of a relatively rare condition which is occasionally encountered when the diagnosis of appendicitis has been made.

Thirty-seven cases of solitary diverticulitis of the cecum have been found in the American and British literature. Those cases were excluded in which other diverticula were found either at operation or on subsequent x-ray examination of the colon. In a considerable number of cases (24 of 39) no information was available concerning the presence or absence of other diverticula. However, the essential pathologic process in each case was in a solitary diverticulum that was demonstrated to be acutely inflamed at operation. One of Satterlee's¹ cases described as an intussusception of the cecum and appendix into a large diverticulum of the cecum, was not included because the essential pathologic condition was not a diverticulitis. Similarly a case observed by Hartzell² was not included because other diverticula were present, although the primary pathologic condition was located in an isolated diverticulum of the cecum. The diverticulum was acutely inflamed and was surrounded by an inflammatory mass. When the colon was examined with barium it was found that the opaque medium entered the peritoneal cavity through a perforation in the diverticulum. General peritonitis caused death.

The report of 2 cases follows.

CASE 1—V. M., a white man aged 34, was diagnosed at the Mason Clinic in August 1918 as having duodenal ulcer. He responded satisfactorily to medical management. There had been a tendency to constipation.

The patient returned in September 1922. On the day previous, after an automobile ride, he noticed a dull, steady abdominal pain, which was worse on the right side. On the day of admission the pain settled definitely in the right lower quadrant. There was no nausea or vomiting. The patient noticed a lump in his right side. There was no history of a previous similar attack.

On examination the pulse rate was 108 and the temperature 99.4 F. There was point tenderness just medial to the right anterior superior spine and a palpable tender mass the size of a hen's egg. The rectal examination was negative. The leukocyte count was 20,800, the differential count showed 90

per cent neutrophils and 10 per cent lymphocytes. Examination of the urine disclosed no abnormality. The serologic reaction of the blood was negative. A diagnosis of appendicitis was made.

At operation there was found generalized peritonitis with free pus. The left side of the cecum was "black and gangrenous." There was a diverticulum containing a fecalith the size of a lemon. The cecum was resected and an anastomosis between the ileum and the ascending colon was made. Recovery was uneventful. A pathologic report was not contained in the record. No subsequent x-ray studies were made.

CASE 2—*History*—D. B., a white man aged 59 was first seen at the Mason Clinic in April 1940, when a diagnosis of chronic pulmonary fibrosis was made. Repeated examinations of the sputum for tubercle bacilli were made and were reported as negative.

In May 1941 he was seen at home with a moderately severe respiratory infection. Slight tenderness of the lower part of the abdomen was noted. After being under observation for

Fig 1 (case 1)—Solitary diverticulum above ileocecal valve

three days he was admitted to the Virginia Mason Hospital on the fourth day because of an increase in abdominal tenderness. The respiratory infection was subsiding. Moderate constipation and anorexia were present but neither nausea nor vomiting. A history of earlier attacks of pain in the right lower quadrant of the abdomen was not secured. For a number of years, he said, he had had periodic attacks of a dull ache in the epigastrium. These occasionally came on at night and were relieved by the taking of food or sodium bicarbonate. Fluoroscopic and x-ray examination of the stomach and duodenum had been done elsewhere and were reported as negative. These earlier symptoms had subsided spontaneously two years before the present illness came on. The history of the gastrointestinal tract otherwise was negative.

Physical Examination—The temperature was 101.4 F and the pulse rate 108 a minute. Tenderness was present over the lower part of the abdomen, particularly in the midline. There was no spasm nor rigidity. No mass was palpated. Rectal examination was negative. Rales were heard throughout both lung fields, as they had been on all previous examinations during the past year. The leukocyte count was reported as

¹ Satterlee, G. R. *Disease Conditions of the Cecum: Etiology, Pathology and Treatment*. New York: M. J. 100: 851, 1914.
² Hartzell, H. V. Personal communication to the authors.

22950 per cubic millimeter, 88 per cent were neutrophils and 12 per cent were lymphocytes. A diagnosis of acute appendicitis was made.

At operation the appendix appeared obliterated at the appendiceal junction. There was peritonitis of the distal half. A mass in the center of the abdomen proved to be omentum.

Fig 2 (case 2)—Solitary diverticulum at base of cecum

wrapped around the cecum. The omentum was lifted and an ounce of pus with an odor of colon bacillus was evacuated. This abscess was caused by perforation of the solitary diverticulum of the cecum 2.5 cm laterally across to the base of the appendix. The diverticulum was 2.5 cm in diameter. Its serosa was necrotic but intact, it was puffed out like a hammock. The diverticulum was resected and the opening in the cecum closed. The appendix was removed. A small Penrose drain was placed in the lateral gutter and the incision was closed in layers.

The postoperative course was uneventful. A Mantoux test on the fourteenth postoperative day was positive. Fluoroscopic and x-ray examinations of the barium filled colon with stereoscopic air injection films three months postoperatively showed

Fig 3—Location of solitary diverticula in 39 cases

1 normal cecum with no other diverticula in the cecum or in the remainder of the colon.

Pathologic Examination—Gross. The specimen consisted of a cylindrical piece of tissue measuring 2.5 cm at one end and 2 cm at the other. The base was 1.5 cm thick and opened through a 0.5 cm aperture into a sac having two layers. The layers were discrete in the fixed specimen.

Microscopic. At one end of the section was normal mucosa of the colon. This gradually became involved in an inflammatory process which destroyed the mucosa at the junction with a thin walled structure. This structure was lined on one surface with mucosa showing a definite inflammatory change which extended into the submucosa. A thin layer of circular muscle was present which was approximately one eighth as thick as the muscularis of the normal colon. The other surface consisted of serosa lying next to a zone of intensely inflamed areolar tissue. One atypical giant cell was seen.

The diagnosis was acute and chronic inflammation of a true diverticulum of the colon.

SUMMARY OF CASES FOUND IN THE AMERICAN
AND BRITISH LITERATURE FOR THE PAST
TWENTY YEARS

In all, 37 cases were found in the literature, the 2 cases here reported making 39. These have been analyzed from the available data in an effort to find common features. The ages of the patients ranged from 10 to 69 years. There were 2 patients in the second decade, 7 in the third decade, 8 in the fourth, 7 in the fifth, 10 in the sixth and 5 in the seventh. There were 21 females and 18 males. In 18 cases, previous attacks

of pain in the lower part of the abdomen were reported. In 7 cases there was a history of constipation. Constipation was denied in 10 and not mentioned in 22 cases. Vomiting occurred in only 5 cases of the series. In 13 cases it was neither recorded nor denied. The temperatures ranged from 97.4 to 102 F, in 20 cases the temperature was between 99 and 100 F. The pulse rate ranged from 50 to 140 a minute, the majority of reports gave the rate as between 80 and 89. The leukocyte count ranged from 6,000 to 23,000 per cubic millimeter. A mass was found in 16 cases and the suggestion of a mass in 3 cases. In 7 instances it was stated that there was no mass. The presence or absence of a mass was not recorded in 13 cases. Tenderness in the right lower quadrant was present in 36 cases, absent in 1 case and not reported in 2 cases.

At operation the following conditions were encountered. In 4 cases fluid was present. In 16 cases there was local peritonitis. In 1 case general peritonitis was present. In 3 cases the appendix had been removed previously. The appendix was normal in 22 cases, slightly inflamed in 9 cases and acutely inflamed in 2 cases, its condition was not recorded in 3 cases. In 20

cases a fecalith was found in the diverticulum, in 11 cases the presence or absence of a fecalith was not recorded

In 3 reports it was mentioned that exploration for other diverticula was negative. In 12 cases x-ray examinations of the colon were negative for diverticula. In 11 cases the diverticula were classified as true diverticula. In 10 cases they were classified as false diverticula. In 18 reports the presence or absence of muscular fibers was not recorded.

In 2 cases there was evidence of local tuberculosis, and 1 patient had active pulmonary tuberculosis at the time of operation but no local manifestations. In 1 of the cases herein reported, one typical giant cell was noted.

COMMENT

Diverticula may be classified as either congenital or acquired. Congenital, or true, diverticula consist of all the layers of the bowel wall, acquired diverticula may be subdivided into primary and secondary. Primary acquired diverticula are due to deficiency in the circular muscle of the wall with herniation of the mucosa through the deficiency, secondary diverticula are due to previous operative intervention or adhesions.

Greenstelder and Hiller,³ in reporting 2 operative and 2 autopsy cases of such diverticula of the cecum, list

TABLE 1—Location of the Diverticula

Location of Diverticulum	Cases
By of cecum	1
Medial above the ileocecal valve	1
Between the valve and the appendix	2
Lateral below the level of the valve	2
Lateral above the level of the valve	2
Anterior wall	6
Posterior wall	1
Total listed	11

the following mechanisms: (1) excision of the cecal wall between two constricting bands, (2) traction by adhesions, (3) excision of a weak spot in the cecal wall caused by migration of a purse-string suture into the lumen of the intestine and (4) excision of the weakened area in the cecal wall resulting from the rupturing into the cecum of an abscess of the appendical stump.

Wilson⁴ states that there are three primary factors entering into the formation of a diverticulum: (1) inherent weakness in the wall of the bowel due to age, congenital weakness, obesity or atrophy of the fat along vessels which penetrate the wall, (2) intracolonic pressure and (3) traction on appendices epiploicae, mesentery or omentum with or without adhesions.

The differential diagnosis of solitary diverticulitis of the cecum is almost impossible to make preoperatively. In a majority of the cases in this series a preoperative diagnosis of appendicitis was made. The abdomen was opened in the belief that the condition could be remedied easily by one with a minimum of surgical training. On the discovery that the appendix is normal or not primarily involved (this occurred in 29 of 31 cases), two questions arise: What is the nature of the lesion? and What shall be done about it? In addition to appendicitis there are a number of other lesions of the cecum

which require different types of surgical intervention, varying from simple closure to partial colectomy.

The differential diagnosis and choice of procedure at operation are of utmost importance in minimizing the risk to the patient. The presence of a mass (found in 13 of the 23 cases in which such a finding was noted or denied) further complicates the picture.

Aside from appendicitis, cancer is the most frequent lesion of the cecum. In differentiating cancer from diverticulitis the problem is facilitated if one keeps in mind the three types of malignant tumors of the bowel. The first type grows by cauliflower-like projection into the lumen of the bowel and is very slow to metastasize, the second type grows by direct extension through or along the various coats of the bowel and is a little more apt to show glandular metastases, the third type ulcerates rapidly through the bowel wall and, at operation shows many glandular metastases.

Tuberculosis is the next most frequently encountered lesion of the cecum. As a rule the ileum also is involved. Small tubercles can occasionally be seen on the serosa. The peritoneum is usually thickened. The lymph glands are large and caseous, and adhesions are frequently present. Both ulcerative and hyperplastic forms exist.

Actinomycosis of the bowel usually starts in the cecum or the appendix. The wall may be greatly thickened, and in later stages small abscesses are formed which may open through sinuses in the abdominal wall, discharging the characteristic sulfur granules.

Nonspecific ulcers of the cecum are encountered with approximately the same frequency as diverticula. They may be single or multiple. It has been pointed out by several authors (Harrison,⁵ Cameron,⁶ Wilkie⁷) that the usual location is on the medial aspect of the cecum above the ileocecal valve. Of the 23 cases of diverticulitis herein reported in which there was information sufficient to localize the diverticulum, 2 were reported to have the diverticulum in this region. The problem encountered is the same as that in diverticulitis. There should be minimal surgery rather than wide resection. All the complications of peptic ulcer have been seen in ulcers of the cecum: acute and subacute perforation, hemorrhage and obstruction.

Simple inflammatory tumors of the cecum in which there was no definite etiology have been reported by Bryan,⁸ Rhodes, in discussing Bryan's cases, adds the report of a case which he terms "carbuncle of the cecum" in which there were multiple abscesses of the cecum and ascending colon.

In 14 cases in this series, resection of the cecum and/or ascending colon was considered advisable, either because of the extent of the lesion or because the lesion was thought to be malignant or tuberculous.

CONCLUSIONS

Solitary diverticulitis of the cecum cannot be differentiated from appendicitis. The operative differential diagnosis is of utmost importance in determining the type of procedure to be followed. The outlook is favorable for complete recovery.

EFFECT OF PHENOTHIAZINE ON
INTESTINAL PARASITES

WILFRED N. SISK, M.D.

ASHEVILLE, N. C.

Cases of intestinal parasitism have been coming to the attention of the Buncombe County Health Department for a long time. In one group of children whose feces were examined, because of their particularly undernourished appearance, 80 per cent (approximately) had some form of intestinal parasite. The great majority of these children were infected with *Ascaris*. These children were treated with reasonable success with several different drugs. But the few cases of *Oxyuris vermicularis* (pinworm) infection which showed up with the feces examination were much more difficult to treat, and at that time no satisfactory treatment was found. In October 1941 the Parke-Davis representative called to my attention the work of Manson-Bahr¹ in London in treating with phenothiazine 9 patients who were infected with pinworms. The Parke-Davis company has furnished me with a supply of phenothiazine (under the trade name of nemazene) for use in treating the patients found infected with pinworms. This paper contains the result of my experience with phenothiazine in the treatment of various parasitic infections.

Phenothiazine is a new preparation which is being used experimentally in human beings at the present time. It is distantly related to sulfanilamide. It is the parent substance of a large number of dyes, one of which is methylene blue. It is being used as an insecticide spray for fruits and vegetables. Phenothiazine has been found of value in the treatment of worm infections of cattle, sheep, swine and horses, and the control of mosquito larvae in ponds. It has recently been found effective in the treatment of certain cases of urinary tract infections. It is prepared by fusing diphenylamine with sulfur in the presence of iodine as a catalyst. Phenothiazine thionol and leukothionol (two excretion products) have the following structural formulas respectively:

METHOD OF DIAGNOSIS—*OXYURIS VERMICULARIS*

The feces specimen is inadequate for the finding of the ova of the pinworm (also known as threadworm, seat worm, *Oxyuris vermicularis* and *Enterobius vermicularis*). The female migrates from the rectum² during the early hours of sleep and deposits its eggs in the moist folds of skin as far forward as the scrotum. In the morning the only vestige of the female worm left is a dried carcass. This accounts for the difficulty in getting specimens of live worms.

A number of studies have been made within recent years using some variation of the NIH swab.³ This is a swab composed of a piece of cellophane attached to a glass rod by a rubber band. In my own study a modification of this swab was found most effective with rural children. This modified swab consists of a piece of cellophane of medium thickness about 1½ inches long and 1 inch wide glued to an ordinary wooden applicator about 4 inches in length. The ordinary 6 cc test tube, such as is used for taking blood for Wassermann tests, serves as a container. A gummed label and cotton stopper complete the equipment.

The cellophane swab is placed over the index finger and rubbed about the anus. It is preferable to take the specimen in the morning before bathing or going to the toilet. In the laboratory the cellophane is cut off and placed on a microscopic slide with two drops of water, and a cover slip is placed over it. Diagnosis is made by finding the typical ova.

RESULTS OF SURVEY

Three groups were surveyed. All groups consisted entirely of white people.

1. The children of the first six grades of a rural consolidated school were examined. The school is located at Barnardsville and serves a rural population of 2,881 in Ivy Township, 22 miles northeast of Asheville, N. C. Specimens were obtained from 274 boys and girls ranging in age from 6 to 13 years, with a few children as old as 16 years. The specimens were taken by a physician and nurse between the hours of 10 and 11 a. m. Only 1 specimen was taken on each child. Of the 274 examined 45, or 16 per cent, were found positive. The work of several investigators⁴ shows that from 4 to 7 specimens are necessary before a person can be judged to be uninfected with pinworms. Therefore the 16 per cent found must be considered the absolute minimum of pinworm infection in this school group.

2. One hundred and fifteen boys from the National Youth Administration resident center at Newbridge, N. C., were examined. These boys ranged in age from 16 to 24 years. They are a selection of high school graduates from western North Carolina and surrounding area. Of these 115 examinations only 4 or less than 4 per cent, showed the presence of *Oxyuris vermicularis*.

3. The children at Mountain Orphanage (15 miles west of Asheville, N. C.) were examined. These children sleep in large wards with the beds placed close together. Of 62 children examined by two swabs 24, or 38 per cent, were found to be infected with pinworms.

FAMILIAL INCIDENCE OF *OXYURIS*

There were 26 families rechecked carefully with cellophane swab specimens. The cooperation was not entirely satisfactory in the older children of the family. The young adults between the ages of 16 and 25 particularly seemed to be embarrassed and did not cooperate particularly well in giving good specimens. For this reason the familial incidence appears lower than the true incidence. In the family study 96 members were found positive and 46 members negative. In 5

families all members were positive. In 7 families only 1 member in each family was negative. At the other extreme, in 5 families only 1 member in each family was found positive. In the latter group of 5 families, cooperation in preparing specimens was so poor that no treatment was attempted.

COMMENT

Pinworm infection was thought until recently to be most prevalent in urban areas where crowding is a definite feature. A study was made by Sawitz⁶ in which he showed that there was a much higher percentage of infection in children sleeping in wards than in children sleeping in individual rooms. The incidence he found in orphanages ranged from 15 to 96 per cent. This finding suggests that the crowding of sleeping quarters is the factor of importance. Work of Cram and her co-workers makes the same point. Cram found an incidence of 57 per cent among boys of low economic status in Washington, D. C. She also found an incidence of 35 per cent among 628 persons from the same economic group of the general population of Washington. Brown⁷ found an incidence of 32 per cent from a similar group of boys at Charlotte, N. C. He also found no infection in a group of 118 University of North Carolina students. Infection rates of from 15 to over 90 per cent have been found in as widely scattered areas as Toronto, Iampu, Manila and Georgia.⁸ These have all been white people in the lower economic groups.

It would seem that an infection of 16 per cent of children from the lower economic groups of rural families is consistent with the findings in more urban areas. The homes in the Barnardsville area are predominantly crowded. Several people usually sleep in one room—sometimes the entire family.

Family incidence was studied by Cram.⁷ Her results correspond closely to those found in Buncombe County. Clinical observation leads me to believe that family incidence is practically 100 per cent. The inadequacies of even the improved cellophane swab methods of diagnosis make it imperative to consider all members of any household where infection is found to be infected.

SYMPTOMS OF OXYURIS INFECTION

The chief symptoms caused by infection with Oxyuris are (1) restlessness at night, (2) poor appetite, (3) nightmares, (4) itching about the rectum, (5) bedwetting, (6) sleepwalking, (7) nervousness and (8) indigestion. These symptoms are given roughly in the order of their frequency. The patients may vary in their symptom complex from practically no symptoms to all those enumerated. Particularly in the younger children did I find the symptoms worse. Several children were very much underweight, had circles under their eyes and showed moderate degrees of anemia.

Symptoms shown by 106 patients were tabulated to determine the frequency of their occurrence. A few patients exhibited only one of the symptoms while some patients gave a history of almost the entire symptom complex. A striking example of the latter is case 16.

CASE 16—A white girl aged 8 years was brought to the clinic because of extreme nervousness and loss of appetite. The patient was particularly bothered by insomnia. She jumped frequently in her sleep and cried out as though frightened. Her appetite was poor. She would eat a small breakfast, then carry only two sandwiches to school for lunch. She would seldom eat more than half of one sandwich for lunch. The patient was underweight and pale and had dark circles under her eyes.

She was given 3 Gm of phenothiazine a day for five days. Within a week after this treatment she had a large breakfast every morning and was not satisfied with less than four sandwiches for her lunch. She gained 12 pounds (5.4 Kg.) within the following three months and her nervousness disappeared. Her sleep has been restful and undisturbed.

RESULTS OF TREATMENT

The work of Manson-Bahr¹ suggested that 40 Gm of phenothiazine would be needed to remove Ascaris and pinworms from adult patients. This dose was divided into five daily doses of 8 Gm each.

In the first series of patients I tried to follow the dosage schedule suggested by Manson-Bahr. For convenience I shall refer to this as schedule 1. Eight adult patients were selected who had both Oxyuris and Ascaris infection. They were given 8 Gm of phenothiazine a day. Four of the patients completed the treatment and 4 had to reduce the dosage. All the patients complained of nausea. Four patients vomited

TABLE 2—Schedule 2

	Dosage Gm	
	Per Day	Total
Adults	4	20
Children		
8 to 12 years	3	15
4 to 8 years	2	10
2 to 4 years	1.5	7.5
Under 2 years	1	5

several times and 2 patients became quite dizzy. Five children were treated with comparable dosages ranging from 4 Gm a day for a 4 year child to 7 Gm a day for a child of 12 years. All complained of severe nausea and vomiting.

All of the 12 patients were followed for a minimum of ten weeks, and six cellophane swabs, or more, were obtained from all patients. All swabs were negative and the symptoms of pinworms disappeared promptly after treatment. Five of the patients were seen eight

months after treatment and were still symptom free. The results as to the removal of *Ascaris* was not very encouraging.

In view of the discouraging results with *Ascaris* and the constant complaint of nausea and vomiting, no further attempts were made with this large dosage of

TABLE 3—SEVENTY-FIVE PATIENTS RECHECKED

	Number of Patients	Percentage
Cured on first treatment	56	74
Not cured until second treatment	7	9
Not cured by 1 treatment but refused second treatment	12	17

40 Gm (8 Gm a day for five days). A dosage schedule was worked out (table 2). In all 89 patients have received phenothiazine according to this schedule. There were 68 who had no toxic symptoms during treatment. Of the 20 who showed some reaction, the only symptom noted by 11 patients was nausea for two or more days. One patient became so nauseated that she could not take the full dose. One patient became dizzy. One patient said the treatment made her left leg and side hurt. Five patients vomited several times between the second and fifth days of treatment. One of the latter four became quite pale. One patient had a very severe toxic reaction to treatment. An abstract of her case history is given.

CASE 84—A white girl aged 14 had a poor appetite. She was restless in her sleep. She was pale and nervous. Her family had a diet in which there was practically no animal protein. They ate no eggs, milk or meat.

She was given 4 Gm of phenothiazine a day for five days (total 20 Gm). On the fourth day of treatment she became nauseated and vomited. On the sixth day she became pale and noticed blood in her urine, and she complained of headache. She vomited daily from the fourth to the ninth day. On the ninth day she was admitted to St. Joseph's Hospital. Physical examination revealed that the mucous membranes were pale, there were no petechiae or jaundice and the heart was slightly enlarged with pulmonary and aortic systolic soft blowing murmurs transmitted to the axilla. The temperature was 99.6 F. The blood count was 1,450,000 red blood cells, 31,500 white blood cells and hemoglobin 30 per cent. The differential count showed 69 per cent neutrophils with 4 per cent juvenile cells. There was irregularity in size, shape and staining of the red cells. Many nucleated red cells were seen.

The child was given supportive therapy including a small transfusion of 75 cc of whole blood. She was given vitamin liver and iron concentrates daily. On the twenty-third day after beginning treatment with phenothiazine, the red blood cell count had risen to 3,500,000 and the white cells reduced to 7,800. The hemoglobin rose to 63 per cent. The urine showed no more red cells after the sixteenth day. She was ambulant and has continued well since.

Two of the patient's sisters had a similar, but milder reaction. This child's mother has had toxemia of pregnancy twice.

The clinical picture of this case was similar to 1 reported from Queen Elizabeth Hospital, Birmingham, England.¹⁰ The English child died twelve hours after a transfusion. Autopsy revealed a slight jaundice, multiple small hemorrhages in the brain and watery dark rib marrow. The liver, heart and kidney showed no microscopic damage.

RESULTS

Of the 89 patients treated according to the schedule, 75 were sufficiently cooperative to take recheck specimens. The results are given in table 3. The 14 remain-

ing patients symptomatically were greatly improved but refused to give sufficient recheck specimens to determine the outcome. Most of the 26 patients who refused further treatment or rechecks did so because they were symptomatically cured and did not want to bother about further checks. The exception is the family of the girl who had the severe reaction (case 84).

After these severe reactions occurred, it was decided that a smaller dosage would be preferable if it would produce the desired results. With this in mind, a different schedule was tried with the Mountain Orphanage children (table 4).

The children were watched closely by the matrons, who were instructed to call me if any untoward symptoms developed. No toxic symptoms occurred.

RESULT OF TREATMENT

All 62 children and the 4 adults at the Mountain Orphanage were given the treatment as outlined under schedule 3. Post-treatment cellophane swabs were taken on the entire group. Four children were found to be positive on this examination. Three were children who had been heavily positive on the first examination, and 1 was a child who was negative on the original examination. There were no toxic symptoms of any sort noted in the entire group.

This schedule of dosage appears to be almost as effective as schedule 2. The largest amount of drug given with this dosage is 12 Gm. The smallest dose of phenothiazine causing serious reactions is 20 Gm. This dosage seems adequate and safe and is recommended for routine treatment. The larger dosage of schedule 2 would probably be more effective provided the patient is in good physical condition and care is taken to watch for possible adverse symptoms.

COMMENT

The nature of the pinworm infection makes it imperative to treat and cure all members of a household at one time. I have counted the eggs found in 2 female worms and found 9,860 in 1 and 10,240 in the other. Counts by other workers run from 4,600 to 20,000 eggs per female worm.¹¹ Pinworm eggs are found in the air and dust of homes where an infected person lives.¹² They are found at all layers, even to the molding near the ceiling of the room. Thus a previously uninfected individual may swallow pinworm eggs while other members of the family are being treated.

TABLE 4—Schedule 3

Adults and children over 6 years
(a) 1 Gm a day for 6 days
(b) Rest 3 days
(c) 1 Gm a day for 6 days
Children under 1 year 0.25 Gm a day for the same period
Children 1 to 6 years 0.5 Gm a day for the same period

Family W, consisting of 7 children and 2 adults, illustrates what may happen when members are left untreated. All children were found infected with *Oxyuris*. The mother and father were negative after 4 specimens had been taken on each. The parents were left untreated. The post-treatment swabs on the

11 Reardon, Lucy. Studies on *Oxyuriasis*. VI. The number of Eggs Produced by the Pinworm *Enterobius Vermicularis* and Its Bearing on Infection. Pub. Health Rep. 53: 978-983 (June 17) 1933.

12 Nolan, M. O. and Reardon, Lucy. Studies on *Oxyuriasis*. V. Distribution of Ova of *Enterobius Vermicularis* in Household Dust. J. Parasitol. 23: 173 (April) 1937.

children were negative at first. Then after three months 2 of the children were positive.

Family T illustrates a similar situation. A married daughter, known to have pinworms, became ill from other causes and was unable to take treatment at the same time as the rest of the family. After her return from the hospital, other members of the family became reinfected.

Family B illustrates another situation which must be considered. One very large family living in 3 households consisted of a great grandmother, 2 sets of grandparents, 11 grandchildren and 1 great-grandchild. All 3 households were heavily infected but only 2 households were treated. The result was that, from constant visiting, the 2 treated households became reinfected.

Sawitz¹⁰ and others have shown that once a pinworm infection has entered a household no amount of cleanliness will remove the infection without medical treatment. The problem of treatment of this intestinal parasite then places a heavy burden on the physician who would treat it and on the drug he uses. He must cure not only his patients but also all of the patient's household contacts as well. Treatment of 1 individual will give remarkable temporary relief but absolutely no permanent cure unless his close family associates also are cured.

Because of the inevitable reinfestation of the patient from pinworm eggs about the house, it is desirable to have a drug which can be given conveniently over a comparatively long period of time and one which will be sufficiently effective to obviate frequent retreatment. Phenothiazine given according to schedule 3 answers these requirements at least as effectively as gentian violet and far better than any other drug mentioned in the literature.

HOOKWORM AND TRICHURIS

Four patients were found to be infected with hookworm. They were treated with phenothiazine as follows. Two adults were given 4 Gm of phenothiazine a day for five days. All 5 patients were still found infected with *Trichuris* after the treatment. It would seem that phenothiazine is not sufficiently effective to be worth using in hookworm and trichuris infections.

ASCARIS

Of the patients found infected with *Oxyuris*, 26 were also found infected with *Ascaris*. All these patients were treated with the relatively large dose of phenothiazine shown in schedules 1 and 2. All except 2 of the 26 patients treated passed ascarids in the stool. In most cases the largest number of ascarids were passed between the second and fifth days of treatment, but ascarids continued to be passed up to three weeks following treatment. The largest number passed from any one individual was 46. Even though large numbers of ascarids were at times passed, only 5 patients were completely negative after treatment with phenothiazine. All the ascarids were colored pink through and through.

An interesting case was 10. A white girl aged 3 years took 10 Gm of phenothiazine between February 15 and February 20. She had no symptoms other than pink urine during the time she was taking the phenothiazine. Three weeks later, on March 8, she passed 1 ascarid. Her bowels became loose and on March 12 and 13 she had a definite diarrhea. On March 11 she broke out with a red papular rash over the entire body. On March 12 she passed 26 ascarids. They were all colored pink from the phenothiazine. The child had no

other medication during this entire period. Her feces specimen was still positive for *Ascaris* on April 18.

Phenothiazine is effective in removing a portion of the ascarids, but a comparatively large dosage must be used. No ascarids were passed by patients treated with the small dosage under schedule 3. A quicker acting drug would certainly be more desirable for the treatment of ascaris infections. I do, however, find a usefulness for phenothiazine for small children who cannot swallow a capsule whole. Phenothiazine will remove ascarids from small children reasonably effectively and with less toxic symptoms than *santonin*.

SUMMARY AND CONCLUSIONS

1. A simple modification of the NIH swab for the diagnosis of *Oxyuris vermicularis* infection consists of a piece of cellophane glued to the end of a wooden applicator. This may be put into a glass test tube for easy transportation.

2. A survey, with a single cellophane swab, was made in the first six grades of a rural elementary school. A minimum infection rate of 16 per cent was found. These children were largely from homes which were crowded and from families in the lower economic levels.

3. A group of high school graduates from the NYA resident center were found to have less than 4 per cent infection with *Oxyuris vermicularis*.

4. The children at the Mountain Orphanage were found to have an infection rate of 38 per cent with *Oxyuris vermicularis*.

5. Approximately two thirds of the members of all families in which *Oxyuris* was found gave swabs positive for *Oxyuris*. In 5 families all members were positive.

6. The chief symptoms caused by infection with *Oxyuris* were found to be restlessness at night, poor appetite, nightmares and itching about the rectum. These symptoms are given in the order of their frequency.

7. Treatment for *Oxyuris* was tried with three different schedules of dosage. Phenothiazine was used in all cases.

(a) Schedule 1, which consisted of a total dose of 40 Gm of phenothiazine for adults, was found too toxic. It was quite effective in the removal of the *oxyuris* infection in those patients who were able to take this large dosage.

(b) Schedule 2 consisted of a total dose of 20 Gm of phenothiazine for adults, which was given over a period of five days. Of 89 patients who received this dose, 79 had either no toxic symptoms or only mild nausea. Two patients in the same family had very severe reactions. They showed anemia, high white cell count, nucleated red cells and blood in the urine. These findings were in addition to severe nausea, vomiting, pallor and headache.

(c) Schedule 3, with a total dose of only 12 Gm of phenothiazine for adults, was tried. This schedule gave results not quite as good as the higher dosage but still satisfactory results. No toxic symptoms occurred in this group.

8. It is necessary to treat all the members of any family or household where infection is found.

9. Phenothiazine was of no appreciable value in the treatment of hookworm or trichuris infection.

10. Phenothiazine was found of some value in the treatment of ascaris infection, but only in large doses.

PRETIBIAL FEVER

AN OBSCURE DISEASE

LIEUTENANT COLONEL WORTH B DANIELS
MEDICAL CORPS, ARMY OF THE UNITED STATES

AND

CAPTAIN H ARTHUR GRENNAN
MEDICAL CORPS, ARMY OF THE UNITED STATES

Late in July and early in August 1942 there appeared in the wards of the Station Hospital at Fort Bragg, North Carolina, a group of soldiers who exhibited an unusual febrile illness. It shortly became apparent not only that these men had identical symptoms but that they all came from a few military organizations quartered near one another in a limited area of the reservation. Between July 29 and September 11, 40 such patients with this illness were admitted to the wards. The usual history was one of relatively sudden onset characterized by malaise, mild general aching, lumbar pain, severe frontal headache and postorbital pain. On the first or second day of symptoms mild respiratory manifestations consisting of coryza, sore throat, chest pain and soreness and cough were complained of by 30 per cent of the patients. The respiratory symptoms were not persistent and were never suggestive of primary respiratory involvement such as is seen in influenza. In about one fourth of the cases nausea and vomiting occurred rarely accompanied by abdominal pain. Shaking chills or chilliness and fever developed. The fever was consistently spiking and frequently showed two or more peaks each day. Often with the elevations there were recurrent chills. During the periods of temperature elevation there was an extreme accentuation of the frontal and postorbital aching while during the periods of lower temperature the patients felt

there was a transient elevation of temperature, sometimes as high as 101.4 F, occurring from two to seven days after the original febrile period. Stiffness of the neck accompanied headache in 3 cases, and in these lumbar puncture was done. All showed normal spinal fluid. There was no noticeable relief of headache following puncture. Adenopathy was not remarkable. A firm spleen was palpable early in the disease in 95 per cent of the cases. Splenomegaly persisted in some for as little

Fig 2—Cutaneous eruption on the legs in case 20

as five days, while in others there was noticeable enlargement after two weeks.

The most distinctive feature of the disease was the appearance of an unusual rash on or about the fourth day of illness. In 60 per cent of the cases this was bilaterally symmetrical and limited in distribution to the pretibial areas. In an additional 20 per cent the pretibial areas were the primary site of the rash, while a few lesions were scattered elsewhere. Two patients had splotchy, generalized cutaneous manifestations including the anterior surface of both legs. One had a single lesion on the hand. In 5 cases, otherwise typical, no rash was observed. Individual lesions consisted of an erythematous localized blush of irregular outline with ill defined borders fading into the surrounding skin. These were often from 2 to 5 cm in their largest diameter, gradually coalescing with adjacent lesions. The lesions were raised, warmer than the surrounding skin and sometimes slightly tender to touch. In some cases the lesions vaguely resembled erythema nodosum. In 2 cases the rash became diffusely distributed over the entire body. In a few cases it appeared urticarial. Following the generalized type there was a residual pigmentation which persisted for about two weeks. None of the lesions were purpuric. In most instances the duration of the cutaneous manifestations was two days but in a few they persisted longer. Figures 2 and 3 illustrate the pretibial and the generalized forms of the rash.

Biopsies of cutaneous lesions were performed in 6 typical cases. They showed diffuse edema and a slight to moderate perivascular infiltration with small round cells and macrophages. It is clear that drugs played no part in the development of this rash. Only 1 patient had received sulfonamide therapy. No other patient received any drug other than acetylsalicylic acid and codeine. Leukopenia was noted sufficiently often to constitute a typical feature. It was present in all except

Fig 1—Temperature pulse and leukocyte count in case 2

relatively well. The fever persisted for from two to eight days but averaged 5.4 days with maximum elevations varying from 99.8 to 105.6 F (fig 1). In 5 cases

From the Medical Service, Station Hospital, Fort Bragg, North Carolina.

Released for publication by the War Department Manuscript Board, which assumes no responsibility other than censorship for the contents of this article.

Dr. John R. Paul, Norman Topping, U. S. Public Health Service and Major Cornelius Philip, San C. U. S. Army, of the Surgeon General's Board for the Investigation and Control of Influenza and Other Epidemic Diseases in the Army, gave permission to use portions of their preliminary report.

5 cases at some time during the acute illness. It developed most commonly between the third and the fifth day of the illness. At the termination of the febrile period the leukocyte count again rose to normal, and in 14 cases there was a slight terminal leukocytosis. The white blood cell count range was from 2,800 to

Fig. 3—Generalized cutaneous eruption in case 9

11,000 cells per cubic millimeter. Differential counts showed little deviation from normal, although in a few cases a moderate relative lymphocytosis was present. Figure 4 is a graphic representation of composite leukocyte counts.

Blood cultures were done in all cases but showed no growth. Agglutinations for proteus OX 19, melitensis, the typhoid-paratyphoid group and heterophil antibodies were consistently negative. Malarial parasites and the spirillum of relapsing fever were searched for but never found.

At the termination of the fever the patients rapidly returned to their original healthy state. There was no postfebrile depletion or depression. There were no complications. Figure 5 shows the incidence of symptoms.

REPORT OF CASES

CASE 4—E. R. D., a white soldier aged 25 of military organization A, admitted to the hospital on Aug 7, 1942, complained of fever and headache. He had been well until two days previously, when he felt feverish and chilly. Severe frontal headache, postorbital pain and severe backache developed. The next day he felt slightly better but on the day of admission the symptoms were all accentuated. The temperature was 101 F, the pulse rate 90 and the respiratory rate 20, the white blood cell count was 8,150 per cubic millimeter. Nothing unusual was found on physical examination. On the fifth day of the illness the spleen was firm and easily palpable. Over the pretibial surfaces of both legs irregular erythematous lesions were noted. These were faintly tender, warm to touch and very slightly raised. His temperature was swinging in

character and ranged from 99.8 to 104.4 F without a corresponding rapidity of pulse. The leukocyte count on this day was 1,900 per cubic millimeter with 65 per cent polymorphonuclear neutrophils, 31 per cent lymphocytes, 1 per cent basophils and 3 per cent eosinophils. On the seventh day of the illness the rash had entirely disappeared, the temperature was normal and he felt well. On discharge the spleen was still palpable.

CASE 2—R. G. C., a white soldier aged 21 of military organization A, admitted to the hospital on Aug 9, 1942 on the third day of his illness, had as initial symptoms frontal headache and pain in the feet and legs which later involved various joints. At the onset there was nausea without vomiting. Shaking chills had occurred on two occasions in the thirty-six hours prior to admission. On examination there were nasal congestion, pharyngitis, signs of generalized bronchitis, a temperature of 104 F, a pulse rate of 92, a respiratory rate of 20 (fig 1) and a leukocyte count of 9,450 per cubic millimeter. His temperature ranged from 99 to 104.6 F with very little acceleration of the pulse. Two hours after admission a rash appeared on the trunk, neck and extremities. This consisted of discrete, brilliantly erythematous, slightly raised warm plaques varying in size from 1 to 8 cm in their largest diameter. The rash was generalized, as in the other cases, the anterior aspects of both legs were involved. The rash remained erythematous for three days, faded gradually and left definite purplish pigmentation, which faded during the succeeding two weeks. The spleen was palpable. On the sixth day the leukocyte count had fallen to 4,350 and on the seventh day to 3,700 per cubic millimeter with no abnormality in the differential count. Convalescence was uneventful.

A summary of 40 cases is shown in table 1.

Toward the latter part of this outbreak a commission consisting of Dr. John R. Paul, Dr. Norman H. Topping and Major Cornelius Philip was assigned by the Surgeon General of the United States Army to investigate the epidemiology and etiology of the disease. Through their courtesy we have been able to use epidemiologic and other data which they have assembled.

EPIDEMIOLOGY

The organizations from which these soldiers came were all quartered in the northern third of the populated area of the reservation near a small stream and

Fig. 4—Composite leukocyte counts in 40 cases

its tributaries. The other areas of the post furnished no patients ill with this disease. For this reason local environmental factors were thought to be of etiologic importance. There was no single locality off the reservation to which all these men went during the month previous to illness. They had no common meeting place. Some of the men had done no swimming, while

TABLE 1—Summary of Forty Cases

Patient	Unit	Date of Onset	Symptoms	Rash				Generalized	Leukocyte Count Lowest and Highest	Spleen	Maximal Fever	Days of Fever

others swam in several different ponds. There was no common swimming place. Several men had gone on maneuvers in Chesapeake Bay, others on the coast of North Carolina, while a large number had not left the post area. We have been unable to calculate the exact incubation period. Five men developed their

be suspected. Sand flies, biting midges and black flies were not found. Bedbugs, stable flies, chiggers, ticks and horseflies were found but for various reasons were considered unlikely vectors.

During the early period of this outbreak the mosquito population on the post was very low, not only because of good control but because of a continued period of low rainfall. Because of the sandy soil in this area, absorption is rapid and standing water is unusual. Various members of the *Culex* species were found. The most frequent of these was *Culex quinquefasciatus*. This mosquito has been disproved as a carrier of dengue. No representative of the dengue vector, *Aedes aegypti*, was found, and there are only a few records of this species being taken during the entire season by the mosquito control officer. *Aedes atlanticus*, *Aedes canadensis* and *Aedes vexans* were found. Their presence is of doubtful importance.

ETIOLOGY

The cause of this disease remains obscure. Extensive studies by the commission are in progress in an attempt to establish the etiology and mode of transmission. Blood and nasopharyngeal washings have been inoculated into rhesus, green African and mona monkeys. A variety of small laboratory animals including guinea pigs, rabbits, mice and rats have also been inoculated with these materials. The yolk sacs of fertile eggs have been inoculated. Emulsions of the stable fly (*Stomoxys calcitrans*) have been inoculated into fertile eggs. Two lots of *A. aegypti* mosquitoes were fed on 2 men during the early phase of their illness. An attempt will be made to transmit this disease by these mosquitoes to human volunteers.

DIFFERENTIAL DIAGNOSIS

A number of different disease entities were considered as possible diagnoses in these cases. In the early cases influenza was suspected, but the transient character and mildness of the respiratory symptoms, persistence of fever, presence of a firm palpable spleen and the unusual rash eliminated this possibility. Endemic typhus seems excluded by the short duration of the illness, the entirely different type of rash and consistently negative Weil-Felix reactions with OX 19 at different periods of the illness. Rocky Mountain spotted fever can be similarly dismissed. In no cases did adenopathy, the characteristic blood changes or the positive heterophil antibodies usually demonstrated in infectious mononucleosis develop. The duration of the disease, negative blood and stool cultures and negative

Fig. 5—Incidence of findings in 10 cases

illness away from the post. Several became ill a few days after returning to the post following ten days on maneuvers. Table 2 shows the onset of illness in 10 patients who were together on maneuvers between August 10 and August 21.

These men returned on August 21, hence 2 developed their disease away from the post, 2 on the day of return and 6 within three days after their return. If the disease is not spread by human contact it seems reasonable to assume that the incubation period is approximately ten to fifteen days or longer. One man left for his home in Pennsylvania on July 27. On August 5 he became ill with fever and headache. His local physician made excellent observations of this soldier's illness. From his records there can be little doubt that he had "pretibial fever." In this case an incubation period of ten or more days is again suggested.

Figure 6 shows the course of the epidemic. Each rectangle represents one case.

The incidence by organization is as follows: organization A 17 cases, B 10, C 5, D 3, E 1, F 1, G 1, H 1 and I 1. Because of the high incidence in organization B during the early period of the epidemic, the dispensary records of this outfit were later examined. It was found that during this period there was a decided increase in the number of cases diagnosed as "influenza," "nasopharyngitis" and "fever of unexplained origin." Of 33 of these cases hospitalized, 9 were diagnosed "pretibial fever" after the rash appeared. In others the rash was either absent or not observed, and various diagnoses were made. It is probable that some of these were examples of this disease.

Factors responsible for the outbreak have not been determined. The commission and the medical inspector of the post made a search for insect vectors that might

Fig. 6—Course of the epidemic on a basis of the date of onset. Each rectangle represents 1 case.

agglutination reactions eliminate the typhoid-paratyphoid group. The parasites of malaria and relapsing fever were sought but not found in any case. Dengue was at first thought to be the probable diagnosis. However, as new cases were observed certain prominent features of that disease were conspicuously absent. No patient had a "camel back" type of fever curve or any postfebrile depletion or depression. The usual vector

of dengue, *A. aegypti*, was not found in the vicinity. It would be unusual for an outbreak of dengue to be limited to such a small group. Its rapid spread to a large portion of the population would have been expected. The type and distribution of the rash is not similar to that seen in dengue. Other described dengue-like diseases such as prappitaci fever, five day fever of Panama and various similar entities were considered. However, the clinical features of pretibial fever showed definite dissimilarity to these in one or more important respects. Search of the available literature revealed no description of a clinical entity into which this group of cases would fit.

An outbreak of what may be the same disease was observed in August 1940 in Wrens, Ga., by Bowdoin.¹ Dr. Bowdoin² writes in part as follows: "Apparently about 35 cases occurred. All patients had a sudden onset within twenty-four hours complaining of severe frontal headache. A number of them complained of soreness behind the eyes. Some two thirds of the patients complained of backache, and about the same number of pains in the legs. Approximately one third of these patients complained of pains in the joints. Some two thirds of the patients complained of nausea, and some few of them vomited. A fleeting type of rash was seen in 6 or 7 cases, which occurred for the most part on the anterior aspects of the legs. One man is known to have had the rash also on his abdomen and

to study this disease." These materials were obtained from 5 patients between the second and fourth day of illness with this disease. Human beings, rhesus and green African monkeys, 1 marmoset monkey, 1 chimpanzee, incubating hens' eggs, guinea pigs, rats, mice and hamsters were inoculated. "All tests on this material proved negative as far as isolating or determining the nature of the infectious agent responsible for this disease was concerned."

Station Hospital, Fort Bragg, North Carolina

SYPHILIS IN THE UNITED STATES
PRIMARILY A NEGRO PROBLEM

W. G. SMILLIE, M.D.
NEW YORK

The results of the serologic blood tests for syphilis that were secured from the first two million reports¹ of selectees for army service in 1940 to 1942 provided an excellent cross section of the prevalence of syphilis in the United States and changed many of our preconceived ideas concerning the epidemiology of the disease in this country.

Syphilis has been called an urban disease, a disease of large cities and seaports, but this is not true in the United States. The urban rate in these men was 4.6 per cent while the rural rate was 4.4 per cent.

Furthermore, syphilis is not a disease of seaports, nor does it have an unduly high prevalence in large cities. The largest cities, such as New York, Chicago, Boston and San Francisco, all have rates of less than 2.5 per cent, whereas the rate for the nation as a whole was 4.5 per cent. Industrial areas do not suffer to an unusual degree. Rhode Island and Connecticut, the two most completely industrialized states in the Union, have rates of 1.1 and 1.2 per cent respectively.

The extraordinary fact brought out by these data is the high prevalence of syphilis in the Negro. This rate permeates overwhelmingly all the other data. In all parts of the United States the rate in Negro men is at least ten times higher than that in white men.

The men examined for service were from 21 to 35 years of age. Table 1 illustrates the high incidence in the Negro and also the increasing prevalence with age in both the white and the Negro.

The geographic distribution of the disease bears a direct relationship to the distribution of the Negro population of the nation. States with a large proportion of Negroes have highest syphilis rates. In each of the forty large cities it will be found invariably that the syphilis rate is in direct proportion to the Negro population.

Furthermore, those states having the highest syphilis rates in Negroes concomitantly have a higher than average syphilis rate in white men.

Table 2 records the five states with the highest syphilis rates in Negroes. In every one of these states the rates in the young white men are above the mean, 2.3 per cent, for the white men of the country as a whole. On the other hand, states that have lowest syphilis rates in the white men also have lower than average rates in the Negro population. This is well illustrated by table 3 which gives the list of five states with the lowest rates in white men. It will be noted

TABLE 2—Onset of Illness in Ten Cases

Day of Leaving Fort Bragg	Date of Initial Symptoms						
	August 10	19th	20th	21st	22d	23d	24th 25th
Number of cases		1	1	2	2	1	3 0

chest. The rash lasted from twenty-four to forty-eight hours. All cases were characterized by very slow pulse, with a range of 55 to 90, varying with temperature range, which was from 100.6 to 104.5 F. All had characteristic dull facies with slight to moderate injection of the conjunctivas. The course was five to ten days with 80 per cent of them having a normal temperature on the seventh day and out of bed on the eighth." A laboratory technician who had done some of the stool cultures is reported to have developed the disease.

SUMMARY

An outbreak occurred of an unusual febrile illness of approximately five days' duration characterized by minimal respiratory manifestations, frontal postorbital and lumbar aching, leukopenia, palpable spleen and an erythematous rash over the pretibial regions.

Forty such cases occurred among soldiers in a localized area of a military reservation during the months of July, August and September 1942.

The etiology and mode of transmission are unknown. It is hoped that investigations now under way will throw some light on this problem.

ADDENDUM—Since this paper was submitted for publication the commission assigned by the Surgeon General of the Army to study the etiology and mode of transmission of this disease has completed its studies. Clinical material in the form of blood, nasal washings and urine from patients, engorged mosquitoes and locally collected flies have been tested in the various laboratories available to members of the group assigned

2. The two exceptions are Arizona and New Mexico where the Indian and Mexican population changes the picture slightly.

that in every instance the rate for Negro men is much lower in these states than the mean, 27.2 per cent, for Negro men the country over.

These data are highly significant and to some degree encouraging. They show the blight that is cast on an area where syphilis is not controlled in the Negro

TABLE 1—Positive Serologic Tests for Syphilis

Age Group	White Men	Negro Men
21-30 years	10.0	12.0
31-40 years	11.0	21.0
41-50 years	12.0	27.0
Total for all ages	17	27

Negroes not only affects the Negroes but increases the rates in the white population as well.

The data indicate also that syphilis may be brought under some degree of control in the Negro as well as in the white. In Massachusetts and Rhode Island, for example, each with rates of 0.9 per cent for white men, one finds that the rates in the Negro population of young adult males are less than 12 per cent.

It was noted that the data show syphilis to be just as common in rural areas as in urban communities. These crude data do not tell the true story. The high prevalence of syphilis among rural Negroes distorts the picture. For example, Iowa and South Carolina are truly rural states—both have populations of about two million, with no large cities. But Iowa selects had a syphilis rate of 1.7 per cent, those from South Carolina 14.5 per cent. The reason for this is that Iowa has a Negro population of 0.7 per cent and South Carolina one of 43 per cent.

Thus the syphilis problem in the United States at the present time centers in the high prevalence of the disease in the Negro. This is true of all parts of the nation but is particularly true in those cities and states with preponderantly large Negro populations. All comparisons that are made concerning syphilis, comparisons of one city with another or one state with another or comparisons that are made of the United States with other nations, must take into account this high prevalence of syphilis in the Negro and proper statistical correction made on a race population basis.

For example, comparisons of syphilis prevalence in the United States with the Scandinavian countries, with Great Britain or with other European nations are not

TABLE 2—Five States with Highest Syphilis Prevalence in Negro Men as Indicated by Serologic Tests

State	White Men	Negro Men
1 Florida	5.3%	40.6%
2 Texas	5.3%	34.3%
3 Georgia	3.9%	32.8%
4 Maryland	2.8%	32.2%
5 Mississippi	3.5%	32.1%

valid unless the data that are presented are truly comparable. When so interpreted it becomes clear that, in our white population, we have a syphilis rate that compares favorably with any nation in the world.

These data show that most of the popular propaganda that has been used in promoting syphilis control in the United States has been highly misleading. "One person in ten will have syphilis" is a popular saying but

it is untrue. The incidence of syphilis among white men in the greater part of the nation is low and is limited for the most part, in the white race, to the lowest classes of society. Among the whites syphilis has become, in the great majority of cases, a disease of the ignorant, the careless, the criminal and the social outcast. It is truly a social disease.

From the point of view of the public health administrator, the issue is clean cut. He must attack the disease vigorously at the point of greatest prevalence. Since syphilis is more than ten times as prevalent in Negroes as in white persons, the administrator must make his plans to put at least ten times as much emphasis on control of the disease where it really exists in serious proportions and bend every effort toward control of the disease in the Negroes of his community. These efforts will result in a lower prevalence of the disease in the white people of the community as well.

There has been a tendency in official health circles to gloss over or to ignore the high prevalence of syphilis in the Negro. We now realize that this policy has been a short sighted one. The epidemiologic facts are before us. There is no gainsaying their truth or minimizing their importance. The sooner that this truth is

TABLE 3—Five States with Lowest Syphilis Prevalence in White Men as Indicated by Serologic Tests*

State	White Men	Negro Men
1 Wisconsin	0.6%	15.7%
2 Minnesota	0.8%	14.2%
3 Massachusetts	0.9%	11.6%
4 Connecticut	0.9%	20.7%
5 Rhode Island	0.9%	9.2%

* New Hampshire 0.6 per cent, North Dakota 0.7 per cent, Utah 0.7 per cent and South Dakota 0.9 per cent had very low rates in the white men but the number of Negroes in these states is too few for valid comparison.

recognized and appropriate steps are taken to control the existing situation, the better it will be for the Negro race and for the public health of the nation as a whole.

1300 York Avenue

Photosynthesis—Since sunlight furnishes the energy required for the synthesis of carbohydrates, this process is known as photosynthesis. Other factors involved are chlorophyll and numerous plant enzymes. Since oxygen is given off and energy is stored, photosynthesis is a reducing and endothermic (heat requiring) process. Much time has been spent by numerous investigators to determine the series of chemical changes involved in photosynthesis. Because of the general occurrence of free glucose, together with the fact that it constitutes an integral part of plant disaccharides and polysaccharides, this sugar has been assumed by many to be the first carbohydrate to make its appearance in the photosynthetic process. The validity of such an assumption now appears doubtful in the light of studies in which radioactive carbon, as carbon dioxide, has been furnished green plants for use in photosynthesis. These studies indicate that a large molecule is the first product of photosynthesis and suggest that, in some plants at least, starch may be the precursor of simpler carbohydrates such as glucose and sucrose, rather than a product resulting from condensation of numerous molecules of simple sugar—Peterson, William H., Skinner, John T., and Strong, Frank M. *Elements of Food Biochemistry*, New York, Prentice-Hall, Inc., 1943.

Clinical Notes, Suggestions and New Instruments

AN UNUSUAL COMPLICATION OF THE INTRA-SPINAL USE OF IODIZED OIL

PAUL C BUCY M.D. AND IRVING J SPEIGEL M.D.
CHICAGO

Iodized poppy seed oil has been injected intraspinally in thousands of instances for the localization of intraspinal lesions. Apart from obvious disadvantages in some medical situations and mild transitory symptoms for a few hours to a few days immediately after its injection in a small percentage of the cases, its use has been remarkably free from any untoward results. In our experience, the intraspinal use of iodized oil has been so innocuous that one of us (P. C. B.) has repeatedly expressed the opinion that its use was not associated with any permanent undesirable effects and that in those few instances in the literature in which the development of symptoms was attributed to the use of iodized oil the case against the oil had by no means been established. Furthermore the study made by Marcovich, Walker and Jessico¹ at the University of Chicago while the Division of Neurology and Neurological Surgery there was under the direction of one of us (P. C. B.) substantiated that opinion.

Accordingly when the present case came under our observation and when the operation and postoperative course seemed definitely to establish the relationship of the iodized poppy seed oil to the development of symptoms or dysfunction of the spinal cord, we thought it necessary to record the case in detail.

REPORT OF CASE

History—F. F., an American man aged 36 married, a grocery clerk, was referred to the Neuropsychiatric Institute at the University of Illinois by Dr. E. L. Compere of Chicago because of weakness, stiffness and numbness of both lower extremities. Past and family histories revealed nothing of note. His present illness began some time early in 1935. At that time, the patient noted the onset of pain in the lower part of the back which was aggravated by strenuous exercise. As time went on he began to notice an occasional pain radiating down into both hips and the posterolateral aspect of both thighs and both legs. The pain was not aggravated by coughing or sneezing. He remembers neither numbness nor muscular weakness. The low back pain finally became so severe that he sought aid at a medical clinic. There spondylolisthesis was discovered and, in April 1937, a spinal fusion was performed at the fourth and fifth lumbar and the first sacral vertebrae.

After this operation the patient felt quite well. However, by the beginning of 1938 he began to have severe pain in the left hip radiating down the left thigh posteriorly. Since the pain continued, he was examined in the neurologic service of the same clinic in March 1938. There were no neurologic abnormalities at that time. Iodized oil was injected intraspinally by the lumbar route and the patient examined on the tilting fluoroscopic table. At this examination no obstruction or filling defect of the spinal canal was seen, but two large globules of oil became caught and remained at the level of the eighth thoracic vertebra. These are clearly seen in roentgenograms made at that time. Nothing further was done. There was gradual improvement in the patient's symptoms and by the end of 1938 he was almost entirely well and able to resume work as a grocery clerk.

About six months before admission to the Illinois Neuropsychiatric Institute on Feb. 23, 1942 the patient began to notice that both his lower extremities were becoming weak and stiff. About four months before admission the weakness and stiffness had progressed to such an extent that it became difficult for him to get about without using the walls and furniture for support. About this time he noticed that his lower extremities were becoming "numb" and that he could move about much more successfully if he watched the floor and his extremities while he walked. About four weeks before admission, the patient noticed a burning pain along the medial aspect of the right foot which came and went for varying periods of time until two weeks before admission, when the pain became continuous.

Examination—General physical examination revealed no pertinent findings beyond the well healed scars over the lumbosacral area and over the tibia. The cranial nerves and upper extremities were normal. The actual muscular weakness in the lower extremities was not pronounced, but there was a severe extensor spasticity with hyperactive tendon reflexes. Babinski's sign was present bilaterally. There was a fairly well sustained ankle clonus on both sides. All the abdominal reflexes were present but weak. Vibratory sense was decreased from the iliac spines downward, and position sense was decreased in the toes, the ankles and the knees. There was hypesthesia to light touch in the tenth to the twelfth thoracic dermatomes on the left side. The patient's gait revealed a moderate degree of spasticity and of ataxia which was accentuated when his eyes were closed. His body swayed when his feet were together and his eyes closed.

Roentgen examination of the lumbosacral area revealed evidences of the known spondylolisthesis along with irregular shadows representing iodized oil in the spinal canal. At the level of the eighth thoracic vertebra were two large globules of iodized oil slightly to the right of the midline (fig. 1). The position of these globules of oil did not change regardless of whether the patient was recumbent standing upright or placed with his head downward. The blood count and smears were normal and gastric analysis revealed the presence of free hydrochloric acid. The Kahn reactions of the blood and the spinal fluid were negative. There was 25 mg. of protein per hundred cubic centimeters in the spinal fluid. At the first lumbar puncture the initial pressure was 130 mm. of fluid. A sphygmomanometer cuff was placed around the patient's neck and the pressure kept at 60 mm. of mercury (blood pressure 130/80) for thirty seconds. Twenty seconds after the onset of this compression a slow rise of the spinal fluid pressure to 190 mm. occurred. When the jugular compression was released there was a slow return of the intraspinal pressure to 130 mm. which required five seconds to complete. Abdominal compression caused a rapid rise and fall of the intraspinal pressure.

It was felt, however, that further substantiation of the subarachnoid block was desirable, so an amyl nitrite test was

¹ Marcovich, A. W., Walker, A. E., and Jessico, C. M. The Immediate and Late Effects of the Intrathecal Injection of Iodized Oil. *J. N. A.* 10: 2247-2254 (May) 1941.

performed according to the method described in 1932 by Elsberg and Hare.² This caused the lumbar intraspinal pressure to rise from 58 to 90 mm. of fluid (fig. 2).

Operation.—On March 10 the lower part of the seventh, all of the eighth and the upper part of the ninth thoracic vertebral laminae were removed. The dura mater appeared

Fig. 2.—The response of the pressure of the fluid closed to inhalation of amyl nitrate. The solid line represents the reaction in a normal subarachnoid space. The broken line is the reaction in the patient under discussion. The latter represents an almost complete spinal subarachnoid block.

to be normal but the arachnoid membrane at the level of the eighth and ninth thoracic vertebrae was opaque and white. Lying beneath the arachnoid membrane was a cyst measuring approximately 1.5 cm. vertically, 1 cm. horizontally and 1 cm. anteroposteriorly (fig. 3). The posterior and lateral walls of this cyst were formed by the arachnoid membrane while the anterior wall was formed by the pia mater and the spinal cord. All but the anterior wall was removed. This cyst contained liquid iodized oil very similar in appearance to that material as obtained in glass ampules from the manufacturer. Below and a little to the right of this large cyst was a small firm yellowish nodule measuring 0.5 cm. in diameter. It was removed intact. All of the thickened arachnoid membrane was also removed. After all these tissues were extirpated it was seen that the spinal cord was slightly enlarged posteriorly immediately beneath the large oil-filled cyst and that the vessels on the posterior surface of the spinal cord were enlarged and tortuous. The dura mater was closed tightly and the wound sutured in the usual manner.

Microscopic Examination.—The material removed at operation consisted of collagenous tissue. It was delicate and fibrillary and appeared to be edematous. The nuclei were narrow and elongated. The tissue in no place resembled normal arachnoid membrane.

Postoperative Course.—Following the operation, the patient made an uneventful recovery, and the wound healed by first intention. He left the hospital thirteen days after the operation. Examination at this time revealed no change in the clinical findings except that ankle clonus was no longer present. The patient stated that he was able to walk around with greater facility than before the operation.

He was seen again on April 4. His gait was no longer ataxic but was still slightly spastic. The Romberg test was still moderately positive. The knee jerks were only slightly hyperactive, the left being more active than the right. Ankle clonus was present at this examination. Babinski's sign was no longer present. Vibratory and position sense were intact in the right lower extremity but almost entirely absent in the left.

He was seen again on May 1. He stated that his walking had steadily improved since he left the hospital. Examination revealed a normal gait. There was no swaying in the Romberg

position and he walked tandem without difficulty. Tactile sensation was everywhere normal. Vibratory and position sense were both practically intact. The knee and ankle jerks were still hyperactive but much less so than previously. Ankle clonus and Babinski's sign were absent.

COMMENT

It is obvious that this is no ordinary case. Ordinarily iodized oil descends to the bottom of the meningeal sac in the sacral region and there either remains free and fluid or becomes encysted. In either event it produces no more than mild transitory symptoms. Even in those cases in which it has become lodged in the intracranial cavity, demonstrable effects have not resulted.³

That a considerable quantity of the iodized oil became lodged at the level of the eighth thoracic vertebra and remained there over a period of several years in spite of the patient's activity is definite evidence that there was some preexisting lesion at that level, probably an arachnoiditis. Such a likelihood immediately raises the question as to whether the arachnoiditis alone might not be responsible for the symptoms which developed in this case. That adhesive spinal arachnoiditis alone might so involve the spinal cord as to produce such symptoms cannot be denied. Yet the complete absence of any symptoms or involvement of the spinal cord at this level prior to the introduction of the iodized oil, the known tendency for iodized oil to stimulate fibroblastic proliferation in the leptomeninges,⁴ and the fact that the patient made such a rapid recovery once

Fig. 3.—Drawing of the operative field with the dura mater open. A, the large cyst filled with iodized poppy seed oil and surrounded laterally and posteriorly by thickened arachnoid membrane. X, small yellow nodule containing iodized oil.

the encysted iodized oil was removed all point strongly toward the implication of the iodized oil as well as the preexisting arachnoiditis as causal factors in this case.

In view of the recent thorough discussion by Marcovich, Walker and Jessio¹ of the effects of the intraspinal injection of iodized oil, there is no occasion for a repetition of that discussion here

SUMMARY

A man aged 30 suffered from spondylolisthesis for which the lumbosacral spine had been fused in April 1937. In March 1938, because of the development of left sciatica, iodized oil was injected intraspinally. Fluoroscopy revealed that some of the iodized oil lodged at the level of the eighth thoracic vertebra and remained there. Late in 1941 progressive symptoms of involvement of the spinal cord developed at that level. On lumbar puncture in February 1942 an almost complete spinal block was found. At operation on March 10 two collections of encysted iodized oil in the subarachnoid space, and a very much thickened arachnoid membrane were found and removed. Within a few weeks after the operation the patient had made a nearly complete recovery.

CONCLUSIONS

From a study of this case, it is concluded that

1. This patient suffered from a localized adhesive arachnoiditis at the level of the eighth thoracic vertebra prior to the injection of the iodized oil.

2. This arachnoiditis caught and held some of the iodized oil, which in turn stimulated fibroblastic proliferation in the leptomeninges, thus increasing the arachnoiditis and resulting in dysfunction of the spinal cord.

3. Although the intraspinal injection of iodized oil is ordinarily an innocuous procedure, the existence of a lesion which retains the iodized oil in contact with the spinal cord may ultimately result in undesirable changes in the spinal cord.

COLD AGGLUTININS: A DIAGNOSTIC AID IN CERTAIN TYPES OF PRIMARY ATYPICAL PNEUMONIA

DOROTHY M. HORSTMANN, M.D.
Commonwealth Fund Fellow in Preventive Medicine
AND

HUGH TATLOCK, M.D.
Alexander Brown Coxie Memorial Fellow in Internal Medicine
NEW HAVEN, CONN.

The occurrence of autohemagglutinins or so-called cold agglutinins in high titer in the serum of patients with primary atypical pneumonia has been reported recently by Peterson, Ham and Finland.¹ These authors point out that the presence of true, reversible autohemagglutination may serve as a criterion for segregating some of the cases of primary atypical pneumonia. Although the test is not entirely specific, it would appear to have practical value in this part of the world since the only infectious disease in which the phenomenon has been described consistently is African trypanosomiasis.² Furthermore, autohemagglutination does not occur with any regularity in other clinical conditions, although it has been observed rarely in a few including lobar pneumonia.³

The present report is confirmatory of the observations made by Peterson, Ham and Finland and deals with the testing of the serums of 43 patients with primary atypical pneumonia for cold agglutinins.

Aided by a grant from the Fluid Research Fund, Yale University School of Medicine.

³ McCombs, R. P. and McElroy, J. S. Reversible Autohemagglutination with Peripheral Vascular Symptoms. *Arch. Int. Med.* 59: 107 (Jan.) 1937.

MATERIAL

The serums investigated were, for the most part, collected from patients in the New Haven vicinity during the winters of 1941-42 and 1942-43, a few samples (from 3 patients) were received from North Carolina in March 1943. All of the New Haven patients gave a characteristic history and exhibited

The titers of cold agglutinins in 27 cases of primary atypical pneumonia. Points represent 50 samples of blood taken on various days of the disease. The point with the arrow at the extreme right indicates a sample taken on the fifty-ninth day of the disease.

the usual physical and laboratory manifestations of primary atypical pneumonia.⁴ In every case there was positive x-ray evidence of pneumonitis. About half the patients had received sulfonamide therapy at some time during the illness. From 43 patients 84 blood specimens were collected at varying times in the course of the disease, 56 of these specimens had been stored in the ice box at 5°C for one to fourteen months. In addition there were 135 control serums representing normal persons, patients from the isolation unit of the New Haven Hospital and patients from the general medical and surgical wards.

METHOD

Agglutination tests were set up as follows. Dilutions of the patient's serum from 1:4 to 1:4,096 were made in 1 cc volumes. To each dilution 0.1 cc of a 2 per cent suspension of washed human red cells, group O, was added.⁵ The tubes were kept at 0°C overnight. Readings were made immediately after removal from the ice box and after the preparation had remained at room temperature for several hours. The second reading was made to ascertain whether the reaction was reversible at room temperature and therefore a true cold agglutination. Positive results were interpreted in graduations from 4 plus (a tight disk of red cells on inverting the tube three times) to 1 plus (a fine granular appearance on similar agitation).

RESULTS

All of the 135 control serums were negative for cold agglutinins, as were those from the 3 patients from North Carolina. In the 40 New Haven cases of primary atypical pneumonia positive reactions were found in 8 out of 9 patients whose serums were tested soon after bleeding and in only 19 of the remaining 31 patients whose serums had been stored before examination. The titers in the stored serums were strikingly lower than in the fresh specimens. This same difference was noted by Peterson, Ham and Finland who found negative reactions in a number of serums that had been kept for six months or longer; the discrepancy was thought to be related possibly to a loss of agglutinins on storage or to a difference in the disease.

⁴ Dingle, J. H. and Finland, Maxwell. Medical Progress. *Virus Pneumonias. II. Primary Atypical Pneumonia of Unknown Etiology.* New England J. Med. 227: 375 (Dec. 3) 1942.

⁵ Human autohemagglutinins are known to act as isocagglutinins. Group O red cells were used to avoid the usual in vitro reactions.

The accompanying chart indicates the relationship between the titers and the day of the disease on which the blood was collected. On this chart have been recorded samples of serum from 27 patients who gave at least one positive reaction. Patients who gave only negative reactions have not been included.

In general, the results indicate that in many cases of primary atypical pneumonia the rise in titer of cold agglutinins occurs about one week after the onset of symptoms and may persist for several weeks after recovery. In no case of our series did the test become positive before the eighth day, and the majority were positive during the second to the fourth week of illness. However, it should be pointed out that most of our material was not collected with cold agglutinins in mind, and in many cases only a single specimen was available. The serums are therefore too scattered and irregular as to time to allow definite conclusions.

The fact that all 11 North Carolina patients gave negative reactions on three satisfactorily spaced specimens examined soon after collection is important. It indicates that further tests are in order to investigate the possibility of different types of primary atypical pneumonia existing in various regions of the country.

In our limited series there appeared to be no clear-cut correlation between the titer of cold agglutinins and the severity of the disease. However, among the few very high titers were 2 severe cases in which hemolytic crises developed. In 1 of these recovery occurred, but the other terminated fatally. The latter case is of special interest.

REPORT OF CASE

M. L., a housewife aged 47 whose symptoms began Oct. 1, 1942, was treated for several days with sulfadiazine without effect and was admitted to the New Haven Hospital on October 8 with a temperature of 103.6 F and x-ray evidence of pneumonia in the left upper, the left lower and probably the right upper lobe. Her blood count on admission showed 10,000 white blood cells, of which 86 per cent were polymorphonuclear leukocytes, the hemoglobin was 12.5 Gm and the red blood cells numbered 4,400,000. During the eight days after admission her temperature varied between 102 and 105 F, and there was increasing respiratory embarrassment. On the sixteenth day of her illness there was a sudden hemolytic crisis in which the hemoglobin fell rapidly to 41 Gm and the white blood cells rose to 100,000. At the same time extreme autohemagglutination was noted even at room temperature, the clumping of red blood cells in the counting chamber made it impossible to make an accurate red cell count. The serum taken on the first day of hemolysis had a titer of 1:1,024 for cold agglutinins when tested after four months storage. There was definite hemoglobinemia and hemoglobinuria. The patient rapidly became moribund and died without response to emergency splenectomy. Autopsy revealed a diffuse bilateral interstitial pneumonitis with round cell infiltration and interalveolar exudate also composed largely of mononuclear cells. There was some reticuloendothelial and bone marrow hyperplasia and hemosiderosis of the abdominal organs, but no explanation of the hemolytic episode was found.

COMMENT

Although this patient had received sulfadiazine prior to admission to the hospital, none had been given for the nine days before hemolysis occurred. It is not known what part the drug played in the development of her anemia, but as far as the autoagglutination is concerned our series shows that this phenomenon occurs in high titer in patients with primary atypical pneumonia who have not received sulfonamide therapy.

SUMMARY

The presence of cold agglutinins has been noted in a group of New England patients suffering from primary atypical pneumonia. These results confirm those reported by Peterson, Ham and Finland and further suggest that this simple test may be a valuable diagnostic measure in some forms of this disease.

Council on Industrial Health

THE COUNCIL ON INDUSTRIAL HEALTH HAS RECEIVED THE FOLLOWING RECOMMENDATIONS FROM THE COMMITTEE ON OCCUPATIONAL DERMATOSES SECTION OF DERMATOLOGY AND SYPHILOLOGY, AMERICAN MEDICAL ASSOCIATION:
C. M. PETERSON, M.D., Secretary

RECOGNITION AND PREVENTION OF INDUSTRIAL DERMATITIS

WITH ADDITIONAL REFERENCE TO OIL DERMATITIS AND FOLLICULITIS

A REPORT OF THE COMMITTEE ON OCCUPATIONAL DERMATOSES, AMERICAN MEDICAL ASSOCIATION

HARRY R. FORSTER, M.D., *Chairman*

CHARLES C. DENNIS, M.D.	HIRSH E. MILLER, M.D.
JOHN G. DOWNING, M.D.	EDWARD A. OLIVER, M.D.
JAMES R. DRIVER, M.D.	EARL OSBORNE, M.D.
JOSEPH KLAUDER, M.D.	LOUIS SCHWARTZ, M.D.
C. GUY LANE, M.D.	MARION SULZBERGER, M.D.

The incidence of occupational dermatitis in our country has never been so great as at the present time, and the need for adequate prevention and control has never been more important. New industries, particularly those concerned with the war effort, have contributed many causative agents to industrial dermatitis. In old industries, where dermatitis was commonly observed, the step-up in industrial activities and the enrolment of new employees have resulted in a definite increase in dermatitis, particularly among men and women above and below the usual employment ages. In the accelerated program of the heavy industries, inflammation of the skin caused by cutting oils, lubricating oils and related compounds has been particularly prevalent and troublesome.

The Council on Industrial Health functions as a liaison between the various lay and medical groups concerned with the industrial dermatoses problem, and the practicing and consulting dermatologists, as represented by this committee. It is the intent of this committee to serve all groups in an advisory capacity and to act as pacemaker for individual dermatologists and industrial physicians by crystallizing dermatologic opinion on certain issues and by establishing basic formulas for the correct diagnosis and adequate management of occupational dermatoses. It seems pertinent, therefore, to review this subject at this time, even at the risk of some repetition, and to make certain pronouncements, even though they may appear dogmatic.

RECOGNITION

The recognition of an occupational origin may be quite obvious in some cases of dermatitis but very difficult to establish in others. The importance of establishing a correct diagnosis early in the course of dermatitis cannot be overemphasized, since it involves correct and adequate treatment and also determines questions of liability, disability and changes of work. The diagnosis and treatment of industrial dermatitis require adequate dermatologic knowledge and preferably the services of a dermatologist. Too frequently the latter is called too late, therefore, when dermatologic service is readily available it should be sought promptly.

The patch test is an important aid in the diagnosis of dermatitis but it is responsible for many errors, especially when relied on for diagnosis and when testing with primary irritants. Its chief value is in the investigation of dermatitis resulting from hypersensitivity to allergenic substances. Some pitfalls of "patch test diagnosis" may be avoided by careful and thorough history taking. To cite a simple example, a painter may present a dermatitis venenata and react positively to a patch test with turpentine, which is a primary irritant, yet his dermatitis may have resulted from exposure to poison ivy while rabbit hunting. It has been Osborne and Hallett's¹ clinical experience that persons presenting a state of hypersensitivity to a specific chemical substance which in full strength is a primary irritant will always give a positive patch test to a 10 to 1 dilution. Sulzberger and Rostenberg² have observed positive patch test reactions in 1/10,000 and even 1/100,000 dilutions and they state that the vehicle has an important bearing on reactions, depending on whether water, oil, alcohol, ether or acetone is used.

This committee is accumulating information on chemicals used in industry to determine their "thresholds of irritability" on normal skin and has specified that "the concentration which should be recorded as the primary irritating one of a chemical studied is that which produces a cutaneous reaction in the majority of persons tested." Information will be published on this important subject from time to time.

Because of their importance to the industrial physician and dermatologists we repeat here the definitions of primary irritants and sensitizing agents, and the criteria for diagnosis, as previously published by this committee.³ Familiarity with them is a basic requirement for a proper understanding of industrial dermatology but it implies likewise the need for an adequate knowledge of nonindustrial dermatology for proper evaluation and interpretation.

DEFINITION OF A PRIMARY SKIN IRRITANT

1 When a substance in a given concentration, in a given vehicle and after a given manner and length of exposure produces a clinically manifested irritation on the skin or a majority of persons not previously sensitized to that substance, then that substance is a primary irritant under the specified conditions.

2 The irritation may be redness, papulation, vesiculation, ulceration or other sign of damage at the site to which the irritant has been applied.

3 By contrast, substances which produce reactions only on the skin of persons who are hypersensitive to that substance are not primary irritants.

4 A sensitizing agent is one that increases the tissue capacity to react to subsequent exposure.

5 Hypersensitivity means having a greater capacity to react than the normal.

Limitations to such a definition are recognized because of numerous and complicated circumstances operating in determining the irritant action of a given substance. The following may be mentioned. The region of the skin surface exposed and the size of the area exposed

to the irritant. The physiologic state of the skin with reference to dryness, oiliness, perspiration, the degree of pigmentation. The general state of health, the emotional background and the influence of season, diet and actinic rays. The action of two substances in combination each of which alone does not exert an irritant action.

The fundamentals for the differentiation of occupational from nonoccupational dermatitis are clearly defined in the following "criteria for diagnosis," which were adopted by the committee³ from material previously published by Sulzberger, Lane and others.

1 The dermatologic diagnosis is a dermatosis in which the role of an occupational causal factor (major or contributory) has at some previous time been established beyond reasonable doubt.

2 The individual has been working in contact with an agent known to have produced similar changes in the skin.

3 The time relationship between exposure to the agent and the onset of the dermatitis is correct for that particular agent and that particular abnormality of the skin.

4 The site of the onset of the skin disease is the site of maximum exposure.

5 The lesions present are consistent with those known to have followed the reputed exposure or trauma.

6 The individual is employed in an occupation in which similar cases have previously occurred.

7 Some of the individual's fellow workers using the same agent are known by the examiner to have similar manifestations due to the same cause.

8 So far as the examiner can ascertain there has been no exposure outside occupation which could be implicated.

9 If the diagnosis is dermatitis, the following items are important:

(a) The evidence of previous attacks coming after exposure to an agent followed by improvement and clearing after cessation of exposure constitutes most convincing evidence of the occupational factor as a cause.

(b) The results of patch tests performed and interpreted by competent dermatologists corroborate the findings of the history and examination in the majority of cases.

It is realized that these criteria are difficult of application in certain groups of cases such as:

1 Sensitization cases.

2 Cases in which there is accentuation of existing skin disease by occupational factors.

3 Cases in which there are supervening complications of other dermatoses and occupational dermatoses.

4 Cases in which much time has elapsed between the development of the dermatoses and the examination.

5 Cases which have been overtreated.

A knowledge of sensitization dermatitis and of sensitizing or allergenic substances is of utmost importance and necessitates familiarity with the fundamental concepts of cutaneous allergy. Cases of occupational dermatitis due to an allergic type or acquired sensitiveness are less frequent than dermatitis resulting from exposure to primary irritants but they are likely to be more severe and more protracted and also prone to recurrence and prolonged disability. The investigation and treatment of such cases should be carried out by the dermatologist.

2 Rostenberg, Adolph Jr. and Sulzberger M. B. J. Invest. Dermat. 93 (June) 1939.

3 Industrial Dermatoses. A Report by the Committee on Industrial Dermatoses of the Section on Dermatology and Syphilology of the American Medical Association J. A. M. A. 115: 613-615 (Feb. 21) 1942.

removal of dirt when washing after work. Stearic acid 20, sodium carbonate 2, glycerin 6, water 78.

2. Ointments, emulsions or solutions of 'invisible glove' type, either water soluble or water insoluble, that leave a thin protective film of resin or wax on the skin. Because of the tendency of perspiration to loosen or remove the water soluble type, fats or oils may be added. The water insoluble resins or waxes require a volatile solvent for application and a special cleanser for removal, either of which may irritate the skin after frequent use. Possible irritant effect may be minimized by the application of a hydrous wool fat cream after work. This type of protection may be used on the face, especially when masks or respirators are worn. A: Acacia 5, tragacanth 5, borax 2, water 88 (water soluble glove). B: Gum benzoin 5, beeswax 2, anhydrous wool fat 5, ethyl alcohol 88 (water insoluble glove).

3. Ointments that fill the pores with a harmless fat protect against water soluble irritants and petroleum oils and to some extent against greases. Anhydrous wool fat 70, castor oil 30, with sufficient perfume. To facilitate the removal of this type of protective ointment, wetting agents may be added.

4. Protective ointments containing nonirritant chemicals to neutralize industrial irritants. Boric and benzoic acid are recommended to neutralize industrial alkali, soaps and magnesium hydroxide to neutralized industrial acids, and nonirritant oxidizers such as dichloramine 1 to detoxify vesicant gases. Magnesium carbonate 5, talc 5, soap 30, hydrous wool fat 90, castor oil 28, diponol 2, with sufficient perfume.

5. Protective ointments which permit inert powders to adhere to the skin and thus form a protective covering. This type of protection is recommended for exposures to allergenic substances such as the chemicals used in the manufacture of explosives and for protection against mechanical irritation of abrasives, particles of steel and glass and so on. Zinc oxide 5, talc 5, iron oxide 1, Irish moss 2, gum benzoin 2, water 10, alcohol 15, vanishing cream 60.

6. Protective applications against photosensitizing agents, such as the heavy coal tar and oil distillates. Hydrous wool fat 58, castor oil 30, titanium dioxide 5, menthyl salicylate 5, diponol 2, with sufficient perfume.

CLEANSING AGENTS

The need of adequate and proper cleansing of the skin to prevent dermatitis may seem too obvious to require discussion. It is important, however, and is ignored or not understood by many workers. Sometimes more cases of dermatitis result from improper cleansing than from the industrial exposure. The common practice of workmen to use the materials employed in their trade for cleansing purposes may provoke dermatitis. Painters use turpentine, machinists gasoline, printers kerosene, others alkaline wash powders.

The best cleanser is a mild toilet soap and plenty of warm water. Employers should insist on thorough washing of the hands, forearms and face at the end of the work day and at noon where chemical irritants are handled or disseminated as dust. Frequent changes of work clothes is a necessary corollary. The use of abrasive soaps and cheap bulk soaps is to be discouraged, and appropriate creams should be applied after washing when there has been exposure to solvents. Contaminated waste and rags used for wiping hands and fore-

arms are a source of dermatitis and skin infections. Soaps act as cleansing agents chiefly by emulsifying and dissolving the fats, oils and greases on the skin surface, and these and the dirt and chemicals adhering to them are then flushed off with water. Klauder stated that soap is not sufficiently soluble as customarily used to permit the alkaline salts to act as skin irritants, except after prolonged contacts, whereas soap powders, especially when containing sodium carbonate, may readily act as irritants. Coconut oil is a common ingredient of soap and may sometimes be a source of skin irritation and sensitization.

Schwartz⁷ states that "a normal industrial cleanser for general use should consist of a superfatted neutral toilet soap, containing a wetting agent or synthetic detergent. It should contain a minimum of free alkali and have a pH of 10 or less in a 1 per cent solution. It should not contain silica, quartz, pumice, feldspar, rosin fillers or organic solvents." The following formula is recommended: neutral toilet soap 30, bentonite 30, santomerse 10, hydrous wool fat 5, perfume 1.

Wetting agents lower the surface tension of cleansing liquids and thus increase their effectiveness as cleansers by facilitating their spread over the skin surface and by penetration of the pores. Wetting agents facilitate the removal of both oil soluble and water soluble skin contaminants. Sulfonated oils are important cleansers in industry for workers who have developed dermatitis or who may not tolerate soaps. Osborne prefers alkyl sulfonates to sulfonated oils as soap substitutes because of repeated observation of dermatitis resulting from the use of sulfonated oils. On the other hand, C. G. Lane observed less than 1 per cent positive patch tests to sulfonated oils in 350 patients and found this oil particularly helpful as a skin cleanser in eczematous cases and for workers intolerant to soap. Klauder and his associates selected formulas 10 to 13 for sulfonated oil cleansers.

OIL FOLLICULITIS AND DERMATITIS⁸

In our accelerated war program among the most prevalent and troublesome dermatoses are those caused by cutting oils, cutting compounds and lubricants. It is impossible for metal workers and machinists to operate without cutting oils and compounds, because these products are necessary to lubricate moving parts, to keep

⁷ O. Connell, W. J. Pub. Health Rep. 37:1773 (July 21) 1921.
Schwartz, Louis, *ibid.* 56:1947 (Oct 3) 1941.

the cutting edges cool and to prevent rust. The lubricating oils and greases are usually petroleum derivatives. The cutting oils may be of animal, vegetable or mineral composition or may be combinations of such oils. Animal oils, such as lard oil, are more satisfactory for this purpose than petroleum oils but they are much more expensive, while both animal and vegetable oils break down at high temperatures. Mineral oils also have less viscosity, mixtures of these oils are therefore most commonly used. Cutting oils are further subdivided into the straight or insoluble oils and the soluble oils or cutting compounds. The latter are sulfonated oils, soap oils and phenolated oils diluted with water in variable proportions. The sulfonated oils are produced by treating petroleum oils, castor oil, cottonseed oil or olive oil with sulfuric acid and neutralizing the excess acid with sodium carbonate, sodium hydroxide or an alkali. The soluble cutting oils are mixtures of sulfonated mineral oil and saponifiable vegetable or animal oils, which, when mixed with water, form creamy emulsions. Phenolic compounds and alcohol may be added to vegetable or animal oils to prevent them from becoming rancid and for sterilization. Sometimes the oils are sterilized by heat. The addition of sulfur or chlorine to vegetable or animal oils is thought by some to increase film strength and thus to increase lubrication of the cutting edges. Used oil may be reclaimed by sterilization and filtration, straining or centrifugation.

This brief description of cutting oils and mixtures will serve to indicate the potentialities for dermatitis and the desirability of information regarding the kind of oil being used when attempting to combat dermatitis. The opinion has been expressed that dermatitis of the venenata type may be caused by the sulfur or chlorine content, which may be as high as 5 to 10 per cent in some cutting compounds, or by the alleged defatting effect of some mineral oils. Klauder states that pure mineral oil, free of volatile distillates, does not have a "defatting" action. The fatty oils, which may total 30 per cent of a mixture, may consist of oleic acid, lard, fish or vegetable oils. Dermatitis venenata from such sources is, however, comparatively infrequent as contrasted with follicular dermatitis, papules, pustules, furuncles and comedones.

Phenols, cresols and phenolic amines present in small quantities as inhibitors, and the animal or vegetable oil components, may be the cause of sensitization dermatitis. The cleansers used after work with cutting oils may likewise be the cause of dermatitis, instead of the oil or one of its ingredients. The drying and cracking of the skin resulting from the defatting action of the mineral oil content may predispose to dermatitis from sources other than the oil. Cutting oil dermatitis of the allergic variety is usually a diffuse erythematous process associated with edema and later with desquamation, but it may exhibit fine vesiculation and at times papulation.

As already stated, the commonest type of skin disorder in this field is the folliculitis that follows plugging of hair follicles with oil or grease and dirt. This occurs particularly on the extensor surfaces of the hands and forearms and also quite frequently on the anterior surfaces of the thighs and knees. These skin surfaces are studded with little black dots, indicating the plugged follicles, and among them are scattered inflammatory papules and pustulopapules and occasional furuncles. Ordinary nonindustrial folliculitis and furunculosis do

not exhibit this profuse follicular plugging or the characteristic localization of folliculitis observed in the industrial cases.

Schwartz and Barlow⁹ have investigated and described an acneiform dermatitis similar to previously reported chloracne and attributed by them to chlorinated cutting oils. These lesions are chiefly on the face and neck of workers exposed to a fine oily mist produced in heavy cutting and grinding operations. In a single large motor factory with 20,000 employees, 100 cases of dermatitis a month were observed over a six month period shortly after a change had been made in the gear cutting oils used for certain operations. Most of the cases were instances of oil folliculitis and furunculosis of the extremities but they included numerous instances of acne-like facial eruptions, exhibiting the straw colored cystic lesions observed in chloracne. Microscopic examination showed follicular hyperkeratosis and pseudocystic dilatation of follicular openings. Similar cases were observed in several other factories using the same gear cutting oils at similar operations. The offending oils were petroleum oils containing fatty animal oils in combination with 5 per cent chlorine and 6 per cent sulfur, which is a higher percentage of chlorine than in most chlorinated oils. Investigation disclosed also that about 25 per cent of the chlorine was given off in the grinding operations. A return to the oils previously used resulted in a prompt subsidence in the incidence of these eruptions.

Some oils stimulate keratinization and cause the formation of horny plugs, keratoses and papillomas. Epithelioma formations may occur but are rare. Fine metal particles in used oil and in cotton waste and rags may scratch and abrade the skin, predisposing to both dermatitis and infection. The infection, which is staphylococcal or streptococcal, is usually acquired from shop dirt and cleansing rags and clothing or by auto-inoculation and is less frequently attributable to the oils and cutting mixtures.

The prevention of cutting oil dermatitis and folliculitis is chiefly a matter of personal cleanliness of skin and clothing, and this can be facilitated by the provision at work of adequate washing facilities, showers and clothes lockers and by instruction of employees in the importance of their use. At certain types of work sleeves and aprons of material impervious to oil may be worn. If individuals with abnormally dry skin must be kept at such work a protective application of a hydrous wool fat and castor oil mixture may be applied before work. Schwartz, Warren and Goldman¹⁰ recommend aprons and sleeves treated with oil resistant synthetic resins and the use of a skin cleanser of neutral sulfonated castor oil containing 2 per cent fatty alcohol sulfate. Two per cent trisodium phosphate and sodium hexametaphosphate may be added to this mixture for additional cleansing and water softening properties. If protective ointment or creams are desired it is best to use preparations made with vegetable or animal fats that will not act as "degreasers" and containing wetting agents to render them more easily removable by soap and water.

THE MENACE OF TYPHUS IN EUROPE

Of the communicable diseases that may become epidemic in wartime, typhus is of most concern. In his comprehensive summary of the typhus situation in Europe and North Africa, Biraud¹ of the Epidemiological Intelligence Service Health Section of the League of Nations points out that typhus is on the increase in the countries of eastern Europe in which the disease usually is endemic, in Spain and in North Africa, and that it has appeared in sporadic forms in regions of central and western Europe hitherto free from the disease. In eastern Europe typhus is not as widespread as at the end of the first world war. In the West Biraud does not regard the danger of typhus serious "so long as the population continues on the whole to be free from lice," but increasing economic disorder and destitution may result in spread of the disease.

The spread of European typhus, which is the only form of typhus now considered, depends on the presence of the virus and its vector, the body louse, in a receptive population. The special means to prevent the invasion and extension of typhus are delousing and vaccination. In delousing, the people who are most exposed to the infestation come first—vagrants, refugees, the poor—but under certain conditions delousing of military as well as civilian communities may be required.

Biraud has made a valuable study of the respective advantages and indications of antityphus vaccines, killed and live. Generally speaking, killed vaccines, which are given in three injections a week or so apart and which act rather slowly, are best suited for the protection of medical and sanitary personnel and in limited outbreaks in regions where the population in general

is stable and free from lice, in other words, when rapid protection is not required. But in outbreaks in shifting and lousy populations, in troops and refugees, live vaccines are best because protection is quickly induced by a single injection. In endemic regions preference should be given, if possible, to vaccines of multiple local strains of the virus, in countries free from typhus but threatened, it would be best to use vaccines of virus from the regions whence the invasion may be anticipated. Biraud states that as regards live vaccines "the new method of Blanc (biliated flea virus) and that of Langret-Durand (mouse brain virus) are the only ones that can be considered in the preparation of vaccines intended for Europeans." With both these methods quantities needed for mass vaccination can be produced and both have given good results in the suppression of epidemics in North Africa. Mass vaccination broke the typhus waves in Morocco in 1937-38 and in Tunis in 1939-40. In Tunis, where 200,188 vaccinations were made with the mouse virus, not a single case of vaccinal typhus was observed. Biraud concludes that modern antityphus vaccination coupled with delousing can protect Europe against the present menace of epidemic typhus. From reports at hand it appears that so far American military forces in North Africa have escaped typhus, which is still a menace to the civilian population.

SULFONAMIDE FASTNESS

Three years ago Woods² suggested that acquired resistance of pathogenic micro-organisms to sulfanilamide is due to their acquired power to synthesize unusually large amounts of p-aminobenzoic acid, a metabolic product known to inhibit sulfanilamide activity. This theory could not be verified experimentally at the time because of the lack of a reliable quantitative test for the minute quantities of p-aminobenzoic acid formed by pathogenic bacteria. Since then Landy and his colleagues³ at the Army Medical School, Washington, D. C., have developed a microbiologic technique for such determination. They have applied the new technique to a study of p-aminobenzoic acid synthesis by sulfonamide resistant micro-organisms³.

Two different strains of *Staphylococcus aureus* were made resistant to sulfonamides by exposure to increasing concentrations of sulfathiazole. The adapted strains, together with the nonresistant parent cultures, were

2 American Soldiers Escape Typhus, J. A. M. A. 122: 236 (May 22) 1943.
3 Woods, D. D. Brit. J. Exper. Path. 21: 74 (April) 1940.
2 Landy, Maurice, and Dicken, Dorothy M. J. Biol. Chem. 110: 109 (Nov.) 1942.
3 Landy, Maurice, Larkum, N. W., Oswald, Elizabeth J., and Streightoff, Frank. Science 97: 265 (March 19) 1943.

then transferred serially to a p-aminobenzoic acid free culture medium.⁴ Plate cultures revealed an equal proliferation of the adapted and parent strains in this medium. Equal inoculums of the four cultures were then transferred to 50 cc volumes of p-aminobenzoic acid free medium. The subcultures were then incubated for twenty-four hours and afterward passed through a Sertz filter. After autoclaving, the resulting filtrates were titrated for p-aminobenzoic acid by the Landy technic with parallel crude assays by routine colorimetric methods, crystalline p-aminobenzoic acid being used to prepare the color scale. The average p-aminobenzoic acid formed by the two sulfonamide susceptible parent strains was 0.049 microgram per cubic centimeter. The sulfonamide resistant strains synthesized an average of 3.61 micrograms per cubic centimeter, a seventyfold increase over the p-aminobenzoic acid synthesis by the susceptible parent cultures. The quantity of p-aminobenzoic acid synthesized by the adapted cultures is thus considerably in excess of the minimum amount required to suppress the inhibitory action of the quantity of sulfonamide to which these organisms are resistant.

Sulfonamide adapted staphylococci continue to synthesize this seventyfold excess of p-aminobenzoic acid for many generations after transfer to usual culture mediums. The seventyfold synthesis occurs both in the absence and in the presence of sulfonamides. The acquired sulfonamide fastness is thus a stable hereditary character in these adapted micro-organisms.

Landy and his colleagues believe that development of ability to synthesize excessive amounts of p-aminobenzoic acid fully explains the acquired sulfonamide fastness of staphylococci. With other bacterial species, however, acquired sulfonamide resistance is not associated with such increase. Nonresistant parent strains of *Escherichia coli*, *Vibrio cholerae*, *Bacterium dysenteriae* and *Klebsiella pneumoniae*, for example, secrete on an average only 0.033 microgram per cubic centimeter, the same average being shown by sulfonamide resistant variants of the same species. The latter result is of particular clinical interest, since it shows that a successful method of overcoming the sulfonamide fastness of staphylococci would not necessarily be effective with other pathogenic bacteria. The method of "resensitizing" or overcoming sulfonamide resistance in staphylococci by the use of urea, for example, which was recently proposed by Tsuchiya and his colleagues⁵ at the University of Minnesota, would not necessarily be effective with other bacterial species.

Current Comment

COLOR BLINDNESS

In *THE JOURNAL* for March 20 reference was made to an alleged cure for color blindness said to have been devised by one J. H. Lepper, optometrist, of Mason City, Iowa. Subsequent to the publication of that statement, Lepper sent to *THE JOURNAL* a communication in which he insisted that he does control color blindness in from fifteen to twenty days so that boys who followed his methods passed government tests. He submitted complete instructions as to the technic that he uses, some special lenses which are used as a part of the procedure, and a list of men now in the Navy and in the Air Force who had previously been rejected but were accepted after having followed his technic. The material concerned was referred to appropriate agencies in Washington, which verified the information supplied by Lepper as to the men who had been rejected and later accepted following his attention. Investigators then visited certain optometrists in the eastern part of the United States who follow the Lepper technic and studied their results. These investigators believe that Lepper is conducting an educational rather than a therapeutic process. In his technic the subjects are instructed to get some one with normal color vision to assist them and to trace the shapes of the figures carefully even in those charts in which they can see the figures fairly well. They are instructed to continue working on harder and harder charts and to keep daily records of the charts which they can read and those which they cannot read. Thus the person concerned builds a learning curve and with sufficient time masters the color manual thoroughly. It seems quite likely that those with disturbances of color vision do fix in their minds appearances which are associated with certain colors when viewing objects that have for them some familiarity. No doubt reexamination of these individuals at a later date, using a different technic, would reveal that the persons concerned are still color deficient, although they did learn enough about the test ordinarily used to pass that test and thus enable them to enter military service. Obviously it is for the services themselves to determine whether or not the tests for color blindness now used are sufficient, in view of the possibilities of learning, to screen out enough persons who are color deficient or whether or not the young man who is willing to put in the necessary time in an educational process to learn enough about the tests to enable him to pass them would not qualify because of superior learning ability or intelligence to meet the needs of the armed forces. The optometrists who are now specializing in the Lepper technic might limit their promotion of the method to the statement that they teach men to pass the tests for color vision and avoid carefully the use of the word 'cure' in any relation to color blindness.

OSGOOD NUMBER OF ARCHIVES
OF SURGERY

The May 1943 issue of the Archives of Surgery is dedicated to Dr. Robert B. Osgood, professor emeritus of orthopedic surgery at the Harvard Medical School. Dr. Osgood has been closely associated with developments in orthopedic surgery and in arthritis since 1899. He has a host of former students and friends, many of whose contributions appear in this special number. This timely recognition is a well merited testimonial to the ideals which have animated a long and useful career in medical science.

"SYPHILIS IN THE UNITED STATES
PRIMARILY A NEGRO PROBLEM"

Elsewhere in this issue appears an article by W. C. Smilie of the Department of Public Health and Preventive Medicine, Cornell University Medical College, which emphasizes the fact that the incidence of syphilis among white men in the greater part of the United States is low and that it is limited for the most part to the lowest classes of society. Thus it has become among the whites a disease largely of the ignorant, the

Leading causes of rejection at Selective Service local boards November 1940 through September 1941 (chart supplied by the Selective Service System)

careless, the criminal and the social outcast. Syphilis is, however, more than ten times as prevalent in Negro as in white persons. Smilie feels that emphasis should be placed on the high prevalence of syphilis in the Negro and that the attack on the disease should be guided by this factor. In recent studies of the 18 and 19 year old registrants, figures were assembled which indicate that the rate of incidence of syphilis among whites for

each hundred examined was 0.2, while for the Negro the rate for the 18 and 19 year old group was 11.2 per hundred examined. Thus for the Negro group syphilis ranked second, following an incidence of 12.2 for educational deficiency, whereas in the white group syphilis does not appear in the first ten causes of rejection.

TRUE AND FALSE AMNESIA

As used medically, the term amnesia means temporary rather than permanent loss of memory. Three main causes or types of amnesia, according to Lennox,¹ may be recognized—pathologic, physiologic and feigned. Pathologic amnesia is used to cover those cases in which the amnesia is associated with and presumably caused by abnormal structure or physiology of the brain. This would include amnesia caused by such agencies as sudden injury, acute toxemia, excessive use of narcotics and alcohol. Epilepsy is the medical condition in which periods of amnesia most frequently occur without apparent warning. The types of epileptic seizures sometimes known as psychic, psychic equivalent, psychic variant, fugues, automatisms, paroxysmal mania or epileptic insanity are frequently the most difficult to identify because previous manifest attacks have been often absent. Psychologic amnesia is due to a disturbance of normal psychologic processes or reactions. It arises most often out of some emotional blockage. Unlike the epileptic patient who expresses concern, chagrin and bewilderment over a past period of amnesia, the psychoneurotic seems little perturbed by the fact that all memory is gone. Occasionally amnesia is simulated in an effort to escape some unpleasant duty. In cases of feigned amnesia the identifying features of pathologic and psychologic amnesia should be absent, a normal electroencephalogram is presumptive evidence against a plea of epileptic amnesia. In addition to the electroencephalogram, the recently developed use of phenytoin sodium may provide a therapeutic diagnostic agent of considerable aid in the cause of justice whenever the claimed amnesia is related to a criminal act. This drug is of proved value in the control of psychomotor seizures. If unexplained acts of violence with amnesia are in the nature of epileptic seizures, the successful use of this drug would tend to establish the cause of the behavior and might alter the prospects for long term imprisonment. As pointed out by Lennox, however, the electroencephalogram has certain limitations—about 15 per cent of epileptic patients have a normal brain wave record and about 15 per cent of normal persons have an abnormal brain wave record. Even though this is true, in those cases in which an illegal act is the result of a period of amnesia which in turn is accompanied by a disorder of the electrical waves of the brain, treatment by means of medicine instead of by incarceration seems reasonable. More information on this point, Lennox says, is urgently needed.

1. Lennox, W. G. Amnesia—Real and Feigned, Am J Psychiat 99:732 (March) 1943.

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on War Participation of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war and such other information and announcements as will be useful to the medical profession

ARMY SPECIALIZED TRAINING PROGRAM FOR MEDICAL AND PREMEDICAL STUDENTS

At present it is contemplated that training in medicine, dentistry and veterinary medicine will be initiated in all approved schools by July 14. The dates correspond as far as possible to the beginning of a new term except in the schools in which an academic period starts after July 15 in these cases it is asked that the program be initiated at the first of the month.

Baylor University School of Medicine is being omitted until further notice, as is the Harvard School of Dental Medicine (in contradistinction to the Harvard Dental School).

Students in these schools who are called to active duty or are inducted through Selective Service will be assigned with the least possible delay to the unit at the school in which currently enrolled. Preprofessional students who have completed their preparatory training and who have been accepted for matriculation by approved schools are considered as professional students. They will not be required to accomplish their basic military training at the expense of their professional training.

Other preprofessional students however with the exception of those in the Enlisted Reserve Corps and those who enter the Enlisted Reserve Corps through induction prior to the end of their current term which ends prior to June 30 1943 must receive their basic military training prior to assignment to the Army Specialized Training Program if they are inducted later. Since this three month interruption of preprofessional training may mean incomplete preparation for the vacancy for which accepted by an approved school full advantage in these cases should be taken of eligibility for deferment under Selective Service. If at the completion of their academic preparation they are inducted either before or after entering medical school they will be assigned to the unit at the school by which accepted.

Instructions have been issued which will place the responsibility of getting the soldier who requires no more premedical training to the unit at the school by which he has been accepted on the service command commander and the dean of the accepting school. Complete information regarding accepted matriculants will enable the local service command to issue the necessary orders to effect timely assignment of enlisted men residing or stationed in his command to the appropriate unit. He will also request the transfer to the unit in his command from other service commands if necessary.

Medical schools have not yet been asked to mortgage vacancies in the freshman classes to the Army Specialized Training Program. It is hoped, however to negotiate such assurances for late 1944 if premedical training of enlisted men other than those already accepted is to be undertaken. The Army will want 55 per cent of freshmen vacancies the Navy 25 per cent.

The decision of the Navy that all its medical and dental trainees will receive commutation of quarters and rations complicates the situation as does the fact that Navy trainees will wear double breasted blue sack suits while the medical student in the Army is clothed in khaki. No one complains that the Navy will not permit its bachelors to acquire a dependent.

The question of quarters and rations is causing great distress among many deans. The present ruling is that Army Specialized Training Program trainees at schools of dentistry medi-

cine and veterinary medicine will be placed on commutation of rations and quarters when it is manifestly impossible for each institution concerned to provide from its own resources or by lease or contract adequate housing and messing facilities. This puts the entire local problem in the hands of the service command and the dean.

There is a wide variation in textbooks and instruments required. The Army will purchase them through the institution for reissue as required. Tuition is being considered on the basis of nonresident tuition. Various fees such as matriculation and graduation will not be covered the soldier must pay for his own diploma. Breakage is a government responsibility and, if due to neglect or misconduct will be deducted from the soldier's pay.

Questions and Answers

Q How may medical or dental students who are now deterred by Selective Service get into the Army Specialized Training Program? **A** Students in good standing in accredited medical or dental schools who are now deterred by Selective Service may request reclassification and voluntary induction by their local boards for the purpose of induction and assignment to the Army Specialized Training Program. At the time of induction, such students should have in their possession letters from the deans or their colleges certifying that they are medical or dental students in good standing. If they are inducted in this manner before the end of the current term they will be transferred to the inactive reserve and not ordered to active duty until the end of the current school year at which time it is expected that the Army Specialized Training Program will be operative.

Q How may premedical or predental students who have been accepted for admission to accredited medical or dental schools and who are now deterred by Selective Service get into the Army Specialized Training Program? **A** Prior to the end of the current term not later than July 1 1943 the procedure will be the same as outlined for medical or dental students. Those who enter the Army through Selective Service after July 1 will be required to take thirteen weeks of basic military training before they are eligible for assignment to the Army Specialized Training Program.

Q What will be the status of premedical or predental students who are not enlisted reserves by July 1? **A** Students not in any Army or Navy Reserve by July 1 may (1) be inducted by Selective Service as just suggested in which case they must be prepared to interrupt their college work for basic military training or (2) be continued under deferment by Selective Service until they are medical students at which time they may be inducted and assigned to an Army Specialized Training Program unit to continue their professional training without the necessity of interruption for basic military training.

Q Will resignations of Medical Administrative Corps commissions for purposes of induction and assignment to the Army Specialized Training Program be accepted after May 1? **A** No time limit has been set for such resignations or enlistments. They will be accepted at any time.

Q When, where, and how will students who resign Medical Administrative Corps commissions enlist? A Instructions regarding enlistment are being made by the respective service commands. If such instructions have not been received by the students inquiry concerning them should be made without delay.

Q Will recommissions of Medical Administrative Corps commissions be approved for the purpose of enlistment in the Navy College Program? A No.

Q Will subsistence allowances be made to medical students on active duty on the Army Specialized Training Program? A Only in situations in which it is impossible or impractical to provide group housing and/or necessity. No blanket authorization has been issued for the provisions of subsistence allowances. Each request by a medical or dental school for subsistence allowances for its students will be considered as a special case.

ALLIED PAPUAN MEDICAL SOCIETY

(The society met, when it met, in November)

With principal discussions centering around medicine as it is applied and practiced in connection with aviation members of the Allied Papuan Medical Society held their regular monthly meeting here recently. The society, now in its fifth month, includes in its membership all doctors of this area. Hosts for the meeting were flight surgeons of the various Air Force units. Special guests included commanding officers of all Allied Air Force units and nurses from the states of the Australian and American hospitals.

Speakers were introduced by Lieut. Col. Reynolds D. Smith, president of the society, and topics with speakers included 'Aviation Medicine in Combat' by Col. Percival I. Wilson, 'Moral Factor' by [censored] Keith Harrison, 'Fear by [censored] C. P. Mirkle, 'The Fighter Pilot' by [censored] I. H. Grammer and 'Medical Air Service' by [censored] B. A. Donnelly.

The speaker's rostrum was flanked by exhibits which covered almost every phase of aviation medicine assembled and displayed for the occasion by the medical departments of the Air Corps units represented. Of particular interest was a military exhibit which graphically presented the life cycle of mosquitoes common to this area. Microscopes were set up for study of the minute details and live fish of the genus *Gambusia* were on exhibit in decorative tanks.

Striking a comparison between Japanese and Allied equipment was a complete display of Japanese surgical instruments and appliances with many of their drugs and much of the first aid equipment used in combat zones. All items were displayed on the brightly colored and highly decorated cloth used by the Japanese to baffle the natives. A portable x-ray machine, complete which can be disassembled, placed in small packing cases and transported in a medium sized plane, was demonstrated. Included in the display was a complete flight surgeons examining unit. Group and squadron aid stations were shown, plus latest type crash trucks and rescue paraphernalia. Conveniently placed for inspection near the "auditorium" was a C-47 transport converted into a hospital ship. Also shown were various types of oxygen tanks and masks, field oxygen equipment, jungle parachutes, back packs and scots containing one man collapsible boats. Lending realism to a display of the different types and sizes of bombs were actual photographs of their destructive powers.

The March monthly meeting had as its topic "Scrub Typhus." The subject for May will be "War Surgery."

To the doctors in the United States we extend a cordial welcome.

FIVE PHILIPPINE OFFICERS GRADUATE AT CARLISLE BARRACKS

Among 408 medical department officers who graduated from the Medical Field Service School at Carlisle Barracks, Pennsylvania, on April 8, 5 were from the Philippine Islands. Major Emigdio C. Cruz, a member of President Quezon's staff, and First Lieuts. Gregorio P. Chua, Francisco J. Roman, Irmeo E. Pantangco and Jose Willic, the first 3 of whom served with the American Red Cross in the Philippines and helped bring out from Manila on a Red Cross hospital ship 246 wounded, when these officers arrived in California they were commissioned in the U. S. Army Medical Corps.

ARMY

GENERAL SIMMONS TO LECTURE ON PUBLIC HEALTH AT YALE

Brig. Gen. James S. Simmons, chief of the Division of Preventive Medicine in the Office of the Surgeon General, has been appointed visiting lecturer in public health by Yale University School of Medicine, New Haven, Conn., for the coming year, the War Department announced on May 22. This will be in addition to his Army duties. General Simmons is also visiting lecturer in preventive medicine at the Johns Hopkins University Medical School, Baltimore. Known principally for his work in bacteriology and preventive medicine, he has conducted laboratory and field investigations on malaria, yellow fever, typhus meningitis, typhoid, encephalitis and other diseases. General Simmons received his doctor of philosophy degree from the George Washington School of Medicine in 1934 and his doctorate in public health in 1939 from Harvard University. He is a member of the National Malaria Committee, the Medical Division of the National Research Council, the Committee on Medical Research of the Office of Scientific Research and Development, the Advisory Council to the Health and Sanitation Division of the Institute of Inter-American Affairs and the Health Committee of the Office of Foreign Relief and Rehabilitation.

NURSES' AIDES FOR ARMY HOSPITALS

Volunteer nurses' aides trained under the joint program of the Office of Civilian Defense and the American Red Cross may now be used in army hospitals. The Surgeon General of the Army has requested this service, and the sponsoring agencies have recommended that Nurses' Aides be assigned to army general or station hospitals on request of the commanding officer of the hospital. The aides must receive their training in civilian hospitals as heretofore, however, and service in army hospitals must not interfere with supplying aides to civilian hospitals and health agencies both now and in the event of enemy action, according to Medical Circular No. 28, issued by Dr. George Bachr, Chief Medical Officer, Office of Civilian Defense. This proposed extension of the services of nurses' aides emphasizes the need for increased effort in recruitment in localities which have not yet participated in the program.

RATINGS OF ENLISTED MEN

The following War Department radiograms are quoted in part:

"All enlisted men finally selected for assignment to advanced courses Army Specialized Training Program will be assigned thereto in grade. Enlisted men finally selected for assignment to basic courses, Army Specialized Training Program, will be assigned thereto in grade 7."

"All students accepted from civil life, under the present plan, will be enlisted men (privates) while participating in the Army Specialized Training Program. Enlisted men holding ratings and accepted for advanced courses at Army Specialized Training Units must accept a reduction to qualify for the training. Those who accepted a reduction in grade will be restored immediately to the grade held at the time of selection without loss of seniority. Restoration to grade is not retroactive for pay purposes."

NAVY

CIRCULATING LIBRARY OF MOTION PICTURES

A circulating library of medical motion pictures has been established by the Section of Audio-Visual Education, Division of Preventive Medicine. Bumed in cooperation with Training Film Unit of Buac is sponsoring the production and procurement from outside sources of motion pictures and film strips of interest to naval medical personnel. Since it is impossible to furnish copies of these films to all naval activities for their film libraries, prints of films are being forwarded to the commandant of each naval district. District medical officers are required to arrange for routing and scheduling the films in their district. Fleet medical personnel temporarily ashore will be afforded an opportunity to see the films, as no method of distribution to the fleet seems feasible at present. A list of medical films now available may be obtained on request to Comdr J S Barr of the Section of Audio-Visual Education, Bureau of Medicine and Surgery, U S Navy Washington D C

SHORTEN NAVY TRAINING COURSES

A new educational program for the Navy Hospital Corps, designed to standardize and shorten all training courses, has been prepared by the Bureau of Medicine and Surgery. The increasing tempo of the war has greatly expanded the demand for members of the Hospital Corps, who serve aboard ships at sea, in continental and overseas hospitals and with Marine units. The new training program will enable the Corps to provide fully qualified men more rapidly.

Training for members of the Hospital Corps is divided into two classifications: basic training for men with no previous professional training and advanced courses for men of professional experience. The basic training period has been cut from a normal peacetime length of four months to a course of five weeks. The advanced course for officers has been reduced from one year to six months while advanced courses for enlisted personnel have been shortened from one to three months depending on the subject.

While the revised training courses will require less time in the class rooms, thus permitting men to join the fighting units more quickly, they have been designed so that no essential training is omitted.

NAVAL MEDICAL CORPS NEWS

Edward A Strecker, M D, professor of psychiatry at the University of Pennsylvania School of Medicine Philadelphia, and president of the American Psychiatric Association and James E Paullin M D, professor of clinical medicine at Emory University School of Medicine Atlanta president of the American College of Physicians and President-Elect of the American Medical Association have been appointed members of the Board of Honorary Consultants to the Surgeon General of the Navy.

Lieut (jg) Chester L Guthrie USNR has reported to the Bureau of Medicine and Surgery and been assigned to the Office of Special Assistant to the Surgeon General. He will continue with the current conversion of files and other work on record administration problems in the Medical Records Section.

Capt Robert F Sledge MC USN reported to the Naval Medical School Washington May 7 as executive officer.

Ens Dorothy G Miller WV (S) USNR reported to the Bureau of Medicine and Surgery and has been assigned to the section of Legal Medicine in Division of P Q & M R.

Lieut Lawrence E Schuster MC USNR reported to the Bureau of Medicine and Surgery and has been assigned to P Q & M R.

Lieut (jg) Hazel M Grainger W-V (S) USNR, reported to the Bureau of Medicine and Surgery and has been assigned to the dispensary.

During the month of April 239 appointments of medical officers and officers in class H V(S) and W-V(S) coming under the cognizance of the Bureau of Medicine and Surgery were accomplished.

Over 100 lieutenants (jg), MC V(G), USNR who have completed nine months of intern training in civilian hospitals

have been assigned to duty in naval hospitals for an additional period of three months of intern training prior to becoming available for general assignment.

The Hahnemann Medical College and Hospital of Philadelphia has been designated as an institution to which medical officers will be assigned for training in anesthesia. This is in addition to the facilities offered medical officers for training in this specialty at the Mayo Clinic, Rochester, Minn., and at the Lohry Clinic, Boston.

There are at this time 56 medical officers under training in psychiatry and neuropsychiatry at the Naval Hospital, Bethesda, Md., and at the Naval Hospital, Philadelphia.

The next basic indoctrination course of instruction at the Naval Medical School, Bethesda, Md. will be convened in the latter part of June for 40 lieutenants (jg), Medical Corps, U S Navy and U S Naval Reserve.

A large number of medical officers of the regular Navy and of the Naval Reserve have been placed under orders for the next classes being assembled at the Naval Air Station, Pensacola, Fla. for training in flight surgery and the course leading to the designation aviation medical examiner.

Medical officers who are interested in training in psychiatry, neuropsychiatry, pathology and laboratory procedures are urged to apply for such training.

LIFE INSURANCE FOR NAVAL PERSONNEL

It is now possible for all naval personnel regardless of date of entry into active service to apply for National Service Life Insurance without a physical examination. This opportunity will be available up to Aug 12 1943. Personnel of the Navy as a whole are insured only to the extent of about 85 per cent with a policy average of \$7,500. As this form of insurance coverage is for the benefit of each member of the naval service it is the desire of the Secretary of the Navy that every person be covered by the maximum amount of this insurance provided for them by act of Congress.

AUSTRALIA BUILDS HOSPITAL FOR CARE OF AMERICAN SERVICEMEN

According to the New York Times the Office of War Information reported that the government of Australia under its program of reciprocal lend-lease has built a ten story hospital for the use of American soldiers sailors and marines recuperating from wounds or illnesses suffered in the Pacific. The hospital was built at a cost of about \$3,000,000 but its transfer to the American forces entails no payment. The exact location of the center has not been revealed.

LIEUTENANT BERLEY A JAPANESE PRISONER

Mr and Mrs Guy Berley 4153 Congress Street, Chicago have been informed by the navy department that their son Lieut. Ferdinand Victory Berley, 30 years old a navy doctor is a prisoner in the Philippines. Lieutenant Berley had been reported missing since the fall of Corregidor. Earlier he had been stationed at Shanghai China and Cavite in the Philippines being transferred from a Cavite hospital only a day before Japanese bombs destroyed it. Lieutenant Berley graduated from Northwestern University Medical School in 1939.

THE NAVAL HOSPITAL FUND

Legislation has been proposed to abolish the time honored Naval Hospital Fund. The bill establishing the Naval Hospital Fund was signed by President John Adams on July 10 1798 the provisions of which authorized the familiar deduction of \$0.20 per month from the pay of officers and men of the Navy and Merchant Marine Service. Hearings before the Senate and House Committees on Naval Affairs have been held and both committees have acted favorably.

MISCELLANEOUS

WARTIME GRADUATE MEDICAL MEETINGS

The series of wartime graduate medical meetings under the auspices of the American Medical Association, the American College of Physicians and the American College of Surgeons has been previously discussed in *THE JOURNAL* (April 24, p. 159; May 1, p. 45). A series of tentative programs has already been prepared, each of them to consist of a six hour schedule or three two hour sessions.

The program on orthopedic surgery is under the direction of Dr. George F. Bennett and Dr. Frank D. Dickson who will serve as national consultants. The program will present the orthopedic features of diseases and injuries of the spine, deformities of the joints, shoulder lesions, the feet, knees and fractures.

The program on human nutrition and Nutritional Deficiency Diseases is under the direction of Dr. John B. Young. The program is to include the functions of various nutritive principles, the sources of nutritive principles and factors affecting intake and storage, and diagnosis and treatment of nutritional deficiency diseases.

The national consultant for tuberculosis is Lieut. Col. Esmond R. Fom. The program includes discussions of tuberculosis as a wartime problem, methods of examination, diagnosis and case finding, and evaluation of treatment and prognosis.

Allergy will be given under the direction of Dr. Robert A. Cooke. It is to include fundamentals of allergy, problems in diagnosis and treatment of bronchial allergy, asthma, miscellaneous allergies and nasal allergy including hay fever and perennial allergy.

The national consultant for malaria is Dr. Henry F. McInery. The program involves a review of the importance of malaria in world health and economy and in war, malarial parasites of man, clinical malaria and the epidemiology, prevention and control of malaria.

Gastrointestinal disease is to be given under the direction of Dr. Walter F. Palmer. The tentative first day two hours' program is to be devoted to peptic ulcer, its incidence, symptomatology, x-ray diagnosis, gastroscopy and treatment. The second day's program is to review the complications of ulcer and acute and chronic gastritis. The final two hours are to be devoted to nutritional digestive disorders and to diets for gastrointestinal patients in a military hospital.

The national consultants on clinical psychiatry are Dr. Edward A. Strecker and Dr. Arthur H. Ruggles. The tentative program will include selection of personnel at induction, neuropsychiatric problems during the training period and combat neuropsychiatric problems.

Cardiovascular problems will be under the direction of Dr. William D. Stroud. This tentative program emphasizes the desirability of each local committee arranging its own program according to the talent available, and the use of lantern slides and moving picture films when possible. A discussion of borderline physical findings in normal cardiovascular systems is suggested as desirable. Other suggestions include a discussion of neurocirculatory asthenia, the diagnosis, treatment and prognosis in coronary artery disease and peripheral vascular disease.

Rheumatism and arthritis have Dr. Ralph Pemberton as national consultant. The program is to include general orientation, clinical aspects of the principal varieties and discussions of treatment.

The national consultant for anesthesia is Dr. John S. Lundy. Consideration is to be given to fundamentals of anesthesia, inhalation anesthesia, including preliminary medication and intravenous, rectal, local, regional and spinal anesthesia.

Neurology is under the direction of Dr. Tracy J. Putnam. The subjects selected for discussion are neurologic examinations and principles of localization, laboratory aids in neurologic diagnosis and neurosyphilis, epilepsy and related conditions, multiple sclerosis and the encephalitides, the neuritides and tropical and exotic disorders of the nervous system.

General surgery has Dr. Irvin Abell as national consultant. The suggestions for discussion include appendicitis with its complications, hernias, peptic ulcer, intestinal obstruction, neurovascular lesions of the extremities, gas gangrene, skin grafting and the present status of sulfonamide drugs in the treatment of surgical lesions.

The national consultant for diagnostic roentgenology is Dr. Byrl Kuklin. The subjects suggested from which programs could be chosen include the chest, the gastrointestinal tract, the gallbladder, the osseous system and the nervous system.

Plastic and maxillofacial surgery is under the direction of Dr. Robert H. Ivy. The tentative program includes the definition and scope of plastic surgery, maxillofacial surgery, including a general plan of treatment of war injuries of the face and jaws, and fractures of the mandible, maxilla and other facial bones, involving methods of fixation by interdental wiring, splints, skeletal fixation, treatment of complications, such as nonunion by bone grafting, and the repair of contour defects.

Through arrangements by the headquarters of Wartime Graduate Medical Meetings, under the directorship of Dr. Edward J. Bortz, chairman, arrangements were made for Dr. Edwin L. Osgood of the University of Oregon Medical School and Dr. Lowell F. Coggeshall of the University of Michigan School of Public Health to speak for the graduate medical meetings for medical officers of the Canadian Army and Air Force and the United States Army held in the University of Alberta, Edmonton, Alberta, Canada, May 3 to 7. Dr. Osgood spoke on chemotherapy and Dr. Coggeshall on tropical diseases. Arrangements were made also for addresses at the meeting of the Georgia State Medical Association, May 13 and 14. The speakers included Dr. Everett I. Evans of the Medical College of Virginia, who spoke on general surgery, Dr. James H. Means of Harvard Medical School, who spoke on internal medicine, and Dr. Virgil P. Sydenstricker of the University of Georgia School of Medicine, who spoke on nutrition.

MATERNITY CARE FOR WIVES OF CERTAIN GRADES OF ENLISTED MEN

Under plans approved by the U. S. Children's Bureau and with funds already voted by Congress, maternity care for wives of men of certain grades in military service and medical and nursing care for their babies can now be provided without cost to the family. Under this plan a pregnant woman may receive antepartum care from a qualified physician either in the clinic or at his office, and at childbirth she and her baby may receive medical and nursing care whether she stays at home or goes to a hospital. Complete maternity care may be provided, including a final physical examination six weeks after the baby is born, and the baby may receive medical care during the first year of its life.

Twenty-three state health agencies are now authorized to provide maternity care for wives of men in the four lowest pay grades of the armed forces, and medical hospital and nursing care for their babies, both without cost to the family, the Children's Bureau of the U. S. Department of Labor announced on May 20.

States whose programs have been submitted and approved were listed by the bureau as Arizona, Arkansas, Connecticut, Delaware, Illinois, Indiana, Kentucky, Maine, Maryland, Michigan, Mississippi, Nevada, New Jersey, New Mexico, North Carolina, Oklahoma, Rhode Island, South Carolina, Utah, Vermont, West Virginia, Wisconsin and Wyoming.

In states providing these services, the wife and infant of any man serving in the fourth, fifth, sixth or seventh grade of the Army, Navy, Marine Corps or Coast Guard are eligible for care as long as similar services are not available through medical or hospital facilities of the Army or Navy or by or through official state or local health agencies. How much money the family has does not matter.

The forms for requesting such care are made available by the state health departments through local health and welfare agencies, local American Red Cross chapters, antepartum clinics, military posts and local practicing doctors of medicine. The wife fills out and signs her part of the application, including her husband's serial number, and her doctor completes the application and forwards it to the state director of maternal and child welfare or his authorized deputy. In an emergency, medical or hospital care may be given before an application is sent in. The state director of maternal and child health notifies the

patient and attending physician or clinic or the hospital whether or not the care is authorized

In the states providing these services, the maternity patients can expect complete medical service during the antepartum period, childbirth and six weeks after, health supervision for infants, nursing care in the home through the local health department, including bedside nursing care as necessary for the mother before, during and after childbirth, and for the baby during the first year of life, and hospital care in the wards or at lower rates for maternity patients and infants. The funds cannot be used in part payment for more expensive hospital accommodations. Hospital care may be authorized in any hospital, including Army and Navy hospitals where the maternity and pediatric services have been approved by the state health agency.

For further information about the program or in case there is no doctor within reach or it one does not know where to get an application form, write to your director of maternal and child health, state health department.

COMMITTEE TO STUDY FOOD NEEDS OF INVALIDS

A newly formed committee of physicians and specialists will assist in formulating broad policies for handling the special dietary needs of invalids and persons with specific diseases under the rationing program, the War Food Administration said on May 24. The committee was named by the National Research Council at the request of the Food Distribution Administration and Office of Price Administration. The special committee is studying (1) procedure for obtaining certification by physicians of invalids and persons with specific diseases requiring extra quantities of rationed foods, (2) qualifications of those who may certify as to these needs for extra foods, (3) the procedure of certification which will place a minimum burden on physicians and (4) diseases justifying extra allowances of rationed foods with specific determination of what foods and what quantities are necessary.

The committee which is the Subcommittee on Medical Food Requirements of the Committee on Drugs and Medical Supplies of the National Research Council also will advise the Office of Price Administration with respect to appeals from decisions of local rationing boards.

Members of the committee are Dr. William D. Stroud, professor of cardiology, Graduate School of Medicine, University of Pennsylvania School of Medicine; chairman, Dr. Clark W. Finnerud, assistant professor of dermatology, University of Illinois College of Medicine; Dr. Gilbert J. Levy, associate professor of pediatrics, University of Tennessee College of Medicine; Dr. Alton Ochsner, professor of surgery, Tulane University School of Medicine; Dr. Cecil Striker, secretary, American Diabetic Society; Dr. C. W. Munger, director, St. Luke's Hospital, New York; Dr. Philip S. Owen, former research assistant, Harvard Medical School, who will serve as technical aide; and Dr. Fred L. Adair, recently professor of obstetrics, University of Chicago Department of Medicine, who will serve as a liaison member representing the Medical Needs Division of the Food Distribution Administration. Dr. W. W. Palmer, professor of medicine, Columbia University College of Physicians and Surgeons, and chairman of the National Research Council's Committee on Drugs and Medical Supplies is ex officio a member of the Subcommittee on Medical Food Requirements.

SUPPLEMENTAL GASOLINE RATIONS FOR VICTORY GARDENERS

The Office of Price Administration has amended its mileage rationing regulations to provide up to 300 miles for victory garden travel if the car owner is regularly cultivating a tract of 1500 square feet or more devoted to the production of vegetables and if he cannot get to his garden any other way, his labor being necessary for the cultivation of the garden and provided that he arranges, if possible, to share his car with other gardeners to reduce the amount of additional mileage that will be necessary. When making application for a supplemental rationing of this type, gardeners should refer to Amendment 44 to Ration Order 50, effective April 30.

EFFECT ON GRADUATE NURSES OF THE "HOLD THE LINE" EXECUTIVE ORDER 9328 OF APRIL 8 AND THE REGULATIONS OF THE WAR MANPOWER COMMISSION OF APRIL 18

The War Manpower Commission, Washington, D. C., on May 18 stated that graduate nurses are subject to the terms of the executive order and the War Manpower Commission regulations in exactly the same way as other workers. Nursing is an essential activity. This means that in all War Manpower Commission areas:

1 Nurses may move as freely as before within the nursing profession, so long as the job transfer does not bring a higher salary or wage rate.

2 A nurse who is now employed in an activity other than an essential activity may accept a job in the nursing field at any salary or wage rate.

3 Nurses can transfer to new positions which bring a higher salary or wage rate only if they secure statements of availability from their present employers or from the United States Employment Service.

There is no prohibition in the order or regulation that would prevent any nurses from becoming members of the armed forces.

This is not a complete interpretation of the implications for nurses but simply highlights some of the main points. For information regarding any specific local situation, one should consult the local United States Employment Service office.

PUBLIC HEALTH UNDER HITLER

Das Spital, Bucharest, No. 62, 1942, contained an article by Dr. Musat and Dr. Rosu on the aspects and possibilities of surgery in field hospitals, stating inter alia that in the first six months of the war the authors, working in a field hospital in the front line, cared for 14,000 wounded, 4,000 of whom were operated on. The majority of the wounds were due to incendiary shell (bomb?) splinters (Brandgranatsplitter). Wounds caused by air bomb splinters and heavy air machine-gun bullets were very serious. Bullet wounds of the stomach were especially dangerous, the mortality rate being 65 to 70 per cent.

There is a "pressing" shortage of insulin in France, and the strictest controls have been applied to the remaining supplies of this valuable drug, according to an article in the Nazi controlled French newspaper *Action française*. The newspaper article as reported to the Office of War Information declared that there were shortages not only of raw drugs but also in phials and bottles. Lard, lanolin, petrolatum, cocoa butter and other materials used in the manufacture of hair pomade are so scarce that substitutes must take their place, the article said.

The *Pester Lloyd*, Hungary, of February 18 stated that the Luftwaffe medical service delegation under Hippke, which was to arrive in Budapest on February 21 and stay a week, included Surgical Adviser Chief Surgeon Major E. Gohrbandt, Chief Surgeon-Major Wilhelm Tonnies, adviser on brain surgery to the Luftwaffe, Chief Surgeon-Major Heinz Kalk, adviser on internal diseases and medical adviser to the Fuehrer, Capt. A. Schulz, Propaganda and Pressreferent of the Luftwaffe, Sanitary and Medical Service was also a member of the delegation.

According to the *Novi List*, Sarajevo, Yugoslavia, of February 7, owing to the fear of infection by spotted fever and abdominal typhus, the inhabitants of Visoko are being vaccinated on the advice of two local physicians who, however, have so much work in this connection that they cannot deal with everybody.

According to the Rumanian *Timpan* of February 18, the Ministry of Public Health has decreed a number of preventive measures against measles as more than half of all school children fall victim to it.

ORGANIZATION SECTION

OFFICIAL NOTES

RADIO PROGRAM AT ANNUAL SESSION OF HOUSE OF DELEGATES

Arrangements for radio broadcasts in connection with the annual session of the House of Delegates of the American Medical Association at Chicago have been partially scheduled.

The following programs have been scheduled for broadcasting by the National Broadcasting Company and Columbia Broadcasting System networks, the Blue Network, the Mutual Broadcasting System and local stations in Chicago:

WGN, 7 p. m. to 7:15 p. m. Central War Time. Committee of the American Medical Association on the War Doctor.

WGN, 8 p. m. to 8:15 p. m. Dr. George W. Kossak, New York. Medical and Civil Health in Wartime.

WHD, 10 p. m. to 10:15 p. m. Dr. Henry R. Victor, Boston. The Health of the War Doctor.

WBBM, 11 p. m. to 11:15 p. m. Dr. James E. Pugh, New York. Medical and Civil Health in Wartime.

WIS, 11 p. m. to 11:15 p. m. Rear Admiral Harold W. Smith, U. S. Navy. The Treatment of War Casualties.

WMAQ, 11 p. m. to 11:15 p. m. Dr. W. W. Bauer, Chicago. The War Doctor.

Additional programs are in process of being scheduled but arrangements were not completed in time for this announcement.

Station WIS, Chicago, beginning on June 3 and closing on August 19.

Members of the headquarters staff of the American Medical Association will be interviewed by Mrs. June Merrill of the WIS staff. WIS broadcasts on a clear channel at 890 kilo cycles and has an effective service range covering a radius of approximately 500 miles from Chicago. The audience is predominantly rural and the programs are limited to simple, practical suggestions which can be carried out in daily practice.

DOCTORS AT WAR

Radio broadcasts of Doctors at War by the American Medical Association in cooperation with the National Broadcasting Company and the Medical Department of the United States Army and the United States Navy are on the air each Saturday at 5 p. m. Eastern War Time (4 p. m. Central War Time, 3 p. m. Mountain War Time, 2 p. m. Pacific War Time). An exception is the Chicago area, where the broadcasts are heard by transcription at 10:30 p. m. Saturdays over Station WMAQ.

The titles and guest speakers for the last two programs are:

June 12: "Doctors for Tomorrow."

Speaker: Brig. Gen. Fred W. Rankin, M. C., A. U. S. President of the American Medical Association.

June 19: "Report to America."

On this program will appear two Army medical officers broadcasting by short wave from two foreign theaters of war, one Navy officer broadcasting from a foreign theater and one Navy officer broadcasting from a home base. The names of these officers and their locations are not divulged in advance for military reasons. For the same reason, their subjects will not be announced.

"SUMMER HEALTH HINTS" ON THE AIR

With the completion of eighteen broadcasts under the title "Before the Doctor Comes" this series will terminate and will be replaced by a new series of broadcasts entitled "Summer Health Hints." Tentatively twelve broadcasts are scheduled for Thursday afternoon at 2:15 p. m. Central War Time over

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status—H. R. 149 has been reported to the House providing that for the purpose of the Federal Food, Drug and Cosmetic Act nonfat dry milk solids or defatted milk solids shall be considered to be the product resulting from the removal of fat and water from milk and containing the lactose, milk proteins and milk minerals in the same relative proportions as in the fresh milk from which made. Such solids must contain not over 5 per cent by weight of moisture and a fat content of not over 15 per cent by weight unless otherwise indicated. H. R. 2664 has been reported to the Senate, providing for the training of nurses through grants to institutions.

Bills Introduced—H. R. 2726, introduced by Representative Beckworth, Texas, proposes to authorize for each fiscal year a sum sufficient to enable each state to furnish financial assistance to needy incapacitated adult individuals. H. R. 2739, introduced by Representative Jenkins, Ohio, proposes to establish a Food Administration in the Department of Agriculture. H. R. 2820, introduced by Representative Rogers, Massachusetts, provides for the establishment of a permanent medical corps in the Veterans' Administration to constitute a component

part of the military forces of the United States. This corps, it is contemplated, will consist of the following members: (a) physicians and dentists—1 surgeon general with the temporary rank of brigadier general, 132 officers with the rank of colonel, 201 with the rank of lieutenant colonel, 500 with the rank of major, 800 with the rank of captain and 1,200 with the rank of first lieutenant; (b) nurses and other personnel—1 superintendent of nurses with the rank of lieutenant colonel, 15 officers with the rank of major, 125 officers with the rank of captain, 400 officers with the rank of first lieutenant, 5,000 officers with the rank of second lieutenant and such other commissioned, noncommissioned, enlisted personnel and civilian employees as may be deemed necessary by the Administrator of Veterans' Affairs. The Medical Corps, it is proposed, will include such female professional and other female technical personnel as the Surgeon General of the corps with the approval of the Administrator deems practical. The rates of pay and allowances, increases of pay, transportation of property, retirement benefits and other gratuities and privileges for commissioned and enlisted personnel of the corps will be identical with those provided for personnel of corresponding rank and status in the United States Army. The establishment of a Medical Reserve Corps is contemplated by this bill.

STATE MEDICAL LEGISLATION

Alabama

Bill Passed—S 35 passed the senate May 19. It proposes the creation and establishment of a four year school of medicine in the state to be under the sole management ownership and control of the Board of Trustees of the University of Alabama and to be known as 'The Medical College of Alabama'.

California

Bills Enacted—A 327 has become chapter 407 of the Laws of 1943. It amends the health and safety code relating to the licensing of clinics, dispensaries and maternity hospitals by exempting therefrom a hospital corporation organized and operated exclusively for charitable purposes and any teaching or educational institution exempt from income taxation under the federal revenue acts. A 1175 has become chapter 530 of the Laws of 1943. It amends the business and professions code by requiring an applicant for a license to practice medicine to prove that a diploma from an approved school has been issued him and if the application is for a reciprocity certificate that the granting of a diploma was a condition precedent to his admission to the examination for the license on which his application for reciprocity is based. A 1659 has become chapter 732 of the Laws of 1943. It amends the business and professions code by requiring vendors of prophylactics to renew their licenses annually.

Connecticut

Bills Passed—Substitute for S 484 passed the house and the senate May 19. It proposes to amend the law relating to the labeling and sale of drugs by, among other things, exempting from such regulations the sale of salves, ointments, lotions and powders and other preparations designed and intended solely for external use and containing sulfanilamide or any compound or derivative thereof. Substitute for H 312 passed the house May 14 and the senate May 19. It proposes that the commissioner of health shall, on request, furnish medical hospital, nursing, obstetric and pediatric care to wives and to infants under the age of 1 year of men serving in the armed forces of the United States, when such wives are unable to secure proper care for themselves or for such infants. Substitute for H 1026 passed the house May 14 and the senate May 18. It proposes to authorize a court in certain cases to order an examination of the accused to determine whether or not he is suffering from a venereal disease and if so to make such order with reference to the continuance of the case or the detention, treatment or other disposition of the person as the public health and welfare requires such examination to be conducted at the expense of the state. Substitute for H 1312 passed the house April 28 and the senate May 11. It amends the law relating to the practice of chiropractic by eliminating therefrom the existing requirement that chiropractors show satisfactory evidence at the time of the annual renewal of their licenses that they have attended at least one of the two day educational programs conducted by the Connecticut Chiropractic Association Inc. the subjects of such programs being under the supervision of the state board of chiropractic examiners.

Bills Enacted—S 259 has become chapter 243 of the Laws of 1943. It amends the law relating to the practice of natureopathy by authorizing the granting of certificates without examination to persons who have been in active and continuous practice of natureopathy in any other state in which he was licensed to practice natureopathy for three years immediately preceding the date of his application if he meets the educational and other requirements provided for in the existing law except that an applicant for such certificate after his discharge from the armed forces of the United States must show that he had engaged in the practice of natureopathy for three years immediately preceding the date of his induction into such armed forces. S 262 has become chapter 216 of the Laws of 1943. It authorizes persons formerly licensed to practice physiotherapy but now retired from active practice or living outside the state to resume practice in the state by merely notifying the state department of health and paying the required registration fee. S 264 has become chapter 213 of the Laws of 1943. It requires physiotherapists to renew their licenses annually. H 716 has

become chapter 234 of the Laws of 1943. It amends the law relating to physiotherapy technicians by repealing the existing section setting forth qualifications for registration of physiotherapists without examination.

Florida

Bills Introduced—S 301 proposes an appropriation of \$20,000 to provide for the vocational rehabilitation of disabled persons who are physically incapable of earning a livelihood but whose disabilities appear to be amenable to treatment or surgery and could be removed or materially diminished to the extent that such persons would then be physically able to engage in remunerative employment. S 540 proposes that it shall be unlawful for any person to act as operator, driver or attendant in any ambulance at the time said ambulance is rendering service to the public without first having procured a current first aid certificate showing that the said person has passed both a standard and an advanced course in first aid. Substitute for H 146 prohibits a physician or surgeon from disclosing information acquired by him in attending any of his patients except under certain designated circumstances, one of such circumstances being whenever it shall be ascertained and determined by an order made and entered in the cause pending by the judge or one of the judges of such court after such notice to the patient as may be directed by the said judge that such testimony is necessary for the determination of the issues made in the cause and cannot be obtained in any other manner and that in the absence of such testimony the ends of justice may be defeated. The proposal further provides that its terms should extend to all duly licensed physicians and surgeons no matter what school of medicine they may follow or under what statute or law they are permitted to practice in the state.

Bills Passed—S 239 passed the senate April 26. It proposes to require every physician attending a pregnant woman to take or cause to be taken, a sample of blood of such woman at the time of the first professional visit or within ten days thereafter such blood to be sent to a recognized laboratory for a serologic test for syphilis. H 480 passed the house May 10. It requires every person making application for a license to marry to furnish a certificate from a duly licensed physician stating that the applicant has been given such physical examination including a standard serologic test, as may be necessary for the discovery of syphilis and that the applicant is not infected with syphilis in a communicable stage. The proposal would exempt from the above requirement an applicant who is in the military service of the United States and would limit the fee of the physician making the examination and issuing the certificate to \$1.

Bills Enacted—S 41 was approved May 12. It amends the natureopathic act by, among other things, (1) increasing the course of study in an approved natureopathic school from three to four years eliminating the prior requirement that no two of such courses may be given in the same year, (2) requiring natureopaths at the time of the annual renewal of their license, to present satisfactory evidence that they have attended the two day educational program conducted by the Florida Natureopathic Physicians Association Inc. or its equivalent, (3) providing for the termination of a license to practice natureopathy in the event that the holder thereof fails to renew said license annually and (4) requiring the registration of natureopathic licenses with the state board of health. S 366 was approved May 19. It requires the payment of an annual license tax of \$10 by any person, firm or corporation engaged in the manufacture, processing and dispensing of lenses for the correction, relief or protection of the human eyes and their appendages, the manufacture, processing, fitting and dispensing of frames therefor without however engaging in the diagnosis of the human eyes and the determination of the refractive powers of the human eyes or prescribing of lenses or treatment for human eyes.

Illinois

Bills Introduced—S 402 to amend the dental practice act would authorize licensed dentists to employ or engage the services of other persons or corporations to construct or repair extraorally prosthetic dentures, bridges or other replacements for a part of a tooth but makes it unlawful for such person

so employed or engaged to advertise other than in trade journals or publications and then only in the prescribed manner. H 701 proposes to include within the duties of the department of public welfare the inspection, investigation and licensing of nursing homes for the care of persons suffering from physical diseases, the term "nursing homes" not to include hospitals. H 729, to amend the hospital lien law, proposes to extend the privileges thereof to hospitals maintained and operated entirely by a county.

Massachusetts

Bills Introduced—S 191 proposes to authorize the board of registration in nursing to examine and register as a registered nurse any applicant who is 20 years of age and examine and license as an attendant any applicant who is 19 years of age during the existing state of war. Such applicants, however, would be required to comply with the other pertinent provisions concerning the registration of nurses. H 1655 proposes to authorize expenses for medical, hospital and other services rendered to aged persons which remain unpaid at the time of such persons' commitment to an institution or at death to be paid directly to the person furnishing such service. H 1716 proposes to amend the premarital examination law by authorizing physicians registered or licensed to practice in any other state of the United States to execute the required certificate.

Missouri

Bills Introduced—S 165 proposes the enactment of an enabling law relating to and providing for the licensing, regulation, examination, supervision and dissolution of corporations engaged in the furnishing of medical expense indemnity or service or hospital expense indemnity. Among other things the proposal would provide that medical expense indemnity or service shall consist of reimbursement or indemnity for medical or surgical care or service or the furnishing of same by or through duly licensed physicians for nursing service and of furnishing necessary appliances, drugs, medicines and supplies. Hospital expense indemnity or service shall consist of reimbursement or indemnity for hospital care or the furnishing of same through a hos-

pital or group of hospitals organized, maintained or operated by governmental or private interests as regularly recognized or authorized by the laws of the state.

Ohio

Bill Enacted—H 145 was approved May 20. It provides that the holder of an expired license or certificate from the state of Ohio to practice any profession, which has not been renewed because of the service of the holder thereof in the armed forces of the United States, shall, on presentation of satisfactory evidence of honorable discharge within six months of such discharge be renewed by the issuing board without penalty and without reexamination.

Texas

Bills Enacted—S 67 was approved May 6. It amends the law relating to the sale of narcotic drugs by providing, among other things that any person may purchase at any time 1 ounce of paregoric without a doctor's prescription. H 343 was approved May 6. It amends the law relating to the operation of nonprofit hospital service corporations by a new section relating to the expenses of such corporations and the investment of the funds of such corporations. H 651 was approved May 17. It authorizes a county to erect, equip and operate a hospital for the care and treatment of the sick, infirm or injured and to levy and collect a tax for such purposes.

Wisconsin

Bills Introduced—S 380 proposes to provide treatment for any physical or mental disease or injury which is directly or indirectly traceable to military or naval service to any man or woman who performed active duty in the military or naval service of the United States and received an honorable discharge therefrom. A 665 proposes to authorize a licensed nurse in another state to be granted a certificate in Wisconsin without examination if her credentials of general and professional educational qualifications are equivalent to those required in Wisconsin.

MEDICAL ECONOMIC ABSTRACTS

DEATHS OF SCHOOL CHILDREN

The death rate during the school age (5-14) is less than at any other age period and has declined almost 75 per cent during the present century according to a special report of the Bureau of the Census, April 13, 1943. In 1900 the rate was 3.9 and in 1940 1.0 per thousand in the registration area, which was expanding during that period to include several states with a higher than average mortality.

The decline would have been far larger had it not been for the great increase in accidental deaths and especially those from motor vehicles, which were almost nonexistent in 1900 but which had become the most important cause of accidental mortality in 1940. There is, however, some reason for encouragement in the fact that since the national program for safety education in the schools was inaugurated in 1922 there has been a decline of 15 per cent in motor accidents to school children.

The leading causes of death in 1940 were

Accidents	28.8 per cent
Influenza and pneumonia	9.0 per cent
Disease of the heart	8.0 per cent
Appendicitis	8.0 per cent
Tuberculosis	5.5 per cent

The greatest reduction was in the diphtheria death rate, which ranked first in 1900 with a rate of 69.7 per hundred thousand but by 1940 had dropped in rank order to the twelfth place with a rate of 1.7 per hundred thousand. "This decrease of 97.5 per cent in the diphtheria rate," says the report, "may well be considered one of the greatest triumphs in the control of communicable diseases by the concerted application of preventive and therapeutic measures."

Rheumatic fever throws a growing shadow on the picture. It seems to be increasing in frequency and, while it "has a low

fatality rate at the first attack," it often "produces permanent handicaps and has a high fatality rate for its recurring attacks." However, life expectancy for the "school age child was about five or six years longer in the fourth decade of this century (1930-1939) than in the first decade."

HANDICAPPED WORKERS

An analysis of the active file of the United States Employment Service in Ohio on January 16 showed that 1 out of 12 of 89,177 applicants registered for employment was physically handicapped. Eighty-six per cent of these were men and one fifth were skilled workers. Fifteen per cent had limb impairments, with an additional 11 per cent who had lost some portion of their limbs through amputation. Over one half were 55 years of age or older and two thirds had no education beyond the grammar schools.

Employment service managers estimated that only 3 per cent of those handicapped "had excellent prospects of being placed locally within the next sixty days. Prospects were considered good for about one fifth and fair for somewhat more than one half." More than one fifth were considered virtually unemployable. As to rehabilitation, the report concludes that "Undoubtedly the employment prospects of many of these applicants would be enhanced by rehabilitation. The large number of hernias reported, for example, indicates that medical treatment would probably aid in improving their usefulness. For others, special training may be required. In this respect the handicapped have the same further disadvantage as many experienced workers currently entering the labor market. They may require different types of training, but the fact that they may lack experience on the job should not prove as formidable as in the past."

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

ILLINOIS

"Cosmic Ray" Sold in Health Devices—Three Chicagoans and a Danville couple were named on May 21 in indictments charging conspiracy and operation of a confidence game by allegedly selling "cosmic ray" tubes for \$300, the Chicago *Tribune* reported, May 22. Those indicted by a Vermilion County grand jury were George Erickson and I. B. Haviland, who gave their address as 30 North La Salle Street, Chicago, Robert E. Nelson, Chicago and Mr. and Mrs. George Brown, operators of a Danville health institute. John Allen, assistant state's attorney, said the defendants sold pencil-like tubes to the sick, claiming they were a "radioactive" development in healing. Allen said the tubes were analyzed and found to contain nothing that would produce radioactivity.

Chicago

Course on the Rorschach Test—Michael Reese Hospital offers a course on the Rorschach test June 7-11 under the direction of Samuel J. Beck, Ph.D. Emphasis will be placed on those less serious mental disturbances in which success in treatment is indicated. The course will be in session in two two-hour periods daily for five days. Communications should be addressed to the department of neuropsychiatry, Michael Reese Hospital.

Dr. Ole Nelson Named Medical Director of Cook County Hospital—Dr. Ole C. Nelson, assistant warden at Cook County Hospital and a member of the staff for more than twenty years, has been appointed medical director of the hospital. He succeeds Dr. Charles Marshall Davison, who resigned because of pressing personal duties. Dr. Davison, who will continue as chief of the surgical staff, had held the position since December 1939. It was reported that Dr. Nelson would probably consolidate the new position of medical director with his present position of assistant warden.

Five Pathologists Named to Coroner's Consulting Staff—The appointment of five pathologists to serve as 'dollar-a-year' members of the coroner's consulting staff was announced in the Chicago *Sun*, May 25. The new appointees are Drs. Otto Saphir, professor of pathology at the University of Illinois College of Medicine, James P. Simonds, head of the department of pathology at Northwestern University Medical School, Edwin F. Hirsch, associate professor of pathology at the University of Chicago School of Medicine, Paul R. Cannon, chairman of the department and professor of pathology at Chicago, and John F. Sheehan, chairman of the department of pathology at Loyola University School of Medicine. These physicians will serve with the group of four doctors headed by Dr. Karl A. Meyer, who act as consultants with the nine full-time physicians in the coroner's office in special cases.

The Koessler Fellowship—The Jessie Horton Koessler Fellowship of the Institute of Medicine of Chicago for the aid of research in biochemistry, physiology, bacteriology or pathology will be available on September 1. The stipend is \$500 a year with the possibility of renewal for one or two years. Only such applications will be considered as are approved by the head of a department in the fields mentioned or by the director of a research institute or laboratory in Chicago and which stipulate that the recipient of the fellowship shall be given adequate facilities for carrying out the proposed research concerning which full information is required in the application. Applications will be received up to July 1 and should be sent to Dr. Paul R. Cannon, 950 East 59th Street. Dr. Cannon, on the recent death of Dr. H. Gideon Wells, was appointed chairman of the Committee on the Jessie Horton Koessler Fund.

KANSAS

Members of State Board of Health—Gov. Andrew P. Schoepfel, Topeka, recently appointed Dr. Clyde D. Blake, Hays, past president of the Kansas Medical Society, as a member of the state board of health and reappointed the following members for additional terms: Drs. Forrest L. Loveland, Topeka; Harry L. Aldrich, Crary; Gilbert A. Leslie, McDonald; and George I. Thacher, Waterville.

Institute on Industrial Health—A wartime institute on industrial health was held in Kansas City on June 3 and in Wichita on June 4 under the auspices of the state medical society and the state board of health. Among the speakers was A. G. Hewitt, general manager of the Visking Corporation, Chicago; Dr. Floyd C. Beelman, Topeka; and Dr. Carl M. Peterson, Chicago, secretary of the Council on Industrial Health, American Medical Association.

MASSACHUSETTS

Honorary Degrees—At the recent commencement of Tufts College Medical School, held jointly with the Tufts College Dental School, Boston, the honorary degree of doctor of laws was conferred on Dr. Lewis H. Weed, professor of anatomy at Johns Hopkins University School of Medicine, Baltimore, and chairman of the division of medical sciences, National Research Council, who delivered the convocation address on "War Research in Medicine and Dentistry." Comdr. Albert Warren Stearns, M.C., U.S. Naval Reserve, dean of the medical school, who is now in active service, and Dr. Frank R. Ober, Boston, received the honorary degrees of doctor of science.

Journal Dedicated to Dr. Lancaster—The *American Journal of Ophthalmology* for May was designated the Lancaster Testimonial Issue to mark the eightieth birthday of Dr. Walter B. Lancaster, Boston. Dr. Lancaster is now in private practice after concluding two years as chief of staff of the Dartmouth Eye Institute and ophthalmic surgeon of the Mary Hitchcock Memorial Hospital at Hanover, N.H. In 1889 Dr. Lancaster graduated at Harvard Medical School, Boston, where he later served as a member of the faculty. He was chairman of the Section on Ophthalmology of the American Medical Association in 1928. He has been president three times of the New England Ophthalmological Society and in 1924 had the same office with the American Academy of Ophthalmology and Otolaryngology and in 1935 of the American Ophthalmological Society.

MICHIGAN

Institute on Public Health Economics—On May 10 a two-week institute on public health economics started at the new School of Public Health of the University of Michigan, Ann Arbor, and constituted a preview of the activities of the school of public health. The institute was devoted largely to a discussion of prepayment plans for hospital care and was provided for by a grant from the Rockefeller Foundation through the Committee on Research in Medical Economics, New York, and the faculty and guest speakers of the School of Public Health. Nathan Sinai, D.P.H., secretary of the faculty of the school, was in charge of the institute and the guest lecturers included Dr. Joseph W. Mountin, Washington; D.C., George St. J. Perrott, Washington; Michael M. Davis, Ph.D., New York; Clarence R. Kulp, Ph.D., Philadelphia; Dr. Albert E. Larsen, San Francisco; John R. Mannix, Detroit; Dr. Frederick D. Mott, Washington; D.C.; Clarence Rufus Roren, Ph.D., and Maurice J. Norby, Chicago; Louis H. Pink, LL.D., New York; and Dr. Henry E. Sigerist, Baltimore. The institute was attended by fifty-six students who came from all parts of the United States representing medical, public health insurance and governmental agencies. The work of the institute was divided into general sessions for all students and special courses in the field of management of prepayment plans, appraisal of community facilities and needs, statistics and accounting and personnel management. The new \$750,000 public health building is not ready for occupancy but is expected to be completed by July 1 (The *Journal*, June 27, 1942, p. 738). The building and its equipment cost \$750,000, \$400,000 being provided by the W.K. Kellogg Foundation, \$300,000 by the Rockefeller Foundation and \$50,000 by the National Foundation for Infantile Paralysis. The site was offered by the university. The recent institute is part of the school's program for continued education in the field of public health practice and related services. According to Henry F. Vaughan, Dr. P.H., dean of the school of public health, it is the intent of the school to broaden the program of instruction in public health economics. The curriculum is already being offered at graduate level embracing work to the degree of master of public health.

NEW MEXICO

Indian Registration—To secure more complete registration of births and deaths in the Indian reservation, hospitals and pueblos, the New Mexico Division of Vital Statistics initiated a program that will bring the importance of registra-

tion into the homes of many Indian families is possible. The work is being carried on by Miss I. Anne Amison, New Mexico field agent of registration and the visiting nurse of the Indian Service. Talks are given in the schools of each pueblo and in each creek kitchen explaining the importance of registration and given to the children to take home. The Indian give evidence of great interest and satisfaction, knowing that they are to be recorded with the state as well as with the Indian Service. According to the *Indianist*, this is a significant step in the promotion of registration. In the past the Indian certificates were sent to the offices of the Indian Service, and only a few were ever recorded in the state division of vital statistics.

NEW YORK

Prizes Awarded—The annual award of \$100 offered by the Taylor Instrument Companies for the best thesis on a medical subject was presented to Drs. Andrew Kerr Jr., Rochester General Hospital, and Robert F. Sevcik, resident in surgery at St. Mary's Memorial Hospital, Rochester. The title of Dr. Kerr's thesis is "Weight Gain in Pregnancy—Its Relation to Sex of Infant and Length of Labor." Dr. Sevcik's subject dealt with a permanent use of the sodium-male compounds and x-ray therapy in pyoderma. The two papers, although of different types, were of such equal merit that the judges felt that each deserved the full award but it was decided to divide the award equally.

New York City

Rehabilitation Service Center—The establishment of a rehabilitation center at Teachers College of Columbia University under the direction of Herbert B. Donner, Ph.D., has been announced. The program will start with the summer session and aims to rent the handicapped for active participation in industry. The center was established after nearly two years of intensive study and research into the problems of the disabled. The new program seeks to make available trained workers in the field of rehabilitation. It is pointed out that at present there were approximately only 500 workers in the United States properly qualified to do rehabilitation case work.

Leon Lascoff Dies—Leon Lascoff, Sc.D., pharmacist, holder of the Remington Honor Medal and a former president of the American Pharmaceutical Association, died May 4, aged 75. According to the *New York Times*, Dr. Lascoff never sold anything but drugs in his store. For more than thirty years he was a member of the New York State Board of Pharmacy, serving as president in 1916, 1920 and 1930. He was a trustee of the Columbia University College of Pharmacy and a founder and first president of the New York County Pharmaceutical Society. He was a founder and treasurer of the New York Veterin Drugists Association and for years had been prescription editor of *Drug Topics*.

OHIO

Radio Program "Your Health" Reopens—On June 19 Station WLW will reopen a second edition of the program "Your Health" which has been conducted for years by Dr. Carl A. Witzbach, health commissioner of Cincinnati, in cooperation with the Academy of Medicine of Cincinnati, the Public Health Federation and the Cincinnati Board of Health. The new series will be a revised presentation of the earlier presentations and will utilize Dr. Witzbach as a narrator interspersed with dramatic sequences.

Personal—Dr. John W. Wilce, Columbus, has been named to represent the Ohio State Medical Association on the state advisory committee on recreation and physical education, which is supervising the Ohio Physical Fitness Program for the state department of education. Mr. Richard A. Aszling, director of the bureau of public education of the state medical association since June 1939, has resigned to become director of public relations for the midwest region of the Borden Company with headquarters in Columbus. Dr. Chester W. Waggoner, Toledo, has been reappointed a member of the state medical board for a term ending March 18, 1950. Dr. Waggoner has just completed seven years on the board.

PENNSYLVANIA

Society News—Dr. Myron F. Metzenbaum, Cleveland, addressed the Western Pennsylvania Eye, Ear, Nose and Throat Society in Johnstown, May 20, on "Replacement of the Dislocated Lower End of the Cartilaginous Nasal Septum to Reestablish Normal Nasal Function and to Aid in the Normal Development of the Sinuses, Jaws and Teeth."

Philadelphia

Strittmatter Award and the Da Costa Oration—The twentieth annual Strittmatter Award of the Philadelphia County Medical Society was presented to Dr. Hubley R. Owen, director of public health of Philadelphia and chairman of the local defense council. It special ceremonies in the society's building May 19. Dr. Owen received the award, consisting of a scroll and gold medal for his achievements in both positions and in recognition of his former work as chief surgeon, medical division of the city department of public safety, which extended over a period of twenty-five years. On the same occasion Dr. Eldridge L. Hixon, John Rhea Burton professor of surgery at the University of Pennsylvania School of Medicine, delivered the nineteenth annual J. Chalmers Da Costa Oration on "Sart of Fracture Therapy."

New Fluoroscopes Installed at Pennsylvania Hospital—Two new x-ray machines have been installed in the University of Pennsylvania Hospital through funds given by William H. Donner, founder of the International Cancer Foundation, in memory of his son William H. Donner Jr. One, called a biplane fluoroscope because it enables examinations to be made in two planes, horizontal and vertical, will be used to locate such foreign bodies in the lungs as coins and safety pins. A timetable on the machine makes it possible to position a patient so that x-ray pictures can be made from any angle, even vertical without lifting or turning him bodily. The fluoroscopic assembly suspended from the ceiling and the examination table, riding on miniature trolley tracks across the revolving turn table constitute the only visible portions of the apparatus. All other parts are concealed behind a wall panel and under the floor. The second installation is a multiphase fluoroscope which will be used during the setting of broken bones. Designed to assure the perfect reattachment of fractures, the multiphase fluoroscope is suspended from the ceiling of an overhead trolley and counterbalanced for ease of movement. The mechanism can be swung into any position desired, but the x-ray beam remains pointed toward the fluoroscopic screen, hooded to shut out light, on which the fracture image appears. The Pennsylvania hospital has also installed a dark room for processing x-ray films on a mass production basis. The installations were effected by Westinghouse Electric & Manufacturing Company.

RHODE ISLAND

State Society Creates Executive Office—Mr. John E. Jurell, executive secretary of the Providence Medical Association, Providence, has been chosen to fill the new office of executive secretary of the Rhode Island Medical Society. Mr. Jurell will continue as executive secretary of the Providence group.

Industrial Health Institute—A Rhode Island Industrial Health Institute was held at the Narragansett Hotel, Providence, May 19, under the auspices of the Pawtucket Business Chamber, Providence Chamber of Commerce, Providence Council of Social Agencies, Rhode Island Medical Society, Rhode Island State Council of Defense and the Rhode Island Department of Health. Among the speakers were

Miss Doris R. McGowan, field representative, division of women and children, state department of labor, *The Problem of Women in Industry*

Dr. Charles P. Fitzpatrick, *Howard Emotional Manifestations of Fatigue in Industry*

Dr. James P. Deery, Providence, *Health Services Available to Industry in Rhode Island*

Hugo F. Zambardino, safety engineer, Travelers Insurance Company, Hartford, Conn., *Safety in Industry*

Thomas H. Bride Jr., state director, U. S. Employment Service, *Problems of Employing the Physically Handicapped and the Aged*

Comdr. Marion B. Sulzberger (MC), U. S. Naval Reserve, *Experiments on the Effects of Fiberglass on Animal and Human Skin*

Dr. Leroy U. Gardner and Thomas M. Durkan, chief chemist, *Trudeau Foundation both of Saranac, N. Y., Fiberglass Inhalation Tests*

Dr. John G. Downing, Boston, *Industrial Skin Diseases*

Dr. Ubaldo E. Zambardino, Wallum Lake, *Tuberculosis in Industry*

Dr. Hilary J. Connor, Providence, *Venereal Disease Control in Industry*

Oswald F. Hedley, surgeon, U. S. Public Health Service, addressed the luncheon session on "What the Average Plant Can Do to Have an Industrial Health Program."

WEST VIRGINIA

State Medical Election—Dr. Robert J. Reed Jr., Wheeling, was chosen president-elect of the West Virginia State Medical Association at its annual meeting in Charleston, May 17-18, and Dr. Robert J. Wilkinson, Huntington, was inducted into the presidency. Other officers are Drs. Harry G. Stuck, Bluefield, and Thomas G. Reed, Charleston, vice presidents, and Thomas M. Barber, Charleston, treasurer. Dr. Reed Jr. is the son of Dr. Robert J. Reed, Wheeling, who served as president of the association in 1919. A resolution was adopted at the meeting recommending that any physician who is a

resident of the state when he has finished his medical training, whether it be internship or residency who is called into the service of the armed forces of the United States and who is licensed to practice by the Public Health Council of West Virginia or the National Board, shall be eligible for membership in the society of the county of which he is a resident without the probationary period of practice and shall be exempted from payment of dues as long as he remains in active military service

GENERAL

Meeting of Radiologists—The annual meeting of the American College of Radiology will be held at the Palmer House Chicago June 6 under the presidency of Dr Byrl R Kirklin Rochester Minn. The Conference of Teachers of Clinical Radiologists sponsored by the college which will be held in conjunction with the meeting, offers the following program

Capt Charles F Behrens (MC) U S N Wartime Radiology in the Navy
Col Henry C Moehring M C U S Army University of Tennessee Army School of Radiology Wartime Radiology in the Army
Comdr Edward L Bortz (MC) U S N R Philadelphia Wartime Graduate Medical Meetings
Mr R H Myers Washington D C War Production Board Production and Allocation of X Ray Equipment and Supplies

Knudsen Medal Goes to Dr Sawyer—The 1943 W S Knudsen Award of the American Association of Industrial Physicians and Surgeons was presented to Dr William A Sawyer since 1919 medical director of Eastman Kodak Company Rochester, N Y for outstanding work in control of tuberculosis constructive contributions to a practical program of nutrition in industry and setting up a program of rehabilitation for handicapped workers in industry. The award established in 1938 by William S Knudsen then president of General Motors Corporation for 'the most outstanding contribution of the year to industrial medicine' was given to Dr Sawyer at a dinner of the association in Rochester May 26. Dr Sawyer who was born in Iowa graduated at the University of Pennsylvania School of Medicine Philadelphia in 1913.

International College of Surgeons—The fourth international assembly of the International College of Surgeons will be held at the Waldorf-Astoria Hotel in New York June 14-16 in conjunction with the eighth national assembly. War surgery and rehabilitation will be the theme of the program which will include among other speakers the following

Col Raymond W Bliss M C U S Army The Transportation and Care of the Sick and Wounded from the War Zones
Mr Rodney Maingot FRCS London Management of Wounds of the Abdomen
Mr Hamilton Bailey FRCS London Crush Syndrome
Dr V V Lebedenko The Organization of Surgical Aid in the Soviet Army
Dr Fred H Albee New York Reconstruction of Bones and Joints
Robert T Merrill attorney Havre Mont A Layman's View of Rehabilitation
Dr Martial Bourard Port au Prince Haiti Autopsyotherapy in General and War Surgery

Dr Herman de Las Casas dean of the Faculty of Medicine of the University of Caracas Venezuela will deliver the annual Manuel Corachan Memorial Oration in Surgery

Cancer Fellowships Awarded—At a meeting of the board of directors of the Finney-Howell Research Foundation, Inc., Baltimore the following annual fellowships were awarded. Dr Rose I Shukoff University of Petrograd to work at the Glasgow Royal Cancer Hospital Glasgow Scotland under Dr P R Peacock for the third year. Emilia Vicari A M Ohio State University Columbus, to work at the Roscoe B Jackson Memorial Laboratory, Bar Harbor Maine under Clarence C Little Sc D for the third year. Borroughs Reid Hill Ph D Tulane University New Orleans to work with Louis F Fieser Ph D at Harvard University Cambridge Mass. for the second year. Dr Helicia Maier Paris France to work at Yale University School of Medicine New Haven Conn with Dr William T Salter a new fellowship and James Alexander Miller M S University of Wisconsin to work at the medical school University of Wisconsin also a new award. Fellowships carrying an annual stipend of \$2000 are awarded for a period of one year and applications must be made on blanks furnished by Dr William A Fisher secretary of the foundation 1211 Cathedral Street Baltimore before January 1 of each year. Fellowships are awarded only for research into the cause or causes and the treatment of cancer.

Koch Trial Ends in Jury Disagreement—In March 1942 the Federal Grand Jury sitting at Detroit indicted the Koch Laboratories Inc. together with two of the officers Dr William Frederick Koch and his brother Louis Koch finding them responsible for the shipment in interstate commerce

of packages of allegedly misbranded drugs variously labeled as Glyoxylic, Malonide and Benzoquinone. The indictment contained twelve counts covering twelve shipments of the products. Under the penalties of the Federal Food Drug and Cosmetic Act this offense would bear on conviction a total maximum penalty not to exceed twelve years' imprisonment together with a \$12,000 fine. The trial began on January 12 and the prosecution produced 49 witnesses who testified as experts and/or fact witnesses. The government rested its direct case on February 4 after presenting testimony that the products distributed by the defendants were misbranded in that they are not efficacious in the cure mitigation treatment or prevention of cancer allergies infections and their sequelae as claimed on the labels. Between February 5 and April 20 the defendants presented 104 witnesses including Dr William F Koch together with 24 licensed practitioners of medicine osteopathy, dentistry and veterinary medicine. Ten of these witnesses did not appear in court but gave depositions from various parts of the United States from Brazil and from England. The doctors who took the witness stand in behalf of the defendants testified to having cured or at least having more or less successfully treated several hundred patients with the 'Koch Synthetic Antibiotics'. The depositions recounted treatment of an additional 200 cases. 34 selected laymen testified before the jury that they had been cured by Dr Koch or by doctors using his drugs. The remedies were represented as being efficacious in the treatment of sixty-nine distinct diseases ranging from acute appendicitis to herpes zoster and special emphasis was placed on cancer tuberculosis coronary thrombosis and allergies. This was the longest trial in the history of the Food and Drugs Act the court transcript running well over 9000 pages exclusive of the depositions which aggregated several thousand pages themselves. On May 19 (nineteenth week) the judge gave his charges to the jury which failed to reach an agreement after over eight days of deliberation and was dismissed on May 28. Following dismissal the jury was polled and it was learned that nine had voted for conviction and three for acquittal. It was reported that the three who had held out for acquittal had done so from the first ballot. No date has been set for the retrial of the case, but it is assumed that it may be reached sometime late in the fall.

LATIN AMERICA

Dr Baehr in Mexico—Dr George Baehr chief medical officer, Office of Civilian Defense Washington D C is in Mexico City to confer with Mexican civilian defense officials on their organizational problems. On June 3 Dr Baehr spoke in the National Theater on 'The Organization and Operation of the Emergency Medical Service' and showed a slide film entitled 'Operation of Emergency Medical Service'. The sound track of the film is in Spanish. The following day Dr Baehr discussed 'Rescue Service' and showed the motion picture on 'Work of the Rescue Service'.

First National Congress of Public Welfare—The department of Public Welfare of Mexico through its secretary Dr Gustavo Baz announces the first National Congress of Public Welfare to be held in Mexico City August 15-22. A presidential order calling the congress was issued in view of the growing importance of the problems of social welfare throughout the world intensified and multiplied by the present war the pressing need of unifying the criteria the administration and the public welfare methods throughout the country the urgency of stimulating private cooperation toward the solution of the great national welfare problems and the advantages that result from the interchange of ideas between institutions and specialists interested in public welfare.

Public Health Program in El Salvador—The republic of El Salvador has recently made additional appropriations to project a public health program which was launched last year supplementing by several methods in trial funds amounting to half a million dollars received from the United States. San Salvador has authorized expenditures of \$80,000 for improvements to the water and sanitation systems and the construction of a new market a slaughterhouse and a public laundry. San Miguel is building a \$50,000 sewerage system and Santa Tecla has authorized expenditures of \$37,500 for a similar system. Other cities which have made appropriations for health and sanitation improvements in line with the program are Atiquizaya Zacateculuca and Tomacatiqui. Similar action is being considered by Chalchuapa and Ahuachapán. The sums set aside by these towns for health work will be supplemented by funds from the Servicio Cooperativo Inter-Americano Salud Publica. This agency is carrying on the inter-American health and sanitation work in Salvador under the direction of the Sanidad Publica.

April 21, 1943

The Projected National Medical Service

Speaking at the opening of a maternity and child welfare center, Mr. Ernest Brown, minister of health, said that under the Beveridge scheme every one would be able to call to his aid the best medical services that modern science could provide. The government looked confidently to the local health authorities with their long experience and residence in meeting the problems both of war and of peace, to undertake the new responsibility. The new task might involve adjustments of local government as the units must be large enough to allow scope for efficient planning. Another great principle was personal and professional freedom. Some were afraid of an organized national health service because they thought it would be a bureaucratic machine by which patients would be dragooned into health and doctors dragooned into mediocrity and servility. He would be the first to condemn such a service and would shrink from the task of preparing for it. But he did not believe this. Health was an intensely personal matter and any national service must be an intensely personal service. The family doctor, chosen by the family as the one in whom they had confidence and whom they often held in affection, must be the foundation stone.

Among doctors there was a real and intelligible fear that an organized national health service would bring strict control of the day to day professional work, the rule of forms and routine, the end of initiative and professional independence. He fully appreciated the danger, but it was one which could be avoided, and was not a defect inherent in every kind of national service. The medical service could be so organized as to center on the average practitioner a freedom to exercise his professional talents in a measure enjoyed at present only by a fortunate minority. One other guiding principle must be the promotion of health. It was not enough to organize the treatment of sickness when it had arisen. The causes of ill health must be tracked down and removed, and individual fitness must be promoted and maintained. The national service must be designed to prevent rather than cure. The field the government had to survey was the whole of what Mr. Churchill called "the spacious domain of public health." Discussions with representatives of local government, the medical profession and the voluntary hospitals had already started. Later the government would put before the country a general statement of the plans to be submitted to Parliament.

Parachuted Medical Units to Attend Wounded in Forward Areas

The success of parachuted medical units to attend to the wounded in the fighting in Tunisia is an advance in army medical service which promises to be revolutionary. During the operations a medical unit consisting of ten men, including a surgeon lieutenant, was dropped by parachute in a forward area close to the scene of fighting and attended in one day to 162 wounded or injured men. Of these only 1 died and but for the medical aid brought immediately to the spot the death roll must have been heavier. Several of the wounded had to have amputation on the spot and many others required the services of the operating table. The success of bringing the surgeon to the wounded instead of these to the surgeon must lead to the adoption in the British army of air borne medical units on a large scale. At present only the air borne divisions can

land surgeons and ambulance units by parachute and glider. This particular parachuted unit in Tunisia took down with it in containers full dressing station equipment, operating apparatus and instruments, anesthetics, sterilizers, medicines and dressings. Normally an air borne medical unit is ready to operate on a seriously injured man within ten minutes of landing and is so self contained both for medical supplies and for food that it can carry on for several days without having additional supplies dropped for it. The abiding principle of the air borne divisions is that a man must always be physically fit, ready and alert. A high standard of personal smartness and cleanliness is demanded.

Complete Pasteurization of Milk Urged on the Government

The minister of food received a deputation representing the British Medical Association, the National Association for the Prevention of Tuberculosis, the Joint Tuberculosis Council, the British Pediatric Association, the People's League of Health and other bodies to urge the complete pasteurization of milk. The acting chairman of the council of the British Medical Association said that there was no serious difference in the medical profession on the question of pasteurization. Prof. L. P. Garrod said that tuberculosis was deplorably common among dairy cattle, the percentage of milk samples containing tubercle bacilli was between 5 and 10. One third of the deaths from tuberculosis in children under 5 were due to the bovine organism. This meant two thousand deaths annually, and there was a much larger percentage of invalidism and crippling. Another disease of the cow transmitted to man was contagious abortion. Ordinary infectious diseases might also be transmitted, usually from contamination of the milk by the milker. All bacteria concerned in these diseases could be destroyed by moderate heat for a short time. Pasteurization did not alter flavor. Admittedly it destroyed some vitamin C, but this could be made up for by fruit juice.

Dr. Alan Moncrieff said that pediatricians were anxious about the possibilities of infections of the alimentary tract traceable to dangerous milk. Only pasteurization gave the guaranty of safety. There was no scientific evidence that raw milk conferred any sort of immunity. Even if it did, the price to pay would be too high.

Dr. C. O. Hawthorne, representing the People's League of Health, said that the public was attracted and misled by such terms as "clean" or "pure" milk, and even "accredited milk," which had received some official countenance, did not escape reproach. He preferred the term "safe milk," meaning pasteurized, the only guaranty against infection.

Replying to the deputation, than which he could not imagine a more influential one, the minister of food recognized the obligation of the government to obtain a milk supply which can do no harm, or, if this was not possible, to issue instructions as to how people should obtain reasonable security in the drinking of milk. He was at present engaged in collecting all the necessary information regarding the available machinery and competent labor to undertake the work which would give the security desired.

Proposed Accident Service of the Future

At a meeting of the British Orthopedic Association Mr. Reginald Watson-Jones presented a report which was approved by the association, for a comprehensive accident service which should embrace the treatment of soft tissue injuries, infections of the hand, burns, tendon injuries, nerve injuries and indeed all injuries of the locomotor system. As these injuries are just as incapacitating as fractures, their importance to industry is just as great and they outnumber fractures greatly. It was held

that the problem would be solved better by reorganizing the accident departments of general hospitals than by forming special accident hospitals. The accident department must be reorganized, replanned and often rebuilt. There must be a separate organization and even a separate entrance for accident cases. The director of the accident service should be trained in every branch of surgery, experienced in orthopedic surgery and specially trained in the problems of trauma.

As the accident unit must provide a twenty-four hour service the director must be aided by two first assistants in addition to the usual resident surgical officers, house surgeons and house physicians. There must be full secretarial and clerical assistance and social service personnel. Close liaison must be established with industrial medical officers in the area served by the unit. The rehabilitation of sedentary and light industrial workers could usually be completed within the hospital itself by physical therapy, occupational therapy and recreational therapy. For the more seriously injured who must return to heavy industry there must be a special rehabilitation annex with playing fields, swimming pools and gymnasiums. In such special centers the treatment would be continued by the same team, and they must remain under the same administration and surgical control as the parent hospital.

Women to Be Paid the Same Compensation as Men for War Injuries

The demand that women should have the same rights as men has again been successful. In the House of Commons protest was made against women being paid lower compensation for war injuries than men. The government appointed a committee to investigate the subject. The reason for the difference is that compensation is related to earnings, which generally are lower for women than for men. The government has recognized that, as the Personal Injuries (Civilians) Scheme applies only to injuries associated with the war, there is an essential difference between it and any permanent scheme of compensation. It therefore has decided that the rates payable for disablement to gainfully occupied persons need not be related to earnings or to any other factor involving sex discrimination. Nongainfully occupied persons, including housewives, shall have their rates of injury allowance and disablement pension increased to those now paid to gainfully occupied men. The effect of the change is to raise the weekly compensation of gainfully occupied women from \$7 to \$9, which is that paid to men. This is paid while the injured person is unable to work, but if disablement continues after six months the compensation is replaced by a disablement pension graded according to the degree of disablement. The pension scale for this war is from \$2 for 20 per cent disablement to \$9.50 for total disablement. This is what the soldier receives. Hitherto among civilians only the civil defense man and the male earner had the benefit of this scale. The most that a woman could receive ranged from \$1.50 for 20 per cent disablement to \$7 for total disablement. Now all women will have the advantage of the men's scale.

Big Fall in German Birth Rate

The special correspondent of the *Times* reports from the German frontier that deep concern is felt in Germany at the latest official figures for births published in the *Wirtschaft und Statistik*. In 1942 the number of live births was about 1,240,000 or 290,000 fewer than in 1941. When Hitler came into power in 1933 the birth rate was 147 per thousand. Consequent on the moral pressure exerted by the Nazi government reinforced by social legislation the rate reached 184 in 1936 and 204 in 1939 and 1940 but fell to 188 in 1941 and to 152 in 1942. Thus almost the whole of the increase achieved by the pressure of the Hitler government has been lost.

AUSTRALIA

(From Our Regular Correspondent)

March 27, 1943

The Development of Drug Manufacture in Australia

The development of drug manufacture in this country constitutes a remarkable wartime achievement. On the entry of Japan into the war, the local manufacture of drugs became a matter of supreme importance. Two distinct problems had to be overcome before local production could commence on a sufficiently large scale—processes and methods of production had to be worked out in the laboratory and in the field by highly skilled scientific workers and the results of scientific work had to be applied to commercial production. To achieve this purpose the Medical Equipment Control Committee received the full cooperation of wholesale and manufacturing firms and of university and other scientific workers and such scientific bodies as the Council for Scientific and Industrial Research and the Australian Association of Scientific Workers. The results of their investigations have added a brilliant chapter to the story of Australian scientific research.

Drugs now being manufactured locally and from local materials in sufficient quantities for Australian needs include magnesium oxide, heavy magnesium oxide, magnesium trisilicate, sodium bicarbonate, chlorinated lime, phenol, proflavine, silver proteinate, zinc sulfate, alum, digitalis, caffeine, theobromine, sulfanilamide, sultaguanidine, atropine, barium sulfate, ascorbic acid, nicotinic acid, scopolamine, chloral hydrate and chlorobutanol. Drugs which will soon be available include acetophenetidin, colocynth, phenolphthalein, kaolin, nikethamide, belladonna, ergot, gentian violet, salicylic acid, hexoestrol, dextrose, paraldehyde and phenobarbital.

The production of morphine direct from poppy hay is a triumph for Australian research workers. Under the new method the tedious process of obtaining opium from incised poppy capsules has been eliminated. As a result of the wartime shortage of cod liver oil a search for substitutes was made and vitamin rich oils are now being extracted from certain Australian sharks. Experiments have shown that oleum persicorum (peach kernel oil) forms a satisfactory substitute for olive oil.

Included in the work at present being undertaken by the Australian Association of Scientific Workers are local production of general, local, intravenous and rectal anesthetics, mercurial diuretics, antimonial drugs, organic arsenicals for intravenous and oral use and a number of other chemicals used in pharmacy.

Manufacture of Surgical Instruments

At the outbreak of war there were only six skilled surgical instrument makers in Australia, and these were concerned mainly with the manufacture of highly specialized instruments and equipment. At that time the value of instruments produced in twelve months is estimated to have been less than £5,000. Today production has risen to an annual value of £300,000, and Australia is able to provide herself with practically all the essential equipment for use by surgeons. One of the most interesting achievements is the local manufacture of hypodermic syringes. An Australian firm is now producing more than a thousand syringes a week and is in a position to meet all demands likely to be encountered. The syringes are made from a special Australian heat-resistant glass and Australian alloy metals. The finished product compares favorably with syringes previously imported from overseas. Parallel development is taking place in the field of laboratory apparatus and reagents. Australia in the near future should be independent of overseas supplies of most items of scientific glassware. Crucibles and other porcelain laboratory requisites are also being produced locally and such items as precision grade analytical weights and analytical balances are now in the course of production.

Deaths

Albert Hammond Hoge ★ Bluefield, W. Va., University College of Medicine, Richmond, 1908, in 1932 served as president of the West Virginia State Medical Association, elected president of the West Virginia Public Health Council in 1941, past president of the Mercer County Medical Society, served as a captain in the medical corps of the U. S. Army during World War I, fellow of the American College of Physicians, specialist certified by the American Board of Internal Medicine, a member of the staff and part owner of St. Luke's Hospital, served as president of the Rotary Club, aged 57, died April 8, of heart disease.

Herbert Bancroft Priest, Aver, Mass., Harvard Medical School, Boston, 1901, member of the Massachusetts Medical Society, served during World War I, lieutenant colonel in the medical reserve corps of the U. S. Army not on active duty, served as chairman of the school committee, trustee of the library and member of the board of health on the staff of the Community Memorial Hospital, formerly a contract surgeon for the Civilian Conservation Corps at Fort Devens, recently a recruit examiner, aged 68, died March 12, of coronary thrombosis.

Vivian Lionel Benson, Warwick, N. C., R. I., Baltimore University School of Medicine, 1897, aged 69, died March 19, of hypertensive heart disease.

John William Blackett, Fort Covington, N. Y., McGill University Faculty of Medicine, Montreal, Que., Canada, 1898, member of the Medical Society of the State of New York, member of the attending staff of the Alice Hyde Memorial Hospital, Malden, served as coroner of Franklin County, since 1918, health officer of the town of Westville, school physician, aged 69, died March 22, of cerebral thrombosis and arteriosclerosis.

Alexander Dunlap Blume, Dix Ridge, Ky., Kentucky School of Medicine, Louisville, 1890, member of the Kentucky State Medical Association, aged 76, died March 26, of nephritis.

Elmer Francis Blank ★ Bridgeport, Conn., Stirling Medical College, Columbus, 1897, served as president of the city board of health on the staff of St. Vincent's Hospital, aged 72, died March 21, of peritonitis meningitis.

Wyatt Clinton Boylston, Charlotte, N. C., Medical College of the State of South Carolina, Charleston, 1913, aged 53, died March 30, in the Mercy Hospital of coronary occlusion.

Herman A. Brennecke ★ Aurora, Ill., Rush Medical College, Chicago, 1896, past president of the Kane County Medical Society, a member of the Chicago Pathological Society, for many years a member of the board of education, founder and head of the Brennecke Clinic, surgeon for the Chicago Burlington and Quincy, the Chicago and Northwestern, the Chicago Milwaukee and St. Paul, the Elgin Joliet and Eastern and the Chicago Aurora and Elgin railroads, aged 71, died, March 20, of carcinoma.

George Stewart Brown ★ New Orleans, Medical Department of Tulane University of Louisiana, New Orleans, 1904, also a pharmacist, formerly associate professor of pharmacy at his alma mater, treasurer of the Louisiana State Pharmaceutical Association from 1897 to 1921, aged 76, died, March 20, in the Southern Baptist Hospital of arthritis of the spinal column.

Arthur Conklin Brush ★ New York, College of Physicians and Surgeons, New York, 1884, an Affiliate Fellow of the American Medical Association, fellow of the American College of Physicians, consultant to the Kings County, Coney Island and Brooklyn Eye and Ear hospitals and the House of St. Giles the Cripple, Brooklyn, aged 80, died, March 17, in the Methodist Hospital, Brooklyn, of bronchopneumonia.

Charles Evans Buchanan, Claremont, N. H., University of Vermont College of Medicine, Burlington, 1906, member of the New Hampshire Medical Society, past president and vice president of the Sullivan County Medical Society, school physician, on the staff of the Claremont General Hospital, aged 61, died, March 23, in Reading, Vt., of cerebral thrombosis due to arteriosclerosis.

William Thomas Burleigh, Pittsburgh, Bellevue Hospital Medical College, New York, 1884, member of the Medical Society of the State of Pennsylvania, served in the medical corps of the U. S. Army during World War I, councilor of the Academy of Science and Art, aged 80, formerly on the staff of the South Side Hospital, where he died, March 23, of arteriosclerosis.

William Meade Burwell ★ Chincoteague, Va., Medical College of Virginia, Richmond, 1895, acting assistant surgeon, U. S. Public Health Service, past president of the Accomac County Medical Society, bank president, member of the county school board, aged 76, died, April 2, in the U. S. Marine Hospital, Baltimore, of arteriosclerotic heart disease and bronchopneumonia.

Charles Bernard Busta, Cedar Rapids, Iowa, State University of Iowa College of Medicine, Iowa City, 1905, on the staff of the Mercy Hospital, aged 60, died, March 14, of nephritis.

Eugene Campbell, Los Angeles, New York Homeopathic Medical College, New York, 1878, aged 86, died, March 13, in Inglewood of coronary thrombosis.

Saverio Cerullo, Waterbury, Conn., Tufts College Medical School, Boston, 1936, diplomate of the National Board of Medical Examiners, served on the staffs of the Waterbury and St. Mary's hospitals and Chase Clinic, aged 33, died, March 26, in the Trueman (N. Y.) Sanitarium of pulmonary tuberculosis.

Joseph Kelsey Chipp, Rose Hill, Kan., Central Medical College of St. Joseph, Mo., 1899, aged 67, died, March 21, of coronary occlusion.

George Clay Coates, Butler, N. J., University of the City of New York Medical Department, New York, 1888, for two years mayor of Butler and for six years served on the borough council, served as a captain in the medical corps of the U. S. Army during World War I, aged 77, died, March 26, of pneumonia.

Joseph Bernard Corley, Webster Groves, Mo., Missouri Medical College, St. Louis, 1888, aged 79, died, March 18, of heart disease.

Warren Fales Draper Jr. ★ Arlington, Va., George Washington University School of Medicine, Washington, D. C., 1939, assistant surgeon in the U. S. Public Health Service, served his internship at the U. S. Marine Hospital, San Francisco, for merly stationed at the U. S. Marine Hospital, Boston, and the U. S. Quarantine Station at Miami, Fla., organized the health unit in the Lamar County (Texas) military area, aged 30, died May 17, in Walter Reed General Hospital, Washington, D. C., of brain tumor.

James A. Duff, Dundee, Ky., Hospital College of Medicine, Louisville, 1904, member of the Kentucky House of Representatives, formerly a member of the county board of education, aged 67, died, March 20, of leukemia.

Philip Roche Dwyer ★ Salem, Mass., Harvard Medical School, Boston, 1920, visiting surgeon on the staffs of the Boston City Hospital, Salem Hospital, Josiah B. Thomas Hospital, Peabody, and the Danvers (Mass.) State Hospital, aged 49, died, February 28, of a ruptured diverticulum.

John Christopher Dyer, Penns Grove, N. J., George Washington University School of Medicine, Washington, D. C., 1912, aged 67, died, March 25, of coronary thrombosis and arteriosclerosis.

William H. Finn, Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1897, aged 73, served on the staff of St. Anne's Hospital, where he died, April 22, of heart disease.

Stanley Edward Graham ★ St. Francisville, La., Memphis (Tenn.) Hospital Medical College, 1910, for many years mayor of Melville and coroner of St. Landry Parish, aged 54, died, March 25, of angina pectoris.

Charles J. Gremer, Long Branch, N. J., Baltimore Medical College, 1909, for fourteen years served as city physician, a member of the staff of the Dr. E. C. Hazard Hospital, aged 57, died, March 23, of cirrhosis of the liver.

William Cory Hand ★ Hartley, Iowa, Northwestern University Medical School, Chicago, 1906, veteran of the Spanish American War and World War I, city health officer, owner and medical director of a hospital bearing his name, aged 63, died, March 22, of coronary thrombosis.

Charles A. Heaton, McCutcheonville, Ohio, College of Physicians and Surgeons, Keokuk, Iowa, 1880, aged 87, died, March 22, in Tiffin of carcinoma of the kidney.

Charles Russell Henderson, Reading, Mass., Boston University School of Medicine, 1889, member of the Massachusetts Medical Society, for many years school physician, member of the board of health of Reading, on the staffs of the Melrose (Mass.) and Winchester (Mass.) hospitals, aged 73, died, March 31, of coronary occlusion.

Hiram H. Hensley, Richmond, Ky., Louisville Medical College, 1906, aged 63, died, March 27, in Hollywood, Fla., of carcinoma of the lung.

John A Holland, Upper Montclair N J, New York University Medical College, New York 1898 served in the medical corps of the U S Army during World War I, aged 75, died, March 22, of heart disease

Oscar House, De Soto Ill St Louis College of Physicians and Surgeons, 1907, member of the Illinois State Medical Society served at one time as mayor of De Soto served during World War I aged 66, was killed, March 17, when his car was struck by a train

John Valentine Hughes, Los Angeles Cooper Medical College San Francisco 1896 formerly served on the staff of the Linc Hospital San Francisco, and as superintendent of the San Francisco Hospital, aged 70, died February 26, in the Queen of Angels Hospital of bronchopneumonia

Carl Haller III Newark, N J Columbia University College of Physicians and Surgeons, New York, 1918, fellow of the American College of Surgeons, attending obstetrician to the Essex County Hospital for Contagious Diseases Belleville and Hospital of St Barnabas and for Women and Children, member of the board of trustees of the Newark Museum secretary of the Maternal Welfare Board of New Jersey aged 50 died March 28, in Mantoloking of coronary thrombosis

Edward Ambrose Keyes Brooklyn Long Island College Hospital Brooklyn, 1911, on the staff of St Mary's Hospital aged 57 died, March 16 of carcinoma of the colon

Edward Francis King, Anderson Ind, University of Louisville (Ky) Medical Department, 1911 formerly on the staff of the Logansport (Ind) State Hospital and St John's Hickey Memorial Hospital, aged 55, died March 31, of hypertension

Benjamin G Long, Buffalo University of Buffalo School of Medicine 1883 member of the Medical Society of the State of New York, formerly clinical instructor in obstetrics at his alma mater, aged 84 died, March 8 of cerebral thrombosis

Milton McNeilan, Safety Harbor Fla, Kentucky School of Medicine Louisville 1889 formerly on the staff of St Joseph's Hospital Parkersburg W Va aged 78 died, March 18 in West Union Ohio, of cerebral hemorrhage

John William Melick, Columbus Ohio Ohio Medical University, Columbus 1896 aged 72, died March 1, in the Grant Hospital of carcinoma of the prostate

John Lee Meyers, Shepherdstown W Va Baltimore Medical College 1903 president of the Peoples Bank Charles Town and a director of the Jefferson Security Bank served on the staff of the City Hospital Martinsburg aged 68 died March 22, in the Charles Town (W Va) General Hospital of acute dilatation of the heart chronic nephritis and hypertension

John Baker Miller Long Beach Ind Marion-Sims College of Medicine St Louis 1893 Barnes Medical College St Louis 1896 member of the Illinois State Medical Society served as assistant physician to St Louis Female and City hospitals St Louis aged 86, died April 3 at his winter home in Lake Worth Fla

Carl E Moehle, Brooklyn Jenner Medical College Chicago 1902 aged 81 died March 24, in Hempstead N Y of pneumonia and arteriosclerosis

Francis Alden Moore, Yankton S D Minneapolis College of Physicians and Surgeons medical department of Hamline University 1898 mayor of Yankton served on the staff of the Sacred Heart Hospital aged 71 died March 24 of coronary thrombosis

Albert Johnson Newman Hammond La Memphis (Tenn) Hospital Medical College 1905 past president of the Tangipahoa Parish Medical Society health officer of Hammond aged 63, died March 27 in New Orleans of spinal meningitis

Thomas Jesse Oliver, Green Bay Wis Wisconsin college of Physicians and Surgeons Milwaukee 1898 past president of the Brown Kewaunee Counties Medical Society formerly city physician and health officer of Green Bay member of the staff of St Mary's Hospital aged 68 died March 13 of thrombosis

Sylvanus Purdy, White Plains N Y Bellevue Hospital Medical College New York 1897 member of the Medical Society of the State of New York and the American Urological Association served overseas during World War I lieutenant colonel and executive officer of the 50th Infantry Regiment of the New York Guard member of the staffs of the White Plains and St Agnes hospitals White Plains and the Grasslands Hospital Valhalla aged 69 died March 2 of heart disease

George Brackett Rice, Brookline Mass Boston University School of Medicine, 1886, member of the Massachusetts Medical Society, fellow of the American College of Surgeons, specialist certified by the American Board of Otolaryngology professor emeritus of laryngology and rhinology at his alma mater consulting surgeon, nose and throat department, Massachusetts Memorial Hospitals, formerly a member of the medical board of the Westboro (Mass) State Hospital, aged 83, died, March 28, of heart disease and parkinsonism

Robert Lee Richardson, Franklin Tenn, University of Tennessee Medical Department, Nashville, 1893, aged 75, died, March 20, of bronchopneumonia

Simon Richmond, Boston Harvard Medical School, Boston 1897 member of the Massachusetts Medical Society, aged 70 died February 5

Ruby Theodore Scott, Fort Lee N J Vanderbilt University School of Medicine Nashville, Tenn, 1917 formerly health officer of Fort Lee, aged 57, was found dead March 17, of coronary sclerosis and occlusion

Clarence A Smith Monte Vista Colo St Louis University School of Medicine, 1905 aged 58 died February 20

Flem D Smith Blytheville Ark Memphis (Tenn) Hospital Medical College 1911 for many years secretary of the Mississippi County Medical Society served as councilor of the First District of the Arkansas Medical Society formerly city and county health officer at one time local surgeon for the Frisco Railroad aged 62 died March 27, of cerebral hemorrhage

John Holmes Smith Jr, New Orleans University of Maryland School of Medicine, Baltimore 1905 member of the Louisiana State Medical Society formerly associated with the U S Public Health Service instructor in medicine at the Tulane University of Louisiana School of Medicine, medical examiner on the draft board conducted an outpatient clinic at the Charity Hospital on the staff of the Baptist Hospital where he died March 27 of glioma of the brain aged 60

William Ballance Smith, Atlanta Ga Tulane University of Louisiana School of Medicine New Orleans 1936 surgical consultant the Aetna Casualty and Surety Company aged 37 died March 22 in Beaumont, Texas of coronary thrombosis

William Lewis Steen, New Castle Pa Western Pennsylvania Medical College Pittsburgh 1905, member of the Medical Society of the State of Pennsylvania for many years health officer of New Castle served during World War I aged 68 died March 18 in the Veterans Administration Facility Aspinwall of nephritis

Alexander Michael Steinfeld Columbus Ohio Starling Medical College Columbus 1897 member of the Clinical Orthopaedic Society and the American Academy of Orthopaedic Surgeons fellow of the American College of Surgeons served as a captain in the medical corps of the U S Army during World War I formerly assistant professor of surgery at the Ohio State University College of Medicine aged 70 on the staff of the Grant Hospital where he died, March 25 of coronary thrombosis

William Austin Tansey, South Orange N J University and Bellevue Hospital Medical College New York 1912 member of the Medical Society of New Jersey member of draft board number 34 on the courtesy staff of the Orange Memorial Hospital where he died April 4 of arteriosclerosis and coronary occlusion aged 61

Edwin Pratt Woolard, Philadelphia Hahnemann Medical College and Hospital of Philadelphia 1920 aged 48 died March 7 in the Hahnemann Hospital

MERCHANT MARINE CASUALTIES

Joseph Grabenstein Woodside N Y Baltimore University School of Medicine 1898 member of the National Gastroenterological Association formerly on the staff of the New York Polytechnic Medical School and Hospital New York ship surgeon in the U S Merchant Marine aged 65 was killed February 7 in the North Atlantic Ocean when his boat was torpedoed by a submarine

Charles Immanuel Loeble Brooklyn Albany (N Y) Medical College 1912 ship surgeon in the U S Merchant Marine aged 55 died in enemy action February 3 when the ship on which he was serving was torpedoed off Iceland.

MISBRANDED PRODUCTS

1. **Distrust Notice**—These Notices of Judgment are issued under the Food and Cosmetic Act and in cases in which they refer to drugs and devices they are designated D D N J and foods F N J. The distracts that follow are given in the briefest possible form: (1) the name of the product (2) the name of the manufacturer, shipper or con-sumer (3) the date of shipment (4) the composition (5) the type of misbrand (6) the reason for the charge of misbranding and (7) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

Eliazo Mineralled Water - Fleetsville Company Redwood City Calif
 Sold Dec 1910. Composition essentially lime water containing
 small quantities of iron and traces of sulfates and chlorides.
 Mineralled because of its reputation as a biologically pure mineral
 water which would be effective for run down nervous conditions, arthritis,
 painful joints, gall bladder disorders, headaches, nervousness, stomach
 ulcers, kidney ailments, toxic diversions, rheumatism, eczema, varicose veins
 and various other ailments. Further misbranded because although the
 claim is to its having been treated by electrolysis, might give the impres-
 sion that this added to its therapeutic value, such was not the case—
 [D. D. & J. F. D. C. 114 September 1912]

La Bonita Hollywood Skin Stimulant and La Bonita Hollywood Texture Oil—House of Hollywood Los Angeles Shipped May 2, 1941 Composition "Skin Stimulant—essentially alcohol, glycerin, perfume and coloring material 'Texture Oil'—essentially a perfumed vegetable oil. The first named was misbranded because the term 'Texture Oil,' together with the directions 'Pat into the neck and jaw line using a brisk slapping motion with the back of the hand. Non fattening,' were false and misleading, since they gave the impression that the preparation would affect the structure of the skin, whereas it would not. Both articles misbranded under provisions of the law applicable to cosmetics— [D D N J, F D C 509 September 1942]

Magnetic Ray Appliance—Magnetic Ray Company, Dallas, Texas
Shipped May 1, 1940 Composition a coil made in the form of a belt to which was fastened a wire to be connected with an ordinary lighting current so as to produce a magnetic field Misbranded because falsely represented to be an effective treatment for asthma, arthritis, anemia, Bright's disease, diabetes, deafness, eczema, epilepsy, goiter, heart diseases, obesity, paralysis and many other conditions, besides stimulating various glands and organs, increasing physical and mental efficiency, clearing the complexion, causing absorption of growths and deposits such as tumors, goiters and blood clots and favorably affecting circulation, elimination, digestion, nutrition and metabolism—[D D N J, F D C 518, September 1942]

Merlek Mineral Water—Lee Brothers Orkland, Calif Shipped May 18 1910 Composition approximately nothing but sea water Misbranded because labels represented to remedy mineral deficiencies and to help in nutrition from collapse excess acid, rundown conditions and many other ailments besides being valuable in maintaining health and securing proper growth, good teeth and blood for life—[D D N J 1 D C 221 September 1912]

Dolph Candy—**Lu Pak Ej Inc., Chicago** Shipped Oct. 21, 1941
Composition essentially sugar, protein, fat, soybean flour and small
amounts of table salt phosphates and calcium compounds Misbranded
because falsely represented as effective for safe reduction of weight, in
conjunction with the dietary program given in the labeling, for providing
a proper method of "slenderizing," or losing excessive weight Further
misbranded under the provisions of the law applicable to foods as reported
under F V J 2537—[D D N J F D C 211 September 1942]

Regol — Cleveland Von Company, Cleveland Shipped Nov 26 1940
Composition — a mixture of bile and plant drug extracts dissolved in
alcohol (26 per cent) and water. Misbranded because of false and mis-
leading representations that it would be a rational and effective remedy
for diseases of the liver, digestive disorders, fermentation and gas in the
intestines, sick headache, chronic constipation, colitis and many other
internal disorders, as well as for sallow, blotched and itchy skin —
{ D D N J F D C 302 September 1942 }

Thermo Roller—Thermo Roller Corporation, New York Shipped Feb 24 1940 Composition a device in the form of a rolling pin, covered with corrugated rubber and electrically heated. Falsely represented to curable one to achieve a completely balanced figure without special effort by concentrating on the spot or area most out of proportion to be efficacious in reducing abdomen, hips thighs and 'dowager's hump' between the shoulders, remove local fat deposits eliminate fat cell elements and be effective in treating scurvy, rheumatism, arthritis lumbago and other common nervous disorders—[D D N J, F D C 516 September 1942]

Tonico Fir-Veta—El Modelo Medicine Company San Antonio, Texas Shipped Nov 25, 1940 Composition essentially strychnine and quinine salts, with alcohol syrup and small amounts of iron, calcium manganese and potassium compounds, including hypophosphites. *Misbranded* because of false and misleading representations that it would efficaciously promote return and insure health and Nature in her work in keeping one well and restore health, thus bringing lasting happiness rebuild children increase their resistance, enable them to gain weight relieve them of overtension and cause them to sleep more restfully tone up the system, stimulate or restore the appetite, enable one to gain additional energy, prevent tired nervous, disordered stomach, sluggish bowels and loss of appetite increase the vitality of working girls, and help in keeping the nerves fit Further misbranded because of the label claim, 'El Modelo Medicine Co has complied with the new Federal Food Drug and Cosmetic Act'—(D D N J F D C 504 September 1942)

Torso Herb Vitamin—John Walters, Baltimore Shipped Oct 11 1939
Composition essentially a fatty oil, an organic sulfur compound turpen-
tine oil, cade oil methyl salicylate, alcohol and water with extracts of
plant drugs including aloe and ginger Misbranded because falsely
represented on label as useful in treating nephritis, diabetes, dropsy, high
blood pressure and kidney, stomach and bladder disorders—[D D N J,
F D C 505 September 1942]

Correspondence

ABSENTEEISM

To the Editor—There is at present a great deal of justified comment on the widespread problem of absenteeism in war industry. A number of clear studies have demonstrated that the question is not simple and demands an attack from many different sides, a very important one being the rejuvenation of the workers' sense of pride and responsibility.

There is, however, one phase of this inquiry, relatively small yet important, which is generally overlooked and which can be handled, in large measure, by the family physician. Briefly stated, the real contribution he can make is to take a just, firm stand on requests for certification.

These requests fall roughly into three types, which I will describe in the order of their importance.

Request for leave of absence because of illness. The generous family physician too often recommends long holidays for minor disorders. A recent example comes to mind. A young woman came to the hospital with a note from her doctor asking that she be granted four to six weeks leave of absence for laryngitis. Careful examination by a certified specialist revealed trivial congestion of the vocal cords. The patient was informed that such a leave could not be granted and she stormed out of the hospital in a fit of anger. Numerous similar instances could be cited in which holidays ranging from two to four weeks have been requested for slight, easily corrected disorders. It is not only unpleasant but for various reasons, also quite imprudent to contradict the family physician yet this often has to be done. In this emergency it is the function of every physician to see to it that healthy workers are kept on the job as regularly as is humanly possible.

Request for change of shift, the second source of trouble. Most people do not care to work at night. They will think of every conceivable medical excuse and ask the busy family doctor to certify it. In one 'the night air is unhealthy' in another 'it strains his eyes' in another 'it aggravates constipation', in still another it is causing bronchitis. When such requests are denied by the industrial physician, discontent and a feeling of unfair treatment are created. As a result, workers are determined to 'get even' at the first opportunity and take unwarranted time off. A few sympathetic moments with a firm unprejudiced family doctor could eliminate this source of friction.

Request for change of job the last common trouble maker. It is astounding to note how readily the family doctor certifies that certain fumes, gases, vapors or dusts (about which the patient is poorly informed) are 'dangerous' and 'poisonous' to the patient, who must immediately be removed to another safer job. It is hardly necessary to point out that every possible precaution is taken in modern plants to safeguard the worker against hazardous exposure. By simply inquiring by telephone what material is used what the hazard really is and what precautions are being taken the family doctor can avoid panic confusion and unnecessary layoff to clear the body of these alleged poisons.

These special problems are aired with no critical or malevolent intent. The family physician is extremely busy these days and can hardly be expected to be aware always of the difficulties of wartime industry. My plea is simply this. Let there be more cooperation between the local and the plant physician. With more consultations there will be fewer conflicts and more man hours saved.

ANDREW M. BABER, M.D., Brooklyn
Chief Medical Examiner, Sperry Gyroscope Company, Inc.

"CLAUDE BERNARD" BY IZQUIERDO

To the Editor—I am thankful for the notice of my book "Bernard, creador de la medicina cientifica," published in THE JOURNAL, January 2, page 90, a notice which, I am sorry to say, I did not know about till recently. May I ask you to excuse me for clarifying three assertions in the notice, which, although apparently inspired in the contents of the book, are not quite in accordance with them?

The three assertions are that (1) the first Spanish translation of Bernard's Introduction "appeared in Mexico in 1880," (2) the second translation by don Carlos Garcia, was a "more concise translation itself a classic," and (3) that such a translation was published in the somewhat obscure village of San Luis Potosi.

What I have to say in connection with these three assertions is that

1 On page xiii, line 6, of my book it is stated very plainly that the first Spanish translation was made in Spain in 1880.

2 What I asserted in connection with Garcia's translation, at the beginning of the second paragraph on page xi was that after revision of it I had discovered that it was vitiated by numerous and at times crude errors which I deemed due to Garcia's (who was a lawyer) lack of preparation in the biologic sciences. Thus I was far from declaring his version a classic.

3 As to San Luis Potosi, let me say that it is more than an obscure village: it is the capital of one of our states and for a number of years has been a center of culture in the central part of the country.

SMALLPOX VACCINATION REACTIONS

To the Editor—Every physician should be acquainted with the three types of reactions which follow smallpox vaccination. All reactions fall within one of the three groups, vaccinia, vaccinoid or immune reaction.

The vaccinia, or primary take is the reaction obtained when one who has no immunity is vaccinated with a potent cowpox virus. The site of vaccination should not be larger than $\frac{1}{8}$ inch. If the multiple puncture method is used practically nothing can be seen at the site of the vaccination for the first two to four days. After this period of incubation is passed changes are quite rapid. First one or several macules form followed promptly with papules. These papules may become confluent as the vesicle forms. By the ninth day a definite pustule usually surrounded by an areola is present. At the time of the pustule the patient may suffer from a little malaise and have some fever. Following the pustule a scab forms. If the original vaccination site was not more than $\frac{1}{8}$ inch and if no dressing was used on the vaccination a scar not more than $\frac{1}{8}$ inch remains.

The next type of reaction the vaccinoid (sometimes referred to as an accelerated take) is one which has much significance because it indicates a partial immunity to smallpox. This vaccinoid reaction occurs in one who either has previously had smallpox or has had a previous vaccinia or vaccinoid reaction. Over a period of years some people on revaccination about every five to seven years have a succession of vaccinoid reactions each one of which will leave a scar. These vaccinoid scars are usually smaller than the scar which followed the primary take.

The typical vaccinoid reaction goes through the stages that the primary vaccination does: i.e. the macule, papule, vesicle, pustule and scab. The reaction is more rapid reaching the

apex on about the sixth day. In addition to being more rapid the local reactions are much milder, and the patient very seldom experiences malaise and fever.

The third type is called the immune reaction (sometimes called the immediate reaction). This reaction is frequently overlooked but it is so definite it should not be. As Jenner himself recognized it, I propose that it be called the Jenner reaction. If we spoke frequently about having a Jenner test made to see if we had immunity to smallpox, our attention would be called to this reaction and it would not be so frequently overlooked. This immune reaction is found in all persons who have an active immunity from either a previous case of smallpox, a vaccinia or a vaccinoid reaction. The reaction comes on about twelve hours after vaccination and it lasts for forty-eight to seventy-two hours. It consists of a macule or a papule—never a pustule. There is slight induration around the vaccination site caused by the inflammatory reaction of the body destroying the cowpox virus. If one rolls the vaccination site under the finger one gets a feeling of possibly a small pebble in the skin. If this Jenner reaction is present the person is immune to smallpox and no more vaccination of that individual is necessary at that time.

Smallpox vaccination, as not reported, is positive or negative. Even these terms are inaccurate and usually meaningless. No greater mistake can be made in interpreting smallpox vaccinations than to say that vaccinia and possibly vaccinoid reactions are positive and other are negative. The word negative is usually considered to mean no reaction. If one does not get a reaction following a smallpox vaccination, something is wrong with the technique. I have never seen a person whose arm was properly prepared and on whom a potent virus was used that did not give a reaction of some kind.

If a reaction does not occur even after several attempts one should never infer that the person is immune because that may be far from the truth. Rather one should realize that the technique is at fault. I have seen at least 1 case of smallpox in a person who had been vaccinated five times and each vaccination reported negative. That person thought that he was immune to smallpox because he did not get a take. If his vaccination had been properly done and properly observed he would have realized that he did not have a Jenner reaction, that the technique was at fault and that he did not have immunity to smallpox.

The use of the Jenner reaction is of great help in determining the immunity of contacts to a given case of smallpox. If a contact has a Jenner reaction he can immediately be released from quarantine. He does not have to wait to see if his vaccination is going to take nor does he have to be kept in quarantine for another revaccination because the first attempt was unsuccessful.

There is one other type of reaction which one sometimes sees when doing vaccinations. It is mentioned so that it will not be confused with the Jenner reaction. That is the reaction of allergy—allergy either to trauma or to some substance in the cowpox virus. This allergy reaction comes on a few minutes after the vaccination and leaves quite promptly. It fades away before the Jenner reaction begins to appear.

Every doctor doing vaccinations should see those vaccinated on the second day. If at that time the person shows a Jenner reaction, further observation is not necessary. A beginning vaccinia and vaccinoid will not show at that time.

If a reaction is not present on the second day the patient is told to report on the fifth or sixth day. If a vaccinoid reaction

is present it will be at its height and the physician can so record the reaction and will not have to see the patient again.

If the vaccination is taking but has not reached its height on the fifth or sixth day, it is better to see the patient again on the ninth to eleventh day. Observe the vaccinia at its height. Check the patient to see that he is not using a celluloid shield or a bunion plaster on it. If the pustule is oozing and soiling the clothing, a piece of sterile gauze can be fastened to the clothing to protect the clothing. The process of vaccination is a septic one throughout. The skin must be kept in a normal healthy condition, so that secondary infection does not take place. Coverings which hold moisture cause a fungous growth around the vaccination. This in turn causes a maceration of the skin and produces a fertile field for secondary invaders. Large scars and extremely sore arms are usually caused by secondary infection and do not indicate any more immunity than a small scar with little reaction.

If a reaction is not found on the second or sixth day, the vaccination must be repeated, as either the virus was impotent or the technique was at fault.

ALBINO RATS FOR PREGNANCY TESTS

To the Editor.—We have read with interest the communications in *THE JOURNAL* in regard to the use of rabbits in performing the urine pregnancy test. We are entirely in accord with the opinion that some substitute test should be developed so that a great saving in this important food animal may be made. We also agree that even though rabbits are used for this hormone test they are still edible if they are not infected by the injected urine. As they are killed forty-eight hours after injection of the urine there has been no long time interval for the rabbits to develop any serious infection, but still there is the possibility.

It has been known for some time that the female albino rat or allied strains can be used in place of the rabbit in the performance of this test. Several articles have already appeared in the medical literature in this regard and credit should be given to Dr. Udal J. Salmon and his co-workers from the laboratories of the Mount Sinai Hospital, New York, for development of a rational procedure (*A Six Hour Pregnancy Test*, *J Clin Endocrinol* 2:167 [March] 1942). It must be stated, however, that other authors have previously reported the use of the rat in performing this test. Drs. H. M. Evans and M. E. Simpson used rats in 1930 (*California & West Med* 32:145 [March] 1930). Drs. Frederick Eberson and M. H. Silverberg obtained reliable results after thirty-six hours, using rats for injection of the urine (*Anterior Pituitary Hormone in Urine*, *THE JOURNAL*, June 27, 1931, p. 2176).

We have been studying this test for several years and have concluded that the rat is a suitable substitute for the rabbit and that there are several advantages in its use. We have just completed checking a series of 100 cases using the white rat and the rabbit in every instance. We are entirely satisfied with the results.

One word of caution, however, must be added. Experience in the reading of this test in rats is absolutely necessary, and care must be used in observation of the breeding and selecting of the rats for use.

SAMUEL BARD'S INOCULATION AGAINST SHEEP POX

Samuel Bard, the physician who directed the foundation of great medical centers in New York and who successfully treated George Washington for carbuncle paid much attention to the care and breeding of sheep particularly an imported Merino brand In 1811 he published a book¹ in which the diseases of Merino sheep mainly sheep pox (ovinia) occupy a large part By the similarity of sheep pox to smallpox he was led to experiment with inoculation against sheep pox but without success He found it difficult to inoculate the disease and when the sheep or lamb took the disease many died but then he was not certain that the disease had not been taken before the inoculation He concluded that a few took the disease from inoculation and went through the attack with safety but he does not state whether any prevention resulted He vaccinated 7 sheep with cowpox but was not sure that one took the cowpox He found the analogy between sheep pox and smallpox so close that if he should have the chance he would again attempt inoculation It should be noted that Bard did not attempt to obtain any specific vaccine against sheep pox Bard's experiment is a historically interesting early attempt to apply the principle of preventive inoculation, not vaccination, of smallpox to an animal disease

MEDICOLEGAL ABSTRACTS

Charitable Hospitals Liability for the Negligence of Servants and Agents—The plaintiff, a special nurse, while caring for a pay patient in the defendant hospital, was injured through the negligence of a student nurse employee She brought suit against the hospital, which disclaimed all liability on the ground that it was a charitable corporation and as such was not liable for the negligence of its servants The trial court ruled apparently that, while a charitable corporation is not liable to a beneficiary of its charity for the negligence of its servants, the plaintiff was a stranger to the charity and hence could recover from the hospital for its servant's negligence The hospital appealed to the United States Court of Appeals for the District of Columbia

The courts of the several American states have held every possible way with respect to the liability of a so called charitable hospital for the negligence of its agents and servants but, in the opinion of the Court of Appeals on principle a charitable hospital should be subject to liability for the negligence of its servants and agents without regard to the persons injured by such negligence For negligent or tortious conduct, said the court, liability is the rule, immunity is the exception Generally charity is no defense to tort, and one who undertakes to aid another must do so with due care The court then adverted to the fact that in many American jurisdictions when a charitable enterprise is formally institutionalized, such as by incorporation or by creating a trust, owing to a misapprehension of the law presently to be referred to, the burden of the negligence of the servant of the institutionalized charity is cast not on the charity but on the persons whom the negligence injures But when an individual human being undertakes a habit or business of charity he does not acquire such an immunity for his negligent acts or for the negligent acts of his inferior functionaries This, said the court, indeed is a strange distinction The hospital may maim or kill the charity patient by negligence, yet the member of the medical staff operating or attending without pay or thought of it dare not lapse into a tired or hurried moment.

The court then discussed the historical background of the rule of immunity adopted in so many American jurisdictions In 1846 in an English case, *The Feoffees of Heriot's Hospital v Ross*, 1846 12 Clark & Fin 507 513, 8 Eng Reprint 1508, Lord Cottenham in passing on an action for damages for the wrongful exclusion from the benefits of the charity and not for any personal injury inflicted in the operation of the charity on a beneficiary or other person said by way of dictum

To give damages out of a trust fund would not be to apply it to those objects whom the author of the fund had in view but would be to divert it to a completely different purpose

Subsequent English cases however decided in 1866 and 1871 in effect overruled that dictum Nevertheless, when the first American case involving the liability of a charitable institution for the negligence of its servants was decided in 1876 (*McDonald v Massachusetts General Hospital*, 120 Mass 432, 21 Am Rep 529) the dictum of Lord Cottenham formed substantially the basis of the decision holding the charitable hospital immune from liability in apparent ignorance of the fact that the rule was already dead in England From the Massachusetts case the doctrine spread with modifications throughout the United States The court next considered the state of the law in this respect in the United States Five states (Delaware New Mexico North Dakota South Dakota and Vermont) appear to have no decisions on the subject Eleven states (Arkansas, Illinois Kansas Kentucky Maryland Massachusetts Missouri Oregon Pennsylvania, South Carolina and Wisconsin) apparently adhere to the rule of full immunity

1 Full immunity as used by the court is used in reference to a plaintiff's ability to maintain a suit rather than whether the charity may be liable under special circumstances as for administrative negligence or when there is insurance or satisfaction may be had from business property It means therefore that ordinarily neither strangers nor beneficiaries may recover though one or both may do so in exceptional situation as indicated above

from suits. Three states (Minnesota, New Hampshire and New York) and apparently a fourth (Oklahoma) have imposed unlimited liability on charitable hospitals for the negligence of their servants; the rule adhered to in England, Canada and New Zealand. In seven states (Alabama, California, Florida, Georgia, Idaho, Oklahoma and Utah) strangers to a charity and paying beneficiaries may recover, but the question has been reserved as to nonpaying ones. Colorado and Tennessee impose liability if the charity is protected by insurance, and Tennessee, Georgia and Mississippi, and possibly also Massachusetts and Pennsylvania, apply liability to the extent of property owned by the corporation and used not directly in carrying on the charitable enterprise but for business purposes to produce income for its support. In thirteen states (Connecticut, Indiana, Iowa, Louisiana, Michigan, Nebraska, New Jersey, North Carolina, Ohio, Rhode Island, Texas, Virginia and Washington) apparently strangers are allowed to recover but beneficiaries are denied relief. In the remaining seven states (Arizona, Maine, Mississippi, Montana, Nevada, West Virginia and Wyoming) there do not appear to be any cases involving strangers but there are decisions that accord immunity to the charity for injury to beneficiaries.

The court next discussed the policies supporting and the policies against immunity for charitable hospitals. In support of immunity, and for that the following reasons are commonly advanced. Liability, it is contended, would (1) violate the corporate charter; (2) misappropriate the funds to unauthorized purposes and to persons not within the intended class of beneficiaries; (3) in effect, indemnify the trustees if the charity is organized as a trust and the consequences of their own or their subordinates' misconduct; (4) dissipate the fund in damages and deprive the favored class or the public of the charity's benefit; and (5) deter donors from creating a charity or from adding to its funds by subsequent donations. When an attempt is made to modify the rule of immunity in some of the ways previously mentioned and to reconcile the modifications with the reasons advanced for immunity, the confusion comes to a climax. The modifications from full immunity fail to take into consideration that departure from the donor's intent, dissipation and deterrence also take place equally whether damages are paid to a stranger or to a patient. The fact that in modern days insurance is available to guard against dissipation of funds takes much away from the argument that liability would tend to dissipate the charity's funds; if that argument ever were valid. However, said the court, we do not believe that holding a charity liable for the negligence of its servants would tend to dissipate its funds or to deter donations. No statistical evidence has been presented to show that the mortality or crippling of charities has been greater in states which impose full or partial liability than where complete or substantially full immunity is given. Nor is there evidence that deterrence of donation has been greater in the former. Charities seem to survive and increase in both, with little apparent heed as to whether or not they are liable for torts.

On the other hand, continued the court, we must weigh the cost of the charity's negligence to the victim, who must by himself bear the full burden of his injury. We must consider also that much of modern charity or philanthropy is big business in its field and has a capacity for absorption of loss which did not exist in the typical nineteenth century small hospital. Further, while the larger hospitals generally are not operated for profit, much of their revenue comes from paying patients. To that extent, at least, the institutions should not be regarded as charitable and the paying patient, if he is injured and cannot recover, pays twice that others may have healing where he has injury. Finally, in recent years the real deterrents to donation have been taxation and the fears of well informed persons concerning the future of large accumulations of property, which fears arise from economic trends much more fundamental than making charitable institutions liable for their torts. Among the factors calling for a policy of nonimmunity for hospitals are (1) the tendency of immunity to foster neglect and of liability to induce care and caution, (2) the departure in affording immunity from the general rule of liability, (3) the anomaly of exempting charitable corporations and trust funds when charity is not a defense to others, and (4) the

injustice of giving benefit to some at the cost of injury to others and of the injured individual's having to bear the loss wrongfully inflicted on him at a time when the direction of the law is toward social distribution of losses.

Finally, the court undertook to discuss the so-called "stranger-beneficiary" distinction which motivated the trial court as it does the courts of so many states. Such a distinction as applied by those courts renders the hospital immune with respect to injuries inflicted on a beneficiary of a charity but holds the hospital liable for injuries inflicted on a stranger to the charity. If, said the court, immunity is founded on some form of ultra vires premise, there is no room for treating strangers and beneficiaries differently. So, too, paying damages to either class constitutes violating the donor's intention and misappropriating the fund to unauthorized purposes. If the matter is regarded as diverting the fund to persons not within the class intended for aid, it is impossible to assume that the donor intends every one except the special object of his bounty to have reparation. In reason the departure, in this respect, would be the greater when a stranger recovers since the beneficiary is in the hospital as an object of help and not as one whose last state is to be made worse than his first. No more tenable foundation exists in considerations of preserving the charitable fund, preventing its dissipation, depriving the intended class or the public of its succor, cutting off creative or sustaining donations and the like. The reasons already stated to show that these do not support unlimited immunity apply with equal force to a limited one whatever its form or extent. If damages dissipate the fund or deter donations, they do so equally whether paid to a stranger or to a beneficiary. When account is taken of the numbers in both classes and the probable burden of risk toward each the heavier risk perhaps is incurred in favor of strangers. The distinction contended for by the trial court favors at the expense of the only person the fund is created and maintained to aid. He alone is excluded. If preservation of the fund or encouragement of donation required immunity, neither could justify the distinction between stranger and beneficiary. If the charity can assume the risk as to all the rest of the world and survive it can do so for those it is designed to help. Finally, the idea of waiver is advanced, namely, that the beneficiary by accepting the tendered and impliedly agrees that that is all he may accept and waives any right of recourse for wrong done, while strangers do not do so. The notion that there is any such agreement or waiver is entirely fictional. Usually the beneficiary is ill or hurt, he does not haggle about terms, he expects care, not carelessness. Few hospitals would announce a policy of requiring such a waiver as a condition of entrance, and few patients would enter under such a condition unless forced to do so by poverty. In that case there could be no real choice. The idea of waiver, therefore, as implied from reception of benefit, amounts merely to imposing immunity as a rule of law in the guise of assumed contract or renunciation of right when all other reasons are found insufficient to support the distinction.

The court accordingly concluded that an incorporated charity should be liable for the injuries inflicted by reason of the negligence of its servants and agents. The judgment in favor of the private nurse was accordingly affirmed.—*President and Directors of Georgetown College v Hughes*, 130 F (2d) 810 (1942)

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1942 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Milk Borne Outbreaks Due to Hemolytic Streptococci

—During April 1942 a small milk borne outbreak of infection of the throat due to the hemolytic streptococcus occurred in a relatively isolated rural community of approximately 275 inhabitants. Incriminating milk was secured from a large cheese plant handling milk from three hundred and fifty-six producers. The outbreak involved 44 or 18 per cent of 239 persons included in the study group. 77 per cent of the cases occurred in persons 15 or more years of age. 61 per cent of whom were males. All the cases occurred during three weeks. There were no deaths. Scarlatinal rashes were observed in 8 and since the causative organism was able to elaborate erythrogenic toxin, it appears illogical to distinguish between cases of septic sore throat and scarlet fever. Articular manifestations (pain and limitation of movement) were experienced by 16 patients but some also complained of severe polyarthritides with swelling redness and tenderness about the joints. In 4 the migratory articular involvement clinically suggested active rheumatic fever, in these patients one to two weeks elapsed between throat symptoms and the articular manifestations. Throat cultures were secured at the time of or shortly after the acute episode from 35 of the 44 patients. The cultures of 23 yielded hemolytic streptococci; those of 17 were identified serologically as Lancefield group A, of 2 as group B, of 3 as group D and that of 1 could not be classified. Although the cheese plant handled milk from 6069 cows it is believed that the cow responsible for the outbreak was located by means of Breed smear examination of cans of milk received at the plant and subsequent veterinary and bacteriologic follow-up of suspected herds. On the involved farm, prior to the outbreak there had been 1 case each of scarlet fever, sore throat and so called grip. The suspected cow had suffered an injury to a leg followed by acute mastitis on manipulation of the injured part by the person with the sore throat. Hemolytic streptococci obtained from the throats of the people on the farm and from tissue from the udder of the cow

at necropsy were of type 3. To prevent any possibility of transmitting infection through the cheese, that produced during the outbreak was embargoed and released only after it was reprocessed by a method involving its being heated above 170 F for several minutes.

Roentgen Examination for Tuberculosis—A review of the routine roentgen examination of 114,130 national guardsmen and selective service registrants in the Southern New York District of the Second Corps Area from Nov 25, 1940 to April 1, 1941, Ehrlich, Schiller and Edwards point out, discloses that 1,304, or 1.14 per cent, were rejected under MR 1-9. Of these 1,156, or 101 per cent, were classified as chronic pulmonary tuberculosis. 435 as clinically significant and 721 as arrested. A subsequent complete study of the rejected men by the New York City Health Department revealed that the percentage reclassified as acceptable for army service after previous rejection on the basis of the paper film was half that of those disqualified on the basis of the 4 by 5 inch film. This evidence suggests that the screening by the 4 by 5 inch photoroentgenogram required greater conservatism in interpretation than the 14 by 17 inch paper roentgenogram. The financial saving to the government in the elimination from service of those with known tuberculous lesions may be estimated at \$13,000,000. Because of the cooperation that the Southern New York Army Physical Examination Team has had from the Bureau of Tuberculosis of the New York City Department of Health in studying and following up the rejected registrants, it has been possible to reclaim subsequently a small but definite percentage of the men initially rejected because of suggestive shadows or of those who had bronchopneumonia which was only temporarily disqualifying.

Pulmonary Manifestations in Extrapulmonary Tuberculosis—To determine whether a characteristic roentgen picture can be formulated and recognized as of hematogenous origin and whether or not such knowledge can be of practical import to the clinician in his management of tuberculosis Tepper and Jacobson studied the roentgenograms of 100 patients with extrapulmonary tuberculosis who had had one or more chest films. They were seen in the wards or clinics from 1930 to 1941. Excluded from the study were patients less than 15 years of age and persons with tuberculous laryngitis enteritis meningitis and tuberculosis of the skin and eye. For comparison another 100 adults with pulmonary tuberculosis but with no clinical evidence of extrapulmonary tuberculosis were reviewed. In the first group 79 showed roentgen evidence of post-primary pulmonary involvement. The pulmonary lesions were fibrotic and calcific apparently inactive with proliferative nodular and exudative manifestations decreasingly common in this order. The tendency of these lesions toward bilateral symmetrical, apical and subapical distribution in 44 of the 79 suggests a hematogenous origin and emphasizes the systemic nature of the disease. There was roentgen evidence of cavitation in 15. The cavities were mostly thin walled with bilateral symmetrical distribution. Although the patency of 12 was positive only, 1

showed evidence of bronchogenic spread. When multiple films were available, stability or regression of the pulmonary lesion and the absence of bronchogenic spread were the principal features. The chest films of the other 100 patients emphasized the acute exudative viscous nature of adult pulmonary tuberculosis with its tendency to bronchogenic spread. A few of the patients in the control group exhibited a pulmonary picture similar to that in those with known extrapulmonary foci. The ability to recognize the chronic disseminated or hemitogenous form of pulmonary tuberculosis should be of value in prognosis and treatment to both the surgeon treating extrapulmonary tuberculosis and the tuberculosis specialist.

Ventricular Tachycardia—The 36 cases of proximal ventricular tachycardia that Williams and Ellis report are believed by them to be the largest series from one hospital. The cases were found among approximately 61000 electrocardiograms made during twenty years. The electrocardiogram of 24 of the 36 revealed the attack to be uninterrupted, while in 12 the attacks were short and the periods interposed in between showed normal supraventricular conduction. These two types have been arbitrarily designated as 'persistent' and 'intermittent' tachycardia. Organic heart disease was present in all but 1 patient. In 28 it was of the degenerative type. Digitalis intoxication was clearly associated with the attack of 8, and it was the probable precipitating factor in 9 others. One patient had received large doses of both digitalis and quinidine prior to the onset of the attack. Attacks occurred in association with myocardial infarction in 6 and myocardial infarction was probably present in 3. Twenty-one patients died in the hospital, 8 during the attack and 12 (all but 1 of the remainder) within a month of its cessation. The prognosis is serious, but it is essentially the prognosis of the associated heart disease. The prognosis of the "intermittent" type was somewhat better than that of the "persistent" type.

Erythrocytes in Fetal Erythroblastosis—Reisner tried to determine to what extent the blood picture in fetal erythroblastosis simulates the picture seen in experimental anemias due to autoantibodies. He made Price-Jones curves on the cord or peripheral blood of 12 cases of fetal hydrops and 12 of icterus gravis at the onset of illness. In 23 a characteristic biphasic curve, consisting of a normocytic and a macrocytic peak or two macrocytic peaks, was observed and in 1 a monophasic microcytic curve was observed. A blood smear in this last case revealed spherical microcytes, but three months later the smear was normal. The morphologic changes in the erythrocytes in fetal erythroblastosis resemble in some respects those observed in experimental hemolytic anemias due to antigen-antibody reactions. Examination of the blood smears of 6 cases of severe fetal erythroblastosis revealed varying numbers of megaloblasts, and postmortem examination of 4 cases revealed varying degrees of hepatic damage. The presence of megaloblasts and the macrocytosis, in part at least, may be the result of a deficient erythrocyte maturation factor due to hepatic damage. The blood destruction in the disease is believed to be best explained on the basis of an antigen-antibody reaction in the fetus. The hepatic damage may possibly be due to the same cause.

- Review of Allergy for 1941. F. I. MacQuiddy, Omaha—p. 440.

Facial Palsy of Otitic Origin—The material on which Kettel bases his report was compiled in the Municipal Hospital in Copenhagen, and the 264 records comprise all the patients with peripheral facial palsy caused by acute suppurative otitis media admitted between 1906 and January 1938. No patient was observed for less than one year. Of the 264 patients 169 were reexamined, the rate of only 20 was unknown. When the reexamined patients are divided into those whose paralysis disappeared completely, those whose paralysis had apparently disappeared (being in evidence only during movements of the facial muscles but not in repose) and those whose paralysis had left its distinct marks on the face even at rest, it is seen that the majority of the conservatively treated patients fell into the first two groups.

Periarthritis Nodosa and Hypersensitivity—Rich and Gregory produced periarthritis nodosa in all of its details in rabbits by creating conditions similar to those obtaining in serum sickness in the human being. The aural flush and the rise in body temperature that occurred in rabbits a week after the injection of foreign serum were believed to be analogous to serum sickness in man. The widespread destructive vascular lesions produced in the rabbits exhibited all the characteristics of periarthritis nodosa. Actual aneurysm formation was not encountered, but it is often absent in human periarthritis nodosa. In many vessels the condition necessary for aneurysm formation was demonstrated. Had hypertension been present, the totally necrotic segment of the wall would have given way. The other local complication of periarthritis nodosa which occurs in some human cases, i. e. infarction from vascular occlusion, was encountered only once among the animals. The experiments demonstrate that periarthritis nodosa is one manifestation of anaphylactic hypersensitivity. Clinical and pathologic evidence supported by the experiments shows that widely different types of sensitizing antigens can cause periarthritis nodosa in man and suggest the advisability of attempting to discover and to eliminate the responsible antigen in each case so diagnosed. Acute diffuse glomerulonephritis occurred in a few animals in which a hypersensitive reaction developed to the foreign serum. This supports the view that some cases of glomerulonephritis in man may be due to hypersensitivity.

Acute Respiratory Disease and Pneumonia—Iverson reports the occurrence of an epidemic of primary atypical pneumonia of unknown cause in a boys' camp in Maine between July 22 and Aug. 14, 1942. At the same time numerous cases of respiratory disease varying from a mild common cold without fever to the severe picture of atypical pneumonia, except that no pulmonary involvement was demonstrated, were observed. A common etiologic agent was believed to be operative in most

of both types of cases. Councilors estimated that 60 to 80 boys of the 100 of the camp group suffered with cough during eight weeks. 35 with respiratory disease and fever were confined to bed. In these 35 most cases over the pulmonary fields developed in 15 and 7 showed definite x-ray evidence of atypical pneumonia. The 28 with respiratory disease with fever but without x-ray evidence of pneumonia were ill for as long as seventeen days. Although to a lesser degree, these patients had about the same symptoms as those with pneumonia: severe paroxysms of coughing in several, nausea, vomiting, dizziness, and epistaxis; most cases in 8, sibilant rales in 4, conjunctivitis and tympanic congestion in a few and easier breathing than in the pneumonia group. During the camp period of eight weeks 8 boys became ill with chickenpox. The epidemic had a higher rate of incidence among the younger boys and in the dormitory rooms of the younger boys. It cannot be determined whether age or housing played the greater part. Presumably the disease was spread by contact. There was no evidence that birds or insects were agents of transmission. A long incubation period (six to thirty days) for the disease is suggested by the close contact of 12 boys for four days, 6 of them became ill.

Observations on Body Heat in Engine Room.—To determine how rapidly a man's temperature increases in a saturated atmosphere and whether heat, humidity and poor ventilation have a deleterious effect on the affected ratings. Chambers recorded the oral temperature and pulse rate of ratings employed in the hotter parts of a ship. The ship was in the vicinity of Trinidad and in Port of Spain when the readings were obtained. The only unusual occurrence the readings revealed was a slight increase in pulse rate. The heat and humidity with the present system of ventilation seemed to have no harmful effect on the robust and physically fit stoker or galley worker. The ventilation could be improved.

Incidence of Enterobiasis in Toronto.—Of 300 children and 50 adults examined for enterobiasis, Kuitunen, Ekbaum found respectively 60 and 52 per cent to be infected. The highest incidence was among the age groups 6 to 11 years and

the incidence was higher in girls than in boys. In the youngest age group most of the infected children were 2 years of age. Only 1 child less than 1 year of age had the parasites. Of 34 families examined comprising 139 persons, all or most of the members of 29 families were infected. In 26 of the families every child was infected.

Retention of Vitamins in Meat During Cooking.—McIntire and his co-workers report on the retention of thiamine, riboflavin and nicotinic acid in samples of pork ham and loin cooked under standard conditions. The average retention of thiamine in the meat alone is 70 per cent after roasting and broiling and 50 per cent after braising. For nicotinic acid it is 85 per cent after roasting and broiling and 65 per cent after braising and for riboflavin it is 85 per cent after any of the cooking methods. The total retention in the meat and the drippings is about the same for all the methods: an average of 70 per cent for thiamine and at least 90 per cent for riboflavin and nicotinic acid. An appreciable amount of each of the vitamins is found in the drippings, particularly in drippings from braised loin cuts. There is a wide variation in the thiamine and riboflavin content of different pork carcasses; nicotinic acid is more constant.

Sterile Pyuria—Moore studied the records at the clinical laboratory at the Manchester Royal Infirmary for a period of thirty months. He found that 78 patients had urines which contained pus cells but proved sterile on culture. In addition 2 from another hospital have been added as they are examples of true infective abacterial pyuria. The cases are divided on an etiologic basis into three groups: noninfective, infective with organisms demonstrable on direct microscopic examination of the centrifuged urinary deposit with the urine sterile on culture, and infective cases in which no organisms can be demonstrated by any method. The recurring trouble of a calculus in the urinary tract would be expected to give rise to sterile pyuria. An inflammatory focus outside but adjacent to the urinary tract did not give rise to any instance of sterile pyuria. In such cases the inflammatory exudate at the periphery of the inflammatory lesion is due more to the toxins exerted by the sensitive bacteria than to the bacteria themselves. When the inflammation affects contiguous structures the exudate may be free from organisms. Such sterile pyuria may occur when an abscess is in contact with but outside the kidney, renal pelvis, ureter, bladder or urethra. In the infective group the organisms of the bacterial infection of the urinary tract during the later stages, present in the urine have been so altered either by the tissue reaction or by treatment that they may fail to grow. There were 24 cases of urinary tuberculosis in the series. This is the most common cause of sterile pyuria, and it has become almost axiomatic that sterile pyuria indicates urinary tuberculosis. In all these cases the bacilli were demonstrable on microscopic examination of the urinary deposit and by special methods. In the 9 cases of the last group the infection of the urinary tract had been overcome, but the inflammatory cells had not, at the time of the examination, disappeared from the urine. Within a short time the pyuria in these cases disappeared. The excretion of organisms may be intermittent. Autosterilization was found only when the lesion was resolving. In a study of acute cholecystitis Gray has found that in cases of long standing the pus in the gallbladder is often sterile. In cases of carcinoma of the bladder, in the absence of bacterial infection, hematuria is usual. However, organisms are likely in the necrotic neoplasm and this may lead to inflammatory changes with resultant pyuria. In 2 such cases there was no infection but the pyuria was understandable. Neoplastic invasion often leads to some inflammatory tissue reaction and, if it is growing so rapidly that necrosis occurs, the dead tissue is probably a more potent inflammatory stimulus. In 5 patients with subacute prostatitis it was possible for inflammatory changes at the periphery of the gland and the base of the bladder to be due more to their toxins than to the bacteria themselves, therefore sterile pyuria may be expected sometimes. The most important and more common than is usually recognized type of sterile pyuria is true infective abacterial pyuria.

Incidence of Pyelonephritis in Successive Pregnancies—The 68 cases of pyelonephritis associated with pregnancy, a portion of 1,000 cases of pyogenic infection of the urinary tract followed and treated in the Department of Urology of the New Haven Hospital during the last twenty years, were personally treated by MacLean and Deane, and for the larger group they acted solely as consultants without the privilege of directing the therapy. Among the 68 there were seventy-four infections, sixty-five infections developed during pregnancy and nine post partum. One third of the infections occurred in the fifth and sixth months of pregnancy and nearly two thirds in the first and second pregnancies. There were five complications: one unilateral double kidney and ureter, one bilateral double kidney and ureter, one renal calculus, one anterior poliomyelitis and one death. The colon type of bacillus was the most common infecting organism and staphylococci the next. The bacteriology of cultures agreed with that of stained smears in 72 per cent of the cases. Pyogenic infection of the urinary tract during pregnancy is not in the authors' opinion an indication by itself for abortion. There is no association between the month of pregnancy at which the infection occurs and the ability to reach term provided conservative treatment is used, 85 per cent of the patients were carried to term or until the fetus became viable by conservative therapy, and of these 90 per cent were delivered of living infants. It is established that pyelitis reduced phenolsulfonphthalein test confirms pyelonephritis. The incidence of hypertension in the group was 27 per cent, this was no higher than that which occurs in any other group of cases of pyelonephritis not complicated by pregnancy. An acute infection of the upper part of the respiratory tract often immediately preceded the onset of the urinary infection. Dilatation of the ureter also was common. Mandelic acid and the sulfonamides were most effective in combating the urinary infection. The range of organisms for which they were effective was greater than that of any other single drug used. Therapy was given until the patient was either "cured" or delivered, only 25 per cent were "cured" at term, but within two weeks of delivery 90 per cent were asymptomatic and free from infection.

Sulfadiazine Reactions in Urology—Among 500 consecutive patients in the urologic service (300 hospitalized and 200 outpatients) given sulfadiazine to combat infection, Satterthwaite encountered fifty-eight reactions to sulfadiazine. Thirty-two toxic reactions occurred among the hospitalized and twenty-six among the outpatients, all yielded promptly to treatment (withdrawal of the drug and the forcing of fluids) and there were no fatalities. The toxic reactions were usually multiple and consisted of conjunctivitis, arthritic pain, severe anorexia, itching, dizziness, severe disorientation, severe nausea, severe nausea and vomiting, headache, dermatitis, hematuria with or without urinary concentrations and renal colic, leukopenia and partial suppression of the urinary output. Leukopenia, the most severe reaction to sulfadiazine therapy, develops not earlier than the third day and usually in the second week of treatment. The use by outpatients of a printed set of precautions has reduced the incidence of toxic reactions.

Biologic False Positive Tests for Syphilis—According to Arthur and Hale, the Kahn test of 14 of 94 men who had been recently vaccinated against smallpox and who also had received typhoid vaccine and tetanus toxoid showed more or less temporary changes. The changes in 4 appeared in the baseline Kahn test done at the beginning of the experiment and 2 of the men even showed a positive Wassermann reaction. It is probable that these reactions were influenced by the injections

received previously. All the serologic changes were temporary and faded out to normal negative reactions within six to seven weeks (one eight weeks) of the last injection. Tests at another laboratory also were negative. Physical examination of each man revealed no clinical evidence of syphilis. One man whose Kahn test was persistently negative was hospitalized for jaundice. Another man, who had changes in his baseline Kahn and Wassermann tests was released from service because of physical disability. His serum had turned negative according to the Kahn test but no final Wassermann test could be obtained. It appears that the army routine immunizations were responsible in 14.8 per cent of the cases for a temporary change in the normal negative Kahn reaction. It is during this period that an unfortunate diagnosis of syphilis may be made.

Treatment of Angina Pectoris with Testosterone Propionate—Lesser reports successful results with testosterone propionate in the treatment of 46 patients with angina pectoris. Four patients of the group were studied by means of exercise tolerance tests before and during the course of therapy to obtain quantitative measurements of their improvement. Each patient exercised until an attack of angina pectoris was precipitated. The amount of work done before the development of an anginal attack was increased under testosterone therapy, and the severity of attacks as measured by the duration of the pain, was correspondingly diminished. Subjective improvement was reported before quantitative changes could be demonstrated. Testosterone propionate does not give immediate relief from an anginal attack as does glyceryl trinitrate. Further, improvement as to time and degree varies with the individual patient. Some patients experienced improvement after the second or third injection of testosterone propionate others not until the eighth, ninth or even tenth injection and still others required as many as fifteen to twenty-five injections over a period of months before therapy could be discontinued. An average of twenty-eight days elapsed before quantitative improvement was observed, and forty-three days elapsed before this improvement became decided. Not enough time has as yet elapsed to determine the permanence of the beneficial effects of testosterone propionate therapy. In a previous study this varied with the individual patient two to eighteen months. Patients who returned for further treatment because of a recurrence of pain stated that their attacks were less severe than originally, also fewer injections were required to control them.

- Vascular and Neurologic Lesions in Survivors of Shipwreck I Immerman Foot Syndrome Following Exposure to Cold J C White—p 211
Fiedler's Myocarditis Report of Case H F Engelhardt and F E Bruno New Orleans—p 222
Respiratory Failure in Acute Poliomyelitis C Weisskoff Boston—p 225

Vascular and Neurologic Lesions in Survivors of Shipwreck—White has seen in survivors of shipwrecks painful swelling of the lower extremities occur after exposure to the cold water of the North Atlantic in the winter as well as after

exposure to the warm water of the Gulf Stream in April and May. In the true immersion foot syndrome after relatively brief exposure of the lower extremities to cold water there exists actual thermal injury to the skin and subcutaneous tissue. This feature is not present after prolonged exposure in warm southern waters; the painful swelling of the dependent parts in these cases is caused by a systemic disturbance. The inflammatory hyperemia, which reaches its height on about the third day after exposure, gradually disappears in a fortnight. The complete cutaneous anesthesia below the ankles in mild cases clears rapidly on warming but in the severe cases the anesthesia of the toes persists at the end of a fortnight and sensation over the remainder of the foot is reduced. The speed at which sensory recovery takes place over the dorsum of the foot is too rapid for nerve regeneration and is evidence that the majority of nerve fibers never actually degenerate. The fact that patients continue to suffer after their circulation has become normal suggests that the pain is neuritic, especially in the late stages. During the acute phase this may not be the entire reason. Rescued victims state that they are comfortable when the temperature of their feet is kept below 50 F. The probable disparity between the supply of blood to the tissues and the demand for oxygen on the part of the tissue cells constitute strong arguments for therapeutic cooling of hyperemic painful feet during the early stage of the postimmersion reaction. The common denominator in all conditions that follows thermal insults is injury to the blood vessels and nerves. For prevention all ship officers and seamen should be acquainted with the dangers of exposure to cold air and cold or even warm water. Much can be accomplished by emptying boots periodically and putting on another pair of socks, even previously wet socks that have been wrung out and partially dried. Frostbite of the hands and feet may be prevented by greasing them. Movement of the cold benumbed and dependent extremities, even temporary elevation and avoidance of constricting pressure on the legs from clothing or boot laces are helpful preventive factors. The immediate local treatment is the same whether a person has suffered actual freezing or the less severe chilling or immersion foot. The extremity should be exposed, kept cool, elevated slightly above the level of the heart and cleaned surgically. The rationale of treatment is to reduce tissue metabolism. For the most intense stage of hot congested feet and when the neuritic pains are severe fanning or a cool atmosphere are not sufficient and ice packs are required. After the intense hyperemia has subsided exposure of the legs to room air or at most to the breeze from an electric fan assures comfort. At night the neuritic pains may increase and the reapplication of ice packs may be necessary. Burger's exercises prior to getting the patients out of bed are advocated. A diet high in protein and vitamin B is often helpful. Crushing the peripheral nerves through small incisions above the ankle for the relief of intractable pain in severe cases of neuritic pain might be of value. This incapacitates the subject for duty for three months. The author fails to see how blocking the sympathetic outflow to the lower extremities by paravertebral injections of procaine hydrochloride and by lumbar sympathectomy in the acute stage can result in any possible improvement. Absence of sweating proves that the terminal vasoconstrictor fibers are already interrupted. Lumbar sympathectomy is likely to be of value only in the late stage when the circulation remains insufficient. The neuritic pain, which appears with partial recovery of the nerves, continues until nerve function is restored.

Clinical Biotin Deficiency R. H. Williams, Boston—p 247
Endoscopy E. B. Benedict, Boston—p 253

Survivors of Shipwreck—White discusses the painful swelling of the feet of the crews of two lifeboats adrift for long periods in the Gulf Stream. There were fundamental clinical and etiologic differences from the "immersion foot" syndrome which develops in survivors of vessels lost in waters of the North Atlantic. Edema of the feet due to prolonged dependency and immobility was present in both groups. In the case of survivors torpedoed in the North Atlantic, additional

swelling and neuritic pain were caused by direct thermal injury to the skin, cutaneous capillaries and nerves by immersion in cold water. Immersion in warm water by itself cannot account for either the edema or the pain. Therefore this syndrome should not be classified as immersion foot, as direct thermal injury can be excluded. Hypoproteinemia from starvation was an additional cause of swelling in these survivors. Such edema is not generally considered to be painful. It is postulated, but not proved, that the stomatitis, sensory disturbances in the hands and feet and plantar tenderness that developed in these patients were caused by a deficiency of the antineuritic factor and other components in the vitamin B complex. Such a deficiency may occur at a greatly accelerated rate in the rapid tissue oxidation reactions that take place in men doing hard physical work in a hot climate on an extremely inadequate intake of fluid. An added deficiency in vitamin K was suspected in 3 of the men in whom the prothrombin times were determined. Loss of blood in the stools was common. The possibility that a deficiency of vitamins B and K may develop as a complication of shipwreck in a brief period as two and a half weeks has not been suggested heretofore.

Congenital Cystic Disease of Lung—In view of the fact that congenital cystic disease of the lung is not common and that its surgical treatment is relatively new, Rumel cites 4 cases in which such intervention was successful. The pathologic and clinical picture in each instance was entirely different and therefore the surgical procedure varied. The unilocular cyst of 1 patient was incised, in 2 complete pneumonectomy was necessary and in 1 intrapleural poudrage was carried out. All the patients recovered and have been relieved of their symptoms.

Pulmonary Tumors in Mice and Man—Campbell has exposed mice once an hour for six hours five days a week for a year to a moderate cloud of the various substances (coal gas and tar, tobacco, metal dust, silica, chromate and pitchblende) that apparently increase man's susceptibility to pulmonary cancer. Of the many substances tested, the statistical evidence in favor of the particular dust increasing the incidence of pulmonary tumors is highly significant for tarred road dust, a similar dust with carbon monoxide and also for a dust mixture containing equal parts of silica, iron oxide, alumina and calcium carbonate. The increase in incidence of pulmonary tumors in the experimental mice also was definitely significant with iron oxide. Czechoslovakian pitchblende dust containing a small quantity of radium and arsenic tarred road dust from which the tar had been removed by benzene and tarred road dust. Experiments in which the increase in incidence was on the borderline of significance include a diluted 'nickel' dust mixture, a bituminous coal dust and Czechoslovakian pitchblende dust containing no arsenic and practically no radium. Experiments in which the increase might have been due to chance included those with exhaust soot steel grindings and silica and iron. No material difference in incidence was observed with an anthracite coal dust and coal soot from a chimney. This increase in incidence in mice by certain dusts directs that care should be taken to reduce the exposure of man to these dusts. Dusts produce a hypertrophy of lymph tissue in the lungs and in the tracheobronchial lymph nodes. There appears to be no fundamental reason why the results obtained in the experiments in mice should not apply to man.

Vitamins and Physical Fitness—Harper and his associates investigated whether the fitness of university students has diminished since the beginning of the war as the result of a deficiency in the average student's diet. The effects of adding vitamin supplements to the diet of one group were studied. Certain anthropometric data, physical efficiency tests and the incidence of minor ailments were used as a basis of comparison with a control group. The experiment was performed on 69 cadets over a period of twenty-one weeks (April 18 to Sept 11, 1942). The authors found that the cadets receiving vitamin supplements were less susceptible to minor respiratory and gastrointestinal complaints than those receiving control tablets which contained no vitamins. The group receiving vitamins showed a greater increase in resting vital capacity and in breathholding and endurance times and had a faster resting pulse rate than the control group.

Amphetamine Sulfate and Electrically Induced Convulsions—Bailey raises the question of the cause of the heightened threshold in certain types of cases. Investigation showed that the threshold increased with age. Depression is more

commonly found in older age groups. Two possibilities exist (a) that certain forms of depression raised the threshold per se or (b) that age alone has this result. It is impossible to say definitely which factor operates the more strongly. Amphetamine sulfate, being a known cortical stimulant, was utilized in an attempt to lower the electrical convulsion threshold, it was effective, and smaller strengths of electricity could be used. The author thinks that it exerts its effect centrally rather than by peripheral changes, such as the heightened blood pressure. The possibility of the achievement of the central action by a process of 'substrate competition,' as suggested by Gaddum in the case of ephedrine, was advanced. In two cases there was some postconvulsion excitement. This was never very great and may not have been due to the drug, since such excitement has been present after the convulsion when the drug was not employed. No other undesirable effects were observed from the use of the drug even the patient with a blood pressure of 210/120 appeared to suffer no harm from the doses given.

Renal Atherosclerosis and Hypertension—Richardson attempted to determine the incidence of lesions which might cause narrowing of the main renal arteries and their relation to essential hypertension in 32 consecutive necropsies on patients with essential hypertension and 113 without hypertension. In 25 of the 32 there was apparent stenosis of one or both main renal arteries by atherosclerotic plaques. In 22 of them the plaques were confined to a short segment of each artery near the aorta. In 2 the plaque was confined to one renal artery immediately proximal to the bifurcation and one renal artery showed no narrowing in the main trunk but the inferior branch of the primary division was definitely stenotic. In 8 the plaques were associated with a generalized atherosclerosis. In 12 an atheroma was limited to the aorta and in 5 no nodular atheroma was discovered. In the remaining 7 of the 32 there were no sclerosing lesions of the main renal arteries. In the 8 with unilateral stenosis microscopic examination failed to show any difference between the ischemic and the nonischemic kidney. Among them there were 3 with malignant hypertension. Afferent arteriolar necrosis occurred with equal frequency in the 10 kidneys. In 105 of the 113 without a history of hypertension the main renal arteries exhibited no lesions and in 3 athero-

sclerotic plaques were present, in 6 they were unilateral. The degree of occlusion was comparable to that seen in essential hypertension in only 3. Accessory renal arteries were present in 6. It is suggested that atheromatous plaques may be capable of producing renal ischemia and consequent hypertension analogous to experimental hypertension.

Histologic Reactions to Oils and Sulfonamides.—According to the experimental evidence presented by Hawking, application of oil to a wound is not recommended unless the oil will not become embedded in the tissues. This can be assured only by incorporating the oil in a picking or layer of paraffin which is later removed *en masse*. Oils which become embedded eventually cause a reaction of the connective tissue. Any immediate advantage (nonsticking of dressings and improved drainage) to be gained from the presence of oil must be weighed against the danger of a delayed reaction. The least provocative of the oils tested was cottonseed oil, which excited only a thin covering of fibrous tissue without further overgrowth of the adjacent cells. Judgment by the microscopic reaction provoked the preparation of choice would be a microcrystalline suspension of a sulfonamide. A suspension of sulfathiazole is the best sulfonamide available because of its greater stability and greater bacteriostatic activity. The disadvantage of the sulfathiazole preparation lies in its present limited supply. Its best substitute would be the aqueous preparation of sulfamonomethoxyl. For extensive wounds it would probably be advantageous to reduce the sulfamonomethoxyl concentration to 10 or 15 per cent to avoid toxic symptoms from too rapid absorption. Only preparations of the sulfonamides suffer from the same defects as the oils which compose them.

- Suppurative Meningitis in Infants. G. Garcia Montes, B. Sanchez Salas and R. Vales Diaz—p. 16

Heart Block in Children.—Perez de los Reyes and his collaborators report a clinical and electrocardiographic study of 50 children between the ages of 1 and 12 years with heart block of various types such as sinoatrial, simple partial and complete auriculoventricular and bundle branch block. The patients were observed in a group of 1,200 children examined in a municipal department of cardiology in Havana. Heart block of these types was congenital in 14 cases and of infections, nutritional or toxic origin in the remaining ones. Rheumatic fever was the causal factor of auriculoventricular block in 26 of 29 children with this type of block. In 3 cases the block appeared after typhoid, suppurative pericarditis and streptococcal infection respectively. Avitaminosis, sickle cell anemia and ancylostomiasis were predominant causes in 5. Digitalis intoxication was the causal factor in 2. The Adams-Stokes syndrome was observed in 3 cases with complete auriculoventricular block either congenital or rheumatic. One of the patients died during a convulsive crisis. No instances of arrhythmization block were observed. A prenatal diagnosis of partial or complete auriculoventricular block can be made when there is a diminution in the number of heart beats. The diagnosis is confirmed after birth. This possibility was established by American authors.

- *Cardiac Anoxemia Caused by Inhalation of Gaseous Mixtures. M. Sloer—p. 857

Cardiac Anoxemia.—Sloer examined electrocardiograms of 30 persons, either normal or with heart disease, in the course of induced anoxemia. A mixture of 10 per cent oxygen and 90 per cent nitrogen was used. The electrocardiographic changes were as follows: There was a diminution of the T wave in the electrocardiograms of 4 out of 8 normal persons, in

8 out of 13 patients with moderate heart disease and in 7 out of 9 patients with subacute or grave heart disease. There was a deviation of the S1 segment in 2 out of 8 normal persons, in 3 out of 13 patients with doubtful heart disease and in 6 out of 9 with heart disease. Acute anginal pain developed during the induced anoxemia in 3 patients with a history of anginal pains, in 1 patient with bundle branch block and in 1 with syphilitic aortitis. The pain was controlled by administration of pure oxygen. The electrocardiographic changes caused by induced anoxemia could be controlled by inhalation of pure oxygen one minute after the induced anoxemia. The degree of the electrocardiographic change in cases of doubtful or grave heart disease corresponded to the acuteness of the disease. However, cardiac anoxemia cannot be used as a test of coronary insufficiency because alterations of the same type, although to a different degree, are to be seen in the electrocardiograms of normal persons as well as of those with doubtful or grave heart disease. Electrocardiographic alterations in the course of induced anoxemia are caused by a myocardial reaction to metabolic substances accumulated in the structure, whereas anginal pain is caused by irritation of the nerves of the coronary vessels.

Trachoma. Its Prophylaxis in Argentina.—According to Sent, about 15 per cent of the population of the world have trachoma. No country in the world is entirely free from it. It is a disease of poverty, promiscuity, unhygienic living conditions and poor food. The diagnosis of trachoma is difficult. Numerous diagnostic aids have been suggested, such as the complement deviation test, eosinophilia, the phytotoxin test of Macht, the lysozyme titer in the lacrimal fluid, Abderhalden's reaction and the Weil-Felix reaction, but none of these have fulfilled the hopes placed in them. The diagnosis is chiefly clinical and is based on the presence of follicles in the tarsal conjunctiva, the presence of pannus, the appearance of cicatrices and palpebral and tarsal alterations such as entropion and trichiasis. The treatment is local as well as general. Measures which aim at improvement in the general health should not be neglected. In the incipient forms of trachoma in children mild eye washes of zinc or copper sulfate are used. The therapeutic armamentarium against the more severe forms includes copper sulfate, silver nitrate, chaulmoogra oil and mercuric cyanide. Physical methods include cauterization and diathermic coagulation. Mechanical methods such as massage, brushing and curettage aim at the rapid destruction of the trachomatous follicles. Biologic methods occasionally used are autoserotherapy and vaccine treatment. Cicatricial trachoma requires surgical treatment. Opinions are divided as to the efficacy of the sulfonamides. They are of great value in the complicated forms. The disease is most prevalent and practically endemic in the northern and subtropical parts of Argentina, where it is favored by climatic, social, sanitary and economic conditions. It is not autochthonous for these regions but was brought in by immigrants, chiefly from the Mediterranean countries. Trachoma of children is best combated in the schools. This has been done in recent years with the aid of visiting nurses. Ophthalmologic dispensaries should provide free treatment for adults. Since 1936 the National Department of Health has provided anti-trachomatous drugs to the dispensaries and schools. Mobile medical ambulances would be helpful in bringing treatment to patients in the rural regions. Popular publications, illustrations and moving pictures are valuable in disseminating information regarding the prophylaxis of the disease.

Symphysiotomy for Contracted Inferior Plane of Pelvis.—Nolting and Peña Mendez show that pelves contracted in the median and inferior planes are most benefited by symphysiotomy. They describe 6 cases in which dystocia was the result of transverse narrowing in the inferior planes of the pelvis and in which symphysiotomy solved the problem.

Book Notices

Chemotherapy of Gonococcal Infections By Russell D. Herrold, B.S. M.D. Associate Professor of Surgery (Urology), College of Medicine, University of Illinois, Chicago. Cloth Price \$3. Pp. 137. St. Louis: C. V. Mosby Company, 1943.

In this first edition of his monograph Herrold gives a timely presentation of the application of sulfonamide therapy to gonococcal infections. The advent of chemotherapy five years ago revolutionized the treatment of gonorrhea and removed it from the exclusive domain of the venereologist. This book now also has practical value to the internist, the general practitioner and the gynecologist as well as the urologist. The author suggests that if gonorrheal treatment is to remain in private practice physicians must become familiar with epidemiologic measures and cooperate with health authorities as is done in other infectious diseases.

The book is based on the author's experience in 800 cases treated with sulfathiazole and an additional thousand treated with azosulfanamide, sulfanilamide, sulfacetamide, sulfapyridine, sulfadiazine, dimethyldisulfanilamide (Uliron), sulfanilyl sulfanilamide (Disulon) and sulfamethylthiazole. The author does not concern himself with the bacteriology, pathogenesis, pathology, endoscopic methods and obsolete or obsolescent antiseptics. He has stripped the management of gonococcal infections of all unnecessary accessories and has streamlined his treatment. Infections refractory to one sulfonamide were retreated with the same or a kindred drug or by fever therapy or older conventional methods. The scope of the book covers treatment of men, women and children.

Uliron, Disulon and sulfamethylthiazole were early withdrawn from clinical investigation because of their toxicity. And "at present there is no place for sulfanilamide in the treatment of gonococcal infections." Sulfapyridine has a higher incidence of toxic reactions both general and within the urinary tract than have sulfathiazole and sulfadiazine and therefore there is seldom any indication for its use. Sulfacetamide, though less toxic than the former drugs, is inferior to sulfathiazole and sulfadiazine. Herrold has had more experience with sulfathiazole than with sulfadiazine and at present recommends it more highly. The author discusses the relative values of five and ten day treatments. He feels that the maximum safe total dosage without a rest period is 20 to 25 Gm. Chemical prophylaxis is discussed. Sulfonamide resistant cases are subjected to fever therapy. The subclinical infective state carrier is discussed as one of the potential hazards. The author recommends a minimum period of three months' observation and repeated negative cultures as proof of cure. Chemotherapy has definitely decreased complications. The problem of diagnosis and determination of cure is exceedingly more difficult in the female because symptomless infections are more frequent. Epidemiology, prophylaxis, culture mediums and their method of transportation are considered. Sixty-two case histories are excellently presented. This book should be read by every one treating gonorrhea.

Diseases of the Liver, Gallbladder and Bile Ducts By S. S. Litchman, M.D. F.A.C.P. Assistant in Postgraduate Medical Instruction, University Extension, Columbia University, New York. Cloth Price \$11. Pp. 906 with 122 illustrations. Philadelphia: Lea & Febiger, 1942.

The author has done a good job of compilation of physiologic and clinical data. The book is especially valuable for reference because of the extensive bibliography for every chapter. One might take exception to several controversial statements on page 73. The lactic acid cycle is stressed as important while it comes into play only in certain phases of severe exercise when lactic acid is formed by muscle as the result of relative anoxemia. On the same page the author makes the statement that glycogen is converted by amylase. There is no amylase present in the normal liver cells. His discussion of liver function is well done. However in future editions he should correct the statement. Normally the plasma cholesterol is 45 to 75 per cent esterified. The work of Sperry and Schonheimer has shown normal esterification to be between 68 and 72 per cent. For the most part the physician will find the book useful for ready reference. The best sections are the histology, pathology and liver function tests and then the clinical sections.

The Sexual Cycle in Women: The Relation Between Ovarian Function and Psychodynamic Processes By Therese Benedek, M.D. and Boris B. Rubenstein, M.D. Ph.D. Psychosomatic Medicine Monographs Volume III Nos. I and II. Published with the sponsorship of the Committee on Problems of Neurotic Behavior, Division of Anthropology and Psychology, National Research Council, Washington, D.C. Paper Price \$3.50. Pp. 307. Washington, D.C.: National Research Council, 1942.

Observations in psychosomatic medicine formerly consisted of case reports in which an effort was made to show a relationship between symptom formation and life situation. In recent years the attempt has been made to investigate the possibility of a specific relationship between the illness and the personality of the patient. In this category are studies which attempt to define the psychologic characteristics of patients who are apt to fall ill with such medical disorders as asthma, peptic ulcer and hypertension.

The present monograph is one of a series designed to meet the needs in this field of publication for experimental data resulting from longer studies than can be published in the *Journal of Psychosomatic Medicine*. A research project of the Institute for Psychoanalysis, Chicago, the investigation represents a new and important departure in psychosomatic medicine. It combines histologic and psychologic methods in an effort to see whether a correlation exists between endocrine function and psychodynamic processes. The investigators, working independently, studied the vaginal smear and basal body temperature and made psychoanalytic observations of the emotional life on fifteen women of childbearing age. The findings were then compared. One hundred and fifty-two menstrual cycles were observed, embracing 2,261 days of observation.

As a result of the investigation the authors find that the sexual cycle is a psychosomatic unit. Psychologic material dominated by heterosexual interest (centritugal psychodynamic tendencies) are related to estrogen production while the psychologic material corresponding to the progesterone phase of the cycle shows passive and receptive features (centripetal psychodynamic tendencies). Desire for impregnation, the tendency to care for a child and the various reactions to these tendencies are reflected in the psychologic material. The pregnancy wish is one of the most characteristic psychodynamic expressions of progesterone function. Correct predictions of gonad hormone production based on psychoanalytic observations, were made in 2128 of the 2261 days of observation. Adequate tables present the correlation.

A chapter is devoted to a critical evaluation of both methods, the vaginal smear technic and psychoanalysis, as instruments of biologic research. The authors feel that the vaginal smear, basal body temperature technic affords a method for day by day investigation of the gonadal cycle and that psychoanalysis permits investigation of the day by day fluctuations in psychosexual tension. They demonstrate the exactness with which the psychic apparatus reacts to changes of gonad hormone production. In fact the psychologic changes appear to precede the vaginal smear changes, in other words, the psychic apparatus reacts first and the histologic changes of the vaginal mucosa develop later. Whether the patient whose sexual inhibition disappears as a result of psychologic treatment will produce more gonad hormones than previously cannot be answered at present. This as well as the investigation of additional symptoms are problems that must remain for this new psychosomatic technic. Concerning the even more intriguing problem of whether this kind of an investigation can be used for the purpose of combining endocrine therapy with psychoanalysis, the authors properly caution as follows:

We studied only how the individual reacts to her own hormones. It is not improbable that microscopic study of psychodynamic reactions to hormones might clarify indications for hormone therapy. But it is evident that the psychosomatic reactions to hormones are so complex that we should caution against medication with hormones rather than encourage it. There must be precise indication which necessarily includes an understanding of the psychodynamic reactions of the patient to her own hormones.

This investigation is the first in which daily material obtained by psychoanalytic technic is correlated with the result of endocrinologic assays. The authors are to be congratulated for the careful coordination of two methods which despite the differences in their fields of observation has provided a new tool for biologic research. The monograph is a milestone in the rapidly developing field of psychosomatic medicine.

Helbrigðisskýrslur (Public Health in Iceland) 1939 Samdar af Landlækni offr skýrslum heilbrigðisna ok odrum heilbrigðis. With an English summary. Paper. Pp. 196. Reykjavik. Hildisprentsmiðjan. Copenhagen, 1941.

This report of public health conditions in Iceland for 1939 is a government publication prepared by the Ministry of Public Health. It is a well organized and comprehensive record of public health activities and statistics for the year, being modeled in format after the records of Denmark and Norway. The statistical tabulation and analysis of births, deaths and morbidity seem to be good, and the tables showing the distribution of diseases, causes of death, births and deaths by province have English or Latin headings so that they are easily analyzed by one with knowledge only of the English language. There also is a summary in English containing a table of the common communicable diseases for the period 1930-1939 inclusive together with short paragraphs discussing the various diseases, school inspections, care of infants, general insurance, food and nutrition, hospitals and immunization programs. Comparison of the birth, death and infant mortality rates with those of the United States for the same period is of great interest.

Birth, Death and Infant Mortality Rates, Iceland and the United States 1939*

	Iceland	United States
Births (per 1,000 of population)	19.1	17.3
Infant deaths (per 1,000 live births)	37.3	28.0
Deaths (all cause) (per 1,000 of population)	9.7	10.6

* U. S. Bureau of the Census.

*Death Rates per Hundred Thousand of Population for Selected Causes, Iceland and the United States**

	Iceland	United States
Cancer	140.5	117.5
Pneumonia and influenza	131.0	75.7
Diseases of the heart	104.3	275.5
Tuberculosis	51.0	47.1
Accidents	47.4	70.4
Old age	147.4	7.3

* U. S. Bureau of the Census.

The consistently high rates for the acute respiratory diseases are to be expected. This group includes, in addition to the acute upper respiratory diseases "acute respiratory catarrh," bronchial pneumonia, lobar pneumonia and influenza. For the ten year period noted the morbidity rates for "acute intestinal catarrh" varying between 13.18 and 26.09 per thousand bear special note.

Among Iceland's greatest public health problems is tuberculosis. From 21 to 35 cases of leprosy were reported yearly for the period noted and 6 to 12 cases of hydatid disease with 3 to 11 deaths annually. The book is bound with paper, and the printing on good quality paper is excellent.

Autonomic Regulations. Their Significance for Physiology, Psychology and Neuropsychiatry. By Ernst Gellhorn, M.D., Ph.D. Professor of Physiology, College of Medicine, University of Illinois (Chicago). Cloth. Price \$5.50. Pp. 373, with 51 illustrations. New York: Interscience Publishers, Inc., 1943.

The subject matter is divided into five main parts: introduction—atomic and physiologic foundation, adjustment reactions involving primarily the respiratory and circulatory system, autonomic-endocrine integration, autonomic-somatic integration and results and applications, physiologic and clinical. The discussion is based largely on work done in the author's own laboratory during the past six years. His chief interest is in the various organ reactions leading to a net result in the whole organism rather than in the physical and chemical basis of activity in any single organ. He tries to show that the autonomic nervous system is not only an efferent system carrying impulses from the somatic system to various visceral organs but also an afferent system whose impulses significantly alter the excitability of the somatic system. His studies also lead

him to a reconsideration of the validity of the principle of reciprocal innervation as applied to the sympathetico-adrenal and the vagosympathetic systems. An attempt is made to utilize these studies for the problems of neuropsychiatry. This volume is too highly specialized to be of interest to physicians in general. However, the bibliography of eleven hundred references and the subject and author indexes make it a valuable reference book, of particular use to physiologists and clinical specialists.

Acute Infections of the Mediastinum. By Harold Neuhauf, M.D., D.S., F.A.C.S., Clinical Professor of Surgery, Columbia University, New York, and Edward F. Jernigan, M.D., D.S., F.A.C.S., Associate Attending Surgeon, Sydenham Hospital, New York. Cloth. Price \$6. Pp. 307, with 157 illustrations. Baltimore: Williams & Wilkins Company, 1943.

The basis of this treatise is the experience gained with 100 cases of acute mediastinitis. These are divided into four groups: (1) mediastinitis secondary to esophageal trauma (of special importance is the fact that mediastinitis may result from instrumentation of the esophagus with nonpenetrating trauma of this passage); (2) those secondary to upper respiratory infections; (3) those secondary to pulmonary or pleural infections and (4) those of miscellaneous causation. The case presentations are rendered quite vivid by the publication of roentgenograms and accompanying line diagrams to emphasize the important features. There is a well written section on the surgical anatomy of the mediastinum, and the pathology and bacteriology of mediastinitis. The general clinical aspects are discussed in a separate section apart from the detailed case reports, with emphasis placed on roentgenologic diagnosis. Treatment is discussed in detail in the final section. The importance of correct surgical management is emphasized by the tables showing the comparative mortality among patients operated on and not operated on. Scant mention is made of the use of sulfonamides, but this undoubtedly is due to the fact that a large percentage of the patients were treated before the advent of these drugs. In the concluding remarks the authors state that "the chief purpose of this contribution is to call attention to the necessity of recognizing situations in which invasion of the mediastinum is likely to occur to the end that appropriate surgical measures are instituted which will prevent mediastinitis." The average practitioner or surgeon has limited experience and knowledge of the subject dealt with in this monograph. For this reason it constitutes an important contribution and should be in hospital libraries as a reference book. Needless to add, it should be available to all those specializing in diseases of the chest. Furthermore it will be of great value to those in military service, who will be faced with the problems of mediastinitis among casualties presenting wounds of the thorax or of those adjacent regions from which infection of the mediastinum may occur.

Flying Men and Medicine. The Effects of Flying upon the Human Body. By E. Osmun Barr, M.D. Cloth. Price \$2.50. Pp. 234, with 7 illustrations. New York & London: Funk & Wagnalls Company, 1943.

The author, a flight surgeon in the last war, attempts to give a readable presentation of problems of physiology and hygiene encountered by flying personnel. The book is divided into two parts, the first dealing with the nervous system and special senses, the second with other bodily systems including respiration, circulation and digestion. The language and presentation is elementary in the extreme, being pitched at the grade school rather than the high school or college level. Granted that basic training for flying personnel might advantageously begin with the 16 and 17 year olds, the present book will probably fall into the hands of men in their 20's. It is too elementary to be of real service and it can only suffer by comparison with other recent books in the same field, such as Grow and Armstrong's *Fit to Fly* and Gemmell's *Physiology in Aviation*.

Sorderas sifiliticas. Ensayo de Interpretación audiométrica. Por el Dr. David Teffenberg. Paper. Pp. 258, with illustrations. Buenos Aires, 1942.

The author, impressed by the large number of patients complaining of deafness showing positive serologic reactions despite absence of syphilitic antecedents, has selected 100 of them and has carried out a thorough clinical and serologic study. The variety of specific conditions studied precludes summarizing the conclusions reached, and the specialist will have to find them in the original thesis.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

EFFECTS OF ULTRAVIOLET IRRADIATION ON SCHOOL CHILDREN

To the Editor—I seek an opinion as to the therapeutic value to be had by exposing the naked bodies of school pupils, who are found on examination to be undernourished, to ultraviolet rays. At this special school for the malnourished pupils it is the practice to afford such lamp (Hanovia) treatment to pupils for a period each day. While it is not a residential school the pupils are furnished a warm light form of nourishment on arrival and a full meal at noon. Pupils are also afforded a rest period on cots, medical and nursing supervision and menus prepared by a nutritionist. The pupil time necessary for all that is furnished for improvement of health is looked on with jealousy by those who have the responsibility for instruction in the traditional elementary subjects so that they are asking for a cut in that now used for developing health which was the prime object of this special school. Education of those physically handicapped is our responsibility. Naturally I wish to cooperate but hesitate to advise discontinuance of the lamp treatment without more information.

George J. Holmes, M.D., Newark, N. J.

ANSWER—The most important and the most thoroughly demonstrated effects of ultraviolet irradiation of the exposed body are those relating to the phosphorus and calcium metabolism. Rickets and tetany in infancy and early childhood and the vitamin D deficiency type of osteoporosis in older children and adults can be prevented from developing or can be cured if already present by ultraviolet irradiation of the skin. Since vitamin D administration also has these particular effects it may be substituted for the light treatment.

Many claims and counterclaims have been made regarding the less specific effects of this form of irradiation on general nutrition. Exact experimental data on this aspect of the problem are almost entirely lacking although many conservative pediatricians and physical therapists believe from empirical experience that recovery from mild subacute pyogenic infections, nutritional anemia and slow or stationary weight gain is accelerated by ultraviolet treatments twice or thrice weekly. Final proof of its value in the treatment or prevention of these conditions is still wanting.

The third use of ultraviolet irradiation among children grouped together in homes, hospitals or school rooms is that of sterilizing the air. Proof that irradiation of the air by ultraviolet lamps tends to reduce the spread of certain infectious diseases has been furnished by carefully conducted experiments in several cities.

EXPOSURE TO GASES IN MUNITIONS PLANT

To the Editor—I should like an opinion on the damage that might occur from the inhalation of gases in a munitions plant. The various gases to which these workers are exposed are nitrous oxide, nitrous acid, phenol, ammonia, sulfuric acid and ammonium picrate. I am particularly interested in the effects of these gases first on the apparently normal individual and second on the individual having arrested or cured tuberculosis. Do you think that exposure to these gases might render a person exposed to them more susceptible to tuberculosis or cause a reactivation of the disease?

J. D. Riley, M.D., State Sanatorium, Ark.

ANSWER—In general, munition plant gases may cause irritation especially of the respiratory tract, the eyes and to some degree of the skin. Then following absorption the agents will produce various forms and degrees of systemic poisoning. The most important of all the gases mentioned and probably the chief ones to be considered if poisoning of munition workers is being produced are of course the nitrous fumes. The symptoms and method of control of these were discussed at the conference on nitrous fumes on Jan. 28, 1943 at Cincinnati. The results of the conferences are summarized in the *Industrial Hygiene U. S. Public Health Service* 36 (Feb.) 1943. In addition other data on the subject are available in the article by A. J. Fleming (*Indust. Med.* 12:131 [March] 1943). Phenol fumes in addition to their well known local irritations may cause systemic reactions in the form of lassitude, dizziness, headache, yellow skin and albuminuria. Ammonia of course, would have its first effect on the eyes and upper respiratory tract. The chronic form of poisoning would chiefly be of the catarrhal type. Sulfuric acid fumes would also affect the respiratory tract. Ammonium picrate would chiefly cause eczematous dermatitis of the skin but the fumes of this compound may dissociate into ammonia and picric acid and produce the characteristic reactions of each. Picric

acid causes discoloration of the hair, skin and hands and various types of gastritis. The general recommendation of the Cincinnati conference on nitrous fumes with regard to the prevention of pulmonary irritation and systemic poisoning could be followed for all these other agents. It has been demonstrated that pulmonary irritation especially as concerns the pulmonary irritants of chemical warfare does not predispose to the development of pulmonary tuberculosis. However, people with pulmonary tuberculosis should not work with any of the pulmonary irritants since aggravation of the tuberculosis may be produced. In most instances whenever possible it is preferred not to use people with a history of pulmonary tuberculosis healed, arrested or active lesions. The careful preplacement examination with its x-ray study will be of great help in determining the advisability of employing such a person.

PROBABLE PELVIC HEMATOMA AFTER CHILDBIRTH

To the Editor—A primipara aged 20 had an uneventful labor, delivering spontaneously a living male child weighing 7 pounds 11½ ounces (3,500 Gm.) cephalic presentation left occipitoanterior position with a moderately deep right mediolateral episiotomy which healed by first intention. The pelvic measurements are within normal limits. Early in pregnancy a glycosuria was discovered and the fasting blood sugar was 180 mg. per hundred cubic centimeters. (Her mother died of diabetes and diphtheria.) The elevated blood sugar was controlled by diet and insulin. At present she is taking 10 units daily of protamine zinc insulin and her fasting blood sugar is 100 mg. per hundred cubic centimeters. Otherwise her pregnancy was uncomplicated and the puerperium was uneventful. At the six weeks postpartum pelvic examination a tumor mass about 3 inches in diameter was found in the left side of the pelvis immediately within the vaginal introitus. This mass is bounded medially by the vagina and posteriorly by the rectum and it is attached to the descending ramus of the pubis, the spine of the ischium and contiguous ligamentous structures. Its superior border lies about 1 inch above the level of the ischial spine and ½ inch posterior to the pubic symphysis. Its inferior border is at the tuberosity of the ischium. On the superior and anterior aspects of the mass are two nodules firm and about ½ by ¼ inch in diameter. They seem to be closely attached to the mass. The mass itself is firm but fluctuant. The vaginal mucous membrane and the rectal wall are not attached to the mass, as determined by rectovaginal examination. The former and the vestibular glands appear normal. The uterus is freely movable. The left ovary could not be palpated, but other pelvic organs were normal and there was no unusual discharge. There is no history of venereal disease. Plain roentgenograms taken separately for soft and bony tissue fail to outline the tumor and there are no striations and no moth eaten appearance suggesting malignancy or densities associated with a dermoid. The blood Kahn reaction was reported negative. The red and white blood cell counts are within normal limits and the urinalysis is negative. The patient does not complain of symptoms and she was unaware of the presence of the mass. On second examination two weeks later the tumor was perhaps slightly smaller but was still firm and fluctuant and not tender. It does not seem that the mass could have been its present size at delivery as it now reaches the sagittal plane of the pelvic outlet. Please suggest differential diagnosis and any other lines of study and recommend treatment.

M. D. Washington

ANSWER—The mass described is most likely a hematoma which developed at the time of delivery as a result of the rupture of some blood vessel, probably a vein. Such hematomas can occur in the absence of major trauma. The patient should be observed periodically and the mass should slowly decrease in size, ultimately completely disappearing with residual induration.

The location of the mass described is not typical for a cyst that is the result of some embryologic vestige. Ovarian neoplasms are usually movable unless they are intraligamentous. A neoplasm of the ovary or uterus would probably have been recognized during pregnancy or delivery.

STENOSED URETHRAL MEATUS IN YOUNG BOY

To the Editor—I should like to inquire about the treatment of urethritis in a boy aged 2. Smears are negative for gonococci and there is no history of infection in the parents or those who have cared for the boy. The infection is of two weeks duration and is not responsive to sitz baths, 5 per cent sulfathiazole ointment and sulfadiazine orally. The infection is restricted to the area about the glans penis and the terminal urethra. The boy is unable to urinate because of crusting over the meatus. He can urinate after a bath. Only pus cells appear on the smear. The Wassermann reaction is negative. Kindly discuss and suggest treatment.

M. D. Kansas

ANSWER—The condition described almost certainly indicates the presence of a stenosed urethral meatus. While it may appear to be of normal caliber from the surface it almost always under the condition described produces retention of the secretions which make for local non-penic urethritis with secondary encrustations and obstruction to urination.

The treatment is meotomy followed by local antiseptics. Perhaps urinary antiseptics by mouth should be employed also. This assumes that there is no gonorrhea or phallor- or characroidal infection.

SENSITIVITY TO MILK AND CHEESE—BUTTER AND OLEOMARGARINE

To the Editor—Will you tell me whether in the making of cheese the lactalbumin of milk is broken down enough so that patients who tolerate boiled or evaporated milk may also use cheese? At the present time is butter likely to be adulterated with vegetable fat when bought by the pound or is it only in restaurants that one might find this?

M D, Illinois

ANSWER—In the making of many varieties of cheese lactalbumin is either removed to a large extent in the processing or it appears to become denatured. Many persons who are sensitive to milk are able to tolerate cheese without difficulty. There are so many factors involved, however, that a therapeutic test is indicated.

In regard to adulteration of butter it is hardly likely that this would be done because the offense is easily detected and punishable by rather severe fines under both federal and state laws. It is the opinion of nutrition experts that oleomargarine can be substituted for butter in the usual diet without detriment, provided the oleomargarine has been suitably fortified with vitamins. In accordance with regulations of the Food and Drug Administration which require a minimum of 9000 U. S. P. units of vitamin A to the pound. Of course under wartime conditions of scarcity there is apt to be substitution of colored oleomargarine for the white with intent to deceive by unprincipled persons but this is definitely in conflict with the law.

HYPEROPIA AND SPASTICITY OF CILIARY MUSCLE

To the Editor—A patient aged 32 complains of pain in the eyes and headache particularly after close work. Visual acuity is 20/15 in the right eye and 20/15 minus 2 in the left eye. With the bichrome test the patient sees the letters better on the red side with each eye and requires a minus 0.5 correction to make the letters on the two sides appear equally distinct. Manifest refraction shows that the patient accepts minus 0.5 in both eyes with a correction to 20/15 in both eyes and the bichrome check equal. Retina copy shows that the patient requires minus 1.2 diopter in each eye but on static refraction the patient accepts plus 0.25 in each eye with a visual acuity of 20/15 and bichrome check equal. This is a problem which I have encountered many times. Is it common for a patient with a low myopia to accept a plus lens under mydriasis with homotropine? What is the proper treatment in such cases?

M D, West Virginia

ANSWER—The inquirer states that the patient has a low myopia but that under homotropine mydriasis it is a low hyperopia. It is a common phrase for a young person with a low degree of hyperopia to have a spastic condition of the ciliary muscle with the result that the manifest refraction indicates a low degree of myopia. This very spasm of the ciliary muscle is responsible for the pain in the eye and the headache that accompanies close use. The spasm of the ciliary muscle will be increased by the use of a myopic correcting glass, but it can be relieved either by the continuous use of the glass that is properly fitted under homotropine or by the use of a mydriatic for a period of several days to a week.

LATERAL NYSTAGMUS

To the Editor—Aside from congenital nystagmus, can a lateral nystagmus exist in apparently normal persons on extreme lateral gaze? Can a weakness of extraocular muscles give an illusion of a nystagmus and yet not be a true nystagmus? I have in mind a case wherein a neurologist claims nystagmus exists and a competent ophthalmologist says it does not.

M D, New York

ANSWER—Yes, lateral nystagmus can occur in some normal persons on extreme lateral gaze. This is known as pseudonystagmus. This type consists in transitory, irregular jerky ocular movements. In weakness of extraocular muscles due to alcoholic polyneuritis, myasthenia gravis, gumme intoxications, nicotine poisoning and lead poisoning one may find nystagmus. This is a true nystagmus and is not an illusion. In ocular defects nystagmus occurs and consists in an inability to fix the gaze on an object.

BLOOD TESTS ON BLOOD DONORS

To the Editor—Can you inform me what blood tests are done on blood specimens taken from donors by the American Red Cross? I am particularly anxious to know what test is done to diagnose incipient tuberculosis or other tuberculosis by a blood test.

H H Holland, M D, Red Lion, Pa

ANSWER—The only blood tests done by the Red Cross at the present time are the hemoglobin determination and the Wassermann test. No attempt is made to diagnose tuberculosis by a blood test, the presence of this and other infections being excluded by the history and physical examination.

ESOPHAGEAL DIVERTICULUM

To the Editor—Recently there has come under my observation a man aged 50 who gives a typical history of an esophageal diverticulum, with symptoms of this having been present for at least the past five years. Examination of the lower pharynx with the laryngeal mirror reveals an internal opening which is visible just below the base of the epiglottis and to the left. X-ray films made following the ingestion of barium sulfate present a picture typical of an esophageal diverticulum with a capacity of at least 4 or 5 ounces and extending down to the level of the angle of Louis. The question arises, because of the high position of the internal opening, as to whether this might be related to the branchial cleft. I should like to know something of the incidence of this sort of diverticulum and where I might find suitable literature concerning it.

Robert B Morrison, M D, Colorado Springs, Colo

ANSWER—The case presented is that of a typical Zenker's diverticulum, and it is usually situated above the upper sphincter of the esophagus. These are amenable to surgical procedures in the hands of a good surgeon, and the physician is referred to diverticula of the esophagus, page 437, chapter by Porter P Vincent, M D, in Diseases of the Digestive System, edited by Sidney A Portis (Philadelphia, Lea & Febiger, 1941).

MUSCLE PAIN ASSOCIATED WITH THYROID ADMINISTRATION

To the Editor—Can you offer an explanation for the excruciating, twisting muscle pains which sometimes appear when a patient who has been taking thyroid discontinues the preparation and which disappear when the preparation is resumed? It is my impression that the patient in question has had some intoxication with thyroid, perhaps over a period of many years.

Louis J Bailey M D, Detroit

ANSWER—In a large experience with hypothyroidism, muscle pain of this type has never been seen to develop when thyroid administration is omitted but has been seen when thyroid is first given in a fairly large dose to a myxedematous person. Following the intravenous administration of 10 mg of thyroxine to such a patient all the muscles may be so tender that the patient is unable to sleep and this muscle tenderness may be associated with a rise in temperature to as high a level as 104 F. There may be nausea and vomiting. The muscle pain lasts from two to three weeks and then disappears completely in spite of continuing thyroid. The pain is probably related to the sudden changes which occur in the chemistry of the muscle.

DENTAL NEURALGIA

To the Editor—A married woman aged 47 had the roots of the left upper incisors and canine teeth removed in September 1942. Since then she has been complaining of a pulling sensation over the left cheek, on the left eye and forehead, which has been annoying. There is slight tenderness just below and medial to the left infraorbital foramen. There are no other physical findings. X-ray examination of the upper jaws and sinuses is negative. Kindly discuss the diagnosis, treatment and probable duration of this condition.

Samuel Sunshine, M D, East Milton, Mass

ANSWER—This patient probably has a dental neuralgia due to disease in the gums of the left upper jaw. Despite the fact that roentgenograms of this region fail to show any abnormalities, there may be present in the gums another root that is exposed or there may be some caries. A competent dentist should examine this patient in detail looking for roots, caries and small openings. He should use a dental mirror. The treatment consists in removal of the foreign substance, treatment of the caries or finally laceration of the gums. This case does not appear to be a trigeminal neuralgia but a dental neuralgia. The pain should disappear when the cause is removed.

EXERCISE AFTER CARDIAC INFARCTION

To the Editor—I read with great interest from page 1350 of the Dec 19 1942 issue of The Journal an answer dealing with the question of exercise after complete healing of mild cardiac infarction. There I read "Exercise is probably desirable in the effort to maintain a good general state of health as well as to help to control obesity and to prevent a sluggish peripheral circulation." As one of those physical educators who sees value in exercise, I am of course overjoyed at this recognition of exercise in the management of recovered heart cases. But in spite of my pleasure I do not agree entirely with the enthusiastic answer of this query. It is hard to imagine the person with mild cardiac infarct who is able to do enough exercise to control obesity. Thus for example, in order to work off 1 pound of body fat one would have to walk 144 miles at the rate of 1 mile in thirty minutes, one would have to fence for eight hours or do parallel bar work for seven and one half hours. I could not recommend such doses for patients with heart disease. It would be too much of an overload even in the judgment of an exercise physiologist.

THE PLANNING OF MEDICAL SERVICE FOR PRESENT NEEDS AND FUTURE REQUIREMENTS

PRESIDENT'S ADDRESS

JAMES E. PAULLIN, MD
ATLANTA, GA

Those of us whose privilege it was to serve our country during the first world war and to observe in the past few years the gradual destruction of principles for which we fought now face a new world conflict. Those of us who have an opportunity now to participate in the defense of our nation must turn our attention to a study of medical needs during the present emergency and to planning for the postwar world. Such planning should consider the rehabilitation of mankind and the establishment of a permanent peace which will assure to every man, woman and child freedom of thought, freedom of action and liberty. Hate, despotism and tyranny should have no place in a postwar world dedicated to humanity. Medicine has a fundamental role and will assume an integral part in the establishment of enduring world peace. Without healthy minds and bodies, no nation of civilized men can survive or prosper.

The government of the United States was founded on certain principles which establish our present mode of living, thinking and acting. These principles were written into our Constitution by Thomas Jefferson, the anniversary of whose two hundredth birthday we recently celebrated. The dedication of a memorial to him, in the city of Washington, pays tribute to a great man who wrote "We hold these truths to be self-evident that all men are created equal, that they are endowed by their Creator with certain unalienable rights, among these are life, liberty and the pursuit of happiness." He also gave expression to a guiding principle, on which a sound program of medical planning is based, when he said "I have sworn upon the altar of God eternal hostility against every form of tyranny over the mind of man." The achievements of the medical profession in our country are an example of the wisdom of such freedom. By scientific progress in the control of infectious diseases including the almost complete eradication of a few diseases by prophylactic inoculations, prevention of accidents, establishment of adequate public health measures and development of better curative treatments, many years have been added to the span of life.

The present global war, with its far-flung battle fronts, has created many new and unexpected problems and has placed heavy demands on the medical resources

of our country. As the war progresses in duration and in intensity, these demands will be greatly multiplied. We must be prepared to meet medical problems as they arise, to supply the immediate needs and to formulate plans for effective service under changing conditions. In formulating such plans the American Medical Association is not an isolated unit. For the greatest good the combined and cooperative efforts of all organizations interested in medical care must be enlisted as participants in the program. The American Medical Association, the American College of Surgeons, the American College of Physicians, the American Dental Association, the American Nurses Association, the Association of American Medical Colleges, the United States Public Health Service, the Medical Corps of the Army and Navy, the Procurement and Assignment Service are vitally interested in the perfection of plans which will furnish better and more evenly distributed medical service for our people. I know of no time in the history of American medicine when such an undertaking could be more effectively or usefully initiated than now.

MEDICAL EDUCATION

The maintenance of an acceptable program of medical education is an essential part of the war effort. To meet present military and civilian needs, the Council on Medical Education and Hospitals of the American Medical Association and the Association of American Medical Colleges have endorsed a continuous program of medical education and training in most of the medical colleges of the United States. With this acceleration of the educational program a medical student completes a four-year course of study in three calendar years. The establishment of this program has thrown an additional burden on already depleted faculties of medicine. Much less time can be given to investigative work which is an important contribution of these institutions to the advancement of medical teaching and knowledge.

The lowering of the draft age to 18 years and the establishment of Specialized Collegiate Training Programs by the Army and Navy for premedical and medical students place further responsibilities on the members of faculties of medicine. The selection and assignment of students to various courses and institutions, together with the interruption of study by the fulfillment of a thirteen-week military training program for those in the Army, still further complicate a difficult situation.

Provision has not been made for the education and training of doctors for civilian practice. Approximately 20 per cent of the facilities of each medical school can be utilized for the training of women and men physically disqualified for military duty and a few deferred by Selective Service. From these sources, civilian and other nongovernmental needs must be met. With the

graduation of approximately 6000 students each nine months, it is estimated that 1200 can be used as replacements for civilian needs. This will be increased by five or six hundred physicians who are being retired from the military services each year. Most physicians who serve civilian needs are over 45 years of age, consequently the expected mortality will be high amounting to 2500 or more each year. Plans should be formulated now for the better utilization of this group when the necessity arises.

SUPPLYING CIVILIAN NEEDS

The rapid expansion of essential war industries has necessitated an unpredictable and unexpected increase in the resident population about many of these plants. With such a rapid increase in population unusual demands have been made for housing, sanitation and medical care. In some localities these needs could not be immediately supplied, thus causing acute distress. To formulate plans and recommendations for the handling of such emergencies, the War Participation Committee of the American Medical Association in conference with the United States Public Health Service and the Procurement and Assignment Service, agreed on certain methods of procedure which could be utilized to meet these emergencies. These recommendations have been published in *The Journal of the American Medical Association* and were sent to the department of public health in every state and to every state chairman of the Procurement and Assignment Service.

Much has been said of the importance of redistribution of physicians throughout the United States; indeed, some have urged the creation of a governmental agency to supply medical care to all who require it. When the medical needs of a community cannot be met at a local or state level, the state medical society may request the central office of the Procurement and Assignment Service, with the help of the United States Public Health Service, to supply the need by relocating physicians. An attempt is first made to relocate physicians within the state for such service; when this is not possible, they are obtained from other states. For the period ended March 31, 1943, thirty-three states reported to the Procurement and Assignment Agency 692 relocations. During 1942 and for the first quarter of 1943 a total of 866 doctors were relocated, not all of these by the Procurement and Assignment Service. Just now, according to the best information available, there is need for approximately 300 additional physicians to supply medical needs in 198 areas. The United States Public Health Service has been most cooperative in helping to supply urgent needs in those communities in which the local and state medical societies and the Procurement and Assignment Service were unable to give immediate assistance. The Public Health Service assumes this responsibility as an emergency measure, and physicians so assigned are under the direction of the state department of public health. By this procedure areas which required medical service have been supplied with physicians sufficient to meet their needs. This has been accomplished, furthermore, without gross violation of the rights of the individual states to regulate medical practice, of the rights of physicians who have entered military service to retain the practices that they have developed over the years, and of the rights of the patients to receive the medical care that they required.

MILITARY PERSONNEL

The American Medical Association has a continuing interest in every physician who has joined the military forces. Our obligation to keep physicians informed concerning matters of military importance is the publication in each issue of *The Journal*, under the special heading "Medicine and the War," of the activities of various agencies in national defense. Scientific achievements as related to war, are published in *THE JOURNAL* as well as in *War Medicine*.

In view of the emergency, all large medical meetings have been postponed for the duration of the war. Previously medical meetings served to supply short post-graduate courses for many members. The discontinuance of these meetings created a new obligation for organized medicine. With the approval of the Surgeon General of the Army, the Navy and the United States Public Health Service, the American Medical Association in cooperation with the American College of Surgeons and the American College of Physicians, is now offering a series of "Wartime Graduate Medical Meetings" to all service hospitals of the Army and Navy over the entire United States. The committee in charge of this program has the help of a large group of consultants in special medical fields as well as the aid of most medical schools. The organization of a faculty for graduate medical training contemplates making available to military organizations various types of medical instruction conducted in the form of lectures, clinics, round table discussions and ward rounds. The program consists of thirty or more different subjects, from which each organization may choose six or eight for presentation by experts. Thus medical leadership again proves itself alert to the needs of the hour.

THE PROCUREMENT AND ASSIGNMENT SERVICE

Before the declaration of war, the Committee on Medical Preparedness of the American Medical Association had prepared a roster of all physicians of the United States with detailed information relative to their training, their professional qualifications and their scientific achievements, and a statement as to their availability for military service. With the establishment in October 1941, by executive order of the President of the United States of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians, the accumulated data of the Committee on Medical Preparedness became available for the beginning of this work. Shortly after the establishment of this service and before either an adequate secretarial staff or permanent quarters could be obtained, and before members of the board could become fully acquainted with the problems involved, war was declared. With the declaration of war there was a request from the Surgeon General of the Army for the recruitment of a large number of physicians for duty with the medical corps. To supply this demand the only available data were those furnished by the Committee on Medical Preparedness. During the active stage of supplying this need it soon became evident that the voluntary enlistment of physicians would deprive many communities of essential medical service. A committee on the Allocation of Personnel was created to determine the distribution and effectiveness of the available physicians and dentists in each state and to establish a measure whereby the medical and dental needs of each state could be equally and fairly adjusted. With the aid of the United States

Public Health Service, statistical data were accumulated and after many conferences a quota of one physician to fifteen hundred persons was established.

As a result of these investigations it soon became evident that many states had surpassed their quotas of physicians and dentists, while other states were far behind their allotment. When war was declared 13,000 physicians were on duty with the Army and Navy. During 1942 this was increased to approximately 42,000, the requirements had been met. During 1943 approximately 11,000 additional physicians will be required representing about all that can safely be spared from civil practice. According to the quota system previously established this number must be drawn from thirty-four states. There are only fifteen states which must yet supply more than 100 physicians each. This does not mean that recruitment will be discontinued from states without quotas for 1943. Certain large cities in these states have a physician-population ratio greater than the standard accepted. These cities will be called on either to furnish physicians for communities within that state which are in need of doctors or to declare their younger men available for military duty.

The recruitment program is being pushed now in some five or six states that are a little backward about supplying their proportion of physicians. While the enlistments just now are behind schedule, I am convinced that we still have enough available patriotic physicians to supply the needs of our armed forces on a voluntary enlistment program. Physicians have never failed to respond in an emergency and they will *not fail now*.

The Procurement and Assignment Service is the only federal agency directly concerned in maintaining a sufficient number of physicians in civil practice to maintain medical education at its present level, to supply the medical needs of industry and to furnish medical care for the civilian population. Medicine is honored in being the only group in our population with such a responsibility assigned to its own members. This activity has been possible only through the cooperation of local and state chairmen of the Procurement and Assignment Service with the directing board. The seriousness and earnestness with which these men have performed their duties is a source of gratification. The criticism aimed at the Procurement and Assignment Service for alleged mistakes or deficiencies has usually emanated from sources ignorant of its accomplishments or seeking to promote disruption in medical affairs. Such criticisms have in most instances been made without any investigation of the truth or falsity of the claims. As a member of this board I feel that it has performed a creditable task; its accomplishments have been achieved through the voluntary effort of doctors and it will continue in the future as it has in the past to meet honestly and fearlessly the obligations placed on it by the President of the United States.

PLANNING FOR POSTWAR MEDICAL SERVICES

After the cessation of hostilities the American Medical Association with its 123,000 members faces the obligation of directing the intelligent planning and continuation of procedures which can be utilized in the rehabilitation of the health and medical needs of our people and through other agencies made available to the countries of our allies. Problems will arise in this country that will need serious consideration. No doubt

the greatest challenge to the medical profession that will come to us and to other agencies responsible for the readjustment that must take place after the war concerns the reabsorption into medical practice of doctors who will return from military service. During the past two years, through my connection with the American Medical Association, the American College of Physicians and the Procurement and Assignment Agency, it has been clearly shown that many communities, particularly those in rural districts, have suffered because of an uneven distribution of public health facilities, hospital beds and medical personnel. We should now be planning methods for overcoming these inequalities. Our present system for the education and training of medical students necessitates some provision which will enable them to go to rural communities and to practice there the type of medicine for which they have been trained. Arrangements may be developed whereby such communities can establish medical centers through which necessary hospital and laboratory facilities for the diagnosis and treatment of disease will be available for all civilian needs. The Beveridge plan and the report of the National Resources Planning Board indicate that the trend of medical practice inclines toward the establishment of the hospital and the medical center as the sources for distribution of medical care. The present emergency has accentuated the needs for such an arrangement. Even now in areas of great distress the local profession in cooperation with the United States Public Health Service and other federal agencies, can arrange for the establishment of such facilities for the use of these communities.

It will be an obligation of the medical profession to provide for the physicians who return from military duty an opportunity to have refresher courses or post-graduate training which will bring them up to date on the newer methods of diagnosis and treatment which have been developed during their military service. No doubt the government will recognize its obligation in making such provisions possible. The general practice of medicine will require more physicians than are now engaged in such service. The development of a community hospital service staffed with an adequate number of specialists capable of administering to the needs of a large number of people would make more physicians available to provide general medical service for the community.

The successful completion of such a program cannot be accomplished by the medical profession alone. Physicians, dentists, nurses, public health officials, hospital administrators and technicians, as well as governmental agencies interested in the health needs of a community, must cooperate in its development. Such a cooperative group can plan for the essential needs and for the proper distribution of medical care so that the greatest good can be achieved.

The maintenance of the high standards of medical education which now prevail reached through the continuous striving of medical leaders together with ample provision for medical research is fundamental to continued medical progress. Just now most research is concerned with problems directly related to national defense. The results of some of this can be utilized in civilian life such as the advancement in chemotherapy, the study of virus diseases and tropical medicine. The development of new drugs for the treatment of disease and particularly the results of research in aviation, are

only a few of these benefits. There is, and will be for the duration, a diminution in investigation concerning many diseases which are constantly with us, such as arteriosclerosis, heart disease, arthritis, cancer and mental disease. Facilities and personnel must be provided to institutions and laboratories for the resumption of studies on these and other unsolved problems directly affecting the health of our people. Stimulation to undertake such work must be furnished by the medical profession to many of those returning from military service war weary and exhausted. The time is not too soon for those who are far sighted to survey the field and to lay the lines of attack on these unsolved problems.

A committee on Postwar Medical Planning of the American Medical Association working in cooperation with similar committees from the American College of Surgeons, the American College of Physicians and other well recognized organizations should now begin to formulate plans whereby the facilities of all groups who occupy a vital part in the rendering of medical care can be more efficiently applied. When the war is over there can be offered to the people a carefully designed scheme for the medical rehabilitation of a war sick people. There are many agencies useful in preparing such a program which undoubtedly will help in an undertaking of this nature.

Admiral McIntire pointed out in a recent address that many physicians who are now members of the Medical Corps of the Army or Navy will continue in these services long after the war is over to meet the medical needs of peoples all over the world. Medical education in most of the Axis and Axis dominated countries has either ceased or progressed at an extremely low level during this war. Medical teaching in some of the countries of our Allies has been continued under serious military stresses. The medical profession of this country may be called on after the war to furnish teachers, instructors and practitioners to many countries to aid in the care of those stricken with disease. We must be prepared to meet the demand.

Poverty, hunger and disease know no bounds. Let us recognize our humanitarian obligation and duty, as representatives of a nation which possesses medical and other resources superior to those of any other nation in the world, to make our talents available in this emergency. Let us cooperate with all related organizations and governmental agencies interested in postwar rehabilitation to help in achieving the restoration of health and hope to a world suffering the devastating effects of a ruthless war. Such an undertaking is one of the essentials of an abiding peace. To this end the medical profession dedicates itself until the world shall again be progressing peacefully on the paths of human advancement.

The Origin of Superior Men—We may conclude therefore that the production of superior men is surely not an accident, that it has only a slight affiliation with income, that it is closely related to the kind of persons residing in New England and in the block formed by Colorado, Idaho, North Dakota, South Dakota, Utah and Wyoming from 1870 to 1900, and that these persons probably diverged from the average of the country toward the qualities which make persons in 1930 learn to read, graduate from high school, spend public funds on libraries rather than roads and sewers, own their homes, avoid homicide and be free from syphilis.—*The Origin of Superior Men, Scientific Monthly* 56 424 (May) 1943

THE PARAFFIN WAX OPEN AIR TREATMENT OF BURNS

LIEUTENANT COMMANDER RALPH C. PENDLETON
MC-V(S), USNR

The present global war has resulted in so many serious burns occurring *en masse* that surgeons face a challenge to devise some simple method of treatment which will be effective, humane and at the same time simple enough for application by inexperienced assistants to overworked doctors and nurses. In the emergencies of civilian and military bombings during the past few years, patients have necessarily been treated by many different doctors and by many types of treatment. Sufficient experience is now available to permit evaluation of various methods so that some uniformity of the best treatment can be established.

The following simplified technic that is presented has been employed successfully in private practice for

Fig. 1—Gauze mesh becomes enmeshed in the tiny proliferating epithelial cells. Each removal, even when wet, will delay healing and frequently increases scarring. Toxic materials are no menace when they are flushed off without trauma.

the past twenty-two years and is believed to be peculiarly suitable for present war conditions. A colored moving picture will demonstrate the technic that was used in a series of cases at the Mare Island Naval Hospital.¹ Of special interest to orthopedic surgeons is the absence of restricting gauze bandages, which encourages early free motion and prevents many contractures and deformities which have occurred in the past.

The treatment of any burn is naturally divided into general systemic care and local treatment and dressing. As far as general systemic care is concerned, the treatment of early shock has been fairly well standardized. Morphine for the relief of terror and pain is in common use. Plasma is still the best agent to maintain blood proteins, to supply liquids and to prevent and

¹ Technic and motion picture presented before the American Academy of Orthopedic Surgeons in Chicago Jan. 17, 1943.

diminish hemoconcentration. When at all possible and absence of nausea permits liquids by mouth are given generously and a high protein diet is used.

Late shock, which seems to be precipitated by that vague substance called burn toxemia, when accompanied by loss or destruction of blood, is most effectively controlled by whole blood transfusions.

There is also general accord in combating severe systemic infections which are dreaded complications of burns by the use of some sulfonamide compound internally. Our armed forces are using this method in the field prophylactically, as well as preventive inoculation for tetanus before combat service.

However the paraffin wax open air treatment, which is a local dressing varies from any other treatment in the following respects:

- 1 No cleansing or debridement is necessary before application of the wax.
- 2 No gauze or disposable tissue is incorporated in the wax.
- 3 Frequent shower baths form part of the treatment.
- 4 No dressing or covering other than the wax is employed, thus permitting early motion and constant observation.
- 5 One technic serves for burns on all parts of the body.
- 6 The same treatment is used for first aid and for definitive care.

Paraffin Wax Formula

Paraffin wax	670 Gm
Household wax	Melting point about 125 F. This softens the skin. For first aid ointment reduce to only 20 Gm rather than 670 Gm.
Petrolatum	250 Gm
Liquid petrolatum (heavy)	150 cc
Cod liver oil	50 cc.
Cottonseed oil or olive oil has been substituted satisfactorily.	
Sulfanilamide powder	50 Gm
Resorcinol 10 Gm in 15 cc of ethyl alcohol has been used as an effective antiseptic (before sulfanilamide).	
Menthol	1 Gm
Camphor	1 Gm
These relieve any itching or burning sensations.	
Oil of eucalyptus	1 cc
Used as a deodorant.	

Without cleansing or debridement of the fresh burn the paraffin wax formula is sprayed on all burned areas immediately sometimes preceded by frosting of the burned area with sulfanilamide powder.

The wax and petrolatum are melted on a water bath then the other materials are stirred in. While still melted pour the mixture into insecticide spray "guns" and allow to cool (melting point 117 F). The melting point may be adjusted for use in different climates by increasing or decreasing the amounts of petrolatum or wax. The mixture will keep indefinitely although it will turn brown if heated excessively. Reheat on a water bath and then spray it. Keep the mixture well agitated to keep the sulfanilamide in suspension.

The application of the wax spray stops pain and minimizes shock. In the wax are incorporated the soot, oil, dirt and broken skin, which all come off during the next few days. This produces a gentle delayed non-traumatizing cleansing.

However conventional debridement can be done before application of the wax if desired but many victims of burns from Pearl Harbor the South Pacific and the Boston fire who of necessity received no elaborate debridement showed splendid results. It is difficult to justify the rupturing of any bleb during the first few days since bleb contents are practically identical chemically with blood plasma. When conservation of

this plasma is desired, why should a clean closed wound be converted to an open one and thus more fluid loss be allowed?

Following the immediate treatment of a burn, the control of external or surface infections is the next important problem. The paraffin wax prevents the

Fig. 2—The wax spray is applied in a thin layer while the freshly showered area is still moist. The tiny globules of the wax spray adhere to the healing cells and push the water aside.

formation of sealing-in crusts, and since it cracks easily it provides excellent continuous drainage, a fundamental factor in the control of any infection. External infections usually become dangerous only if they are sealed in by crusts or leather-like eschars.

In minimizing contamination from without, the recent work by Dr. O. H. Robertson of Chicago shows the worth of propylene glycol as a germicidal vapor to

Fig. 3—A flash burn from a bomb destroyed full thickness of the skin over several areas. Function is maintained while the slough is separating.

sterilize the air in a room. Commander A. P. Krueger corroborates this work.

It is important to keep the floors and furniture clean. Moist sawdust is helpful in sweeping the floors. Protection of the fresh open wound against the organisms harbored by the nose and throat of attendants can be controlled by masking.

Because many of the bacteria come from the hair follicles and sweat glands, most burns are considered to be infected after twelve hours. Countless antiseptics, coagulants and tanning agents have been used in an attempt to sterilize the skin without destroying delicate

legs, or areas difficult to bandage such as the genitalia, eyes, ears and nares.

Many classifications of burns are given, but it is believed that the depth of corium involvement is more important than the surface area involved. It seems more rational to speak of only two classes of burns, namely whether there is full thickness destruction of skin or not. The undamaged sweat and sebaceous glands, together with the hair follicles, supply the tiny islands of epithelium from which the wounds heal when the full thickness of skin is not destroyed.

If these as well as all injured and healing cells are preserved throughout treatment, there will be better scars and quicker healing. Early motion and a pliable skin surface will minimize contractures and disfiguring adhesions. Most victims of burns with large areas of "full thickness" destruction of skin probably do not survive.

It is problematic whether any formula speeds healing. The first great advance that must be taken in any treatment of burns is to give the undamaged cells a chance to heal without interference of traumatizing, cleansing or tanning agents, chemical irritants or even fine gauze and frequent dressings. The paraffin wax in the formula is an effective substitute for gauze. Ordinary

Fig. 4.—Early passive motion prevents atrophy, fixed contractures.

tissue cells. Although this is desirable, it is practically impossible. However, when the paraffin wax spray is used the burn can be sprayed as often as necessary for the first few days and then once daily or oftener if necessary for comfort. The collected perspiration, exudate and toxic materials are flushed off by tap water in one of the three following ways depending of course on the patient's condition:

1. A flower spray or irrigating spray if the patient is confined to his bunk.
2. A hand bath spray while the patient is seated on a chair in a bathtub.
3. Under any ordinary shower if the patient is ambulatory.

Fig. 5.—Axillary contractures can be prevented by early motion. Frequent actual overhead traction is used. This patient had a severe flash burn. Five pounds extension was applied after four weeks. There was no contracture.

Tub baths are not permitted, as contamination of relatively clean areas can be caused by bacteria from regions like the anus. The paraffin wax is particularly efficacious on easily constricted areas like the arms and

Fig. 6.—The patient's right palm was burned by hot pitch. He was urged to keep up the muscle tone of the forearm and let the burn heal under the wax spray.

ointments have less viscosity when placed on warm skin and either run off the area if uncovered or are absorbed into the gauze if covered. The higher melting point of the paraffin mixture keeps the areas covered.

The real problem is to preserve as much of the "partial thickness" burned skin as possible. These constitute most of the burn areas. All "full thickness" areas must have skin grafted on them. As soon as the slough has separated, the area should be frosted with sulfanilamide powder and then covered with a heavy coat of wax spray. Over this are placed several layers of gauze, and then a pressure bandage is applied.

This is done only in preparation for skin grafting or if desired when a patient is to be evacuated to another station. The wax separates easily and is still on the gauze surface and not absorbed into its mesh as ointments are. When the dressing is removed the area is smooth.

The type of skin graft to be employed is determined by the area involved as well as by the preference of the surgeon. The Paget dermatome offers the best method in most instances.

A first aid wax ointment can be made by reducing the amount of paraffin in the formula presented to 20

Gm This is spread on waxed paper or cellophane and then applied to the burn or even directly to the burn area in extreme emergencies. The first aid ointment is sometimes incorporated into gauze strips to facilitate application. The paraffin increases the viscosity which

Fig 7—Even thin clothing will protect the skin from intense heat if the duration of the flash is not too long

is an advantage in hot climates. Paraffin also protects the area from gauze.

Military necessity frequently makes hurried evacuations imperative. The spray is sometimes covered by waxed paper or cellophane and may even be held in place by a pressure gauze bandage until the new station is reached. Men may carry a spray gun with them to be used at the new station.

CONCLUSION

Any universally accepted technic of treatment of burns should embody the following principles:

1 It should be simple and inexpensive enough to be available at many stations.

Fig 8—A a flower spray B a hand bath spray C ultraviolet powder to be frosted on moist infected areas under the paraffin wax film D an ordinary insecticide gun a tiny hole in the top releases trapped exuding air and improves its function E an electric globe heater to be used in lieu of boiling water aboard ship F an ordinary water bath.

2 It should be available to and susceptible of being used by untrained persons.

3 It should be complete in itself and not require gauze as experience shows that sterile gauze is not always available at the place where the patient is burned.

4 It should be applicable to any part of the body whether the burned area is on the face, scalp, neck, genitalia, hands or easily constricted areas like the arms and legs or around the eyes, ears, lips and nares.

5 It should be applicable to any type of burn, whether due to flash or fire or to scalding with water or oil.

6 It should be inexpensive.

7 It should stop pain instantly and provide comfort throughout healing.

8 It should keep almost indefinitely.

9 It should allow early free motion to prevent contractures. Increased muscle action will aid morale and increase the appetite.

10 It should allow frequent inspection of all areas by a surgeon or physician at all times without the necessity of removing elaborate dressings.

11 It should prepare areas for early, necessary skin grafting.

12 It should be as effective on old infected burns as it is on fresh ones.

13 It should reduce dressing time by at least 90 per cent over present methods and do so painlessly.

14 It should permit the continuous escape of toxic exudates.

15 It should permit the washing away of odors perspiration and noxious substances by frequent water sprays or showers.

The use of paraffin wax technic as described, has for more than twenty years demonstrated its value in meeting these requirements.

RED CELL TRANSFUSIONS IN THE TREATMENT OF ANEMIA

A PRELIMINARY REPORT

HOWARD L. ALT, M.D.
CHICAGO

The extensive use of human plasma in recent years has made available large quantities of red blood cells. These for the most part have been discarded. Interest in the use of red cells for transfusion purposes has arisen in England during the last few years. MacQuaide and Mollison,¹ Williams and Davie,² and Watson³ all have used concentrated erythrocyte suspensions successfully for the treatment of anemia. In this country Warren Cooksey⁴ has given numerous transfusions of red cells suspended in saline solution. He has been responsible for the increasing interest and use of such transfusions by physicians in the Detroit area.

Red cells were used for transfusion purposes by Robertson⁵ during the first world war and by Castellanos and Riera⁶ in 1937.

In 1938 I gave a transfusion of washed red cells to a patient with subacute leukemia who suffered reactions from whole blood. The same type of reaction occurred with the washed cells. In March 1942 a suspension of red cells was given to a patient with leukemia for the same reason and again failed to obviate the reaction.

Dr. Sidney O. Levinson gave the author helpful suggestions and continued cooperation in this work.

Pepper and Horack⁶ reported the first instance of crystalline sulfathiazole concretions in the renal tubules of a patient treated for pneumonia with sulfathiazole. Shortly after this, Loewenberg, Sloane and Chodoff⁷ reported 1 case of sulfathiazole urinary calculi appearing in the kidneys, ureters and bladder. From pathologic and clinical observations in 4 cases in which death occurred during sulfathiazole therapy, Lederer and Rosenblatt⁸ reported that the significant pathologic lesion was similar to that more recently noted by Merkel and Crawford⁹ consisting of multiple areas of focal necrosis in the liver, spleen, bone marrow, lymph nodes and lungs as well as the kidneys. Winsor and Burch¹⁰ reported 6 cases of severe renal involvement from sulfathiazole with three deaths. The autopsy material showed sulfathiazole crystals within the renal tubules, the tubules were dilated and showed signs of degeneration. Other signs of sulfathiazole damage to the kidney similar to that described by Antopol and Robinson¹¹ were present. Lindner and Atcheson¹² reported 2 cases of complete anuria and death following sulfathiazole therapy. In addition to striking parenchymal changes, the kidneys showed the accumulation of great clumps of crystals in the tubules and calices in 1 case and of crumbly brownish crystalline material within the pelvis and ureters in the other. In no instance, however, has a radiopaque calculus or pelvic caliceal membrane been reported as forming directly or indirectly from sulfathiazole.

According to earlier records, sulfadiazine was more potent, less toxic and less likely to precipitate in the urine and therefore less apt to cause renal complications than any of the other sulfonamide drugs. However, many reports have since appeared of severe renal damage due to the newest of the sulfonamides. Lehr and Antopol¹³ reported renal lesions caused by sulfadiazine in rats and interpreted their significance. Gross, Cooper and Hagen¹⁴ postulated that because urolithiasis occurred in rats given sulfadiazine this complication would occur also in man. They concluded that crystal deposition took place almost exclusively within the renal tubules and commented on the absence of hematuria because of the fan shaped, rounded contour of the crystals and also on the absence of tissue trauma because of imprisonment of the crystals within the tubular structures. Other authors, including Plummer,¹⁵ Flippin and his co-workers¹⁶ and Finland and his associates,¹⁷ reported the incidence of hematuria as

small. Thompson, Herrell and Brown¹⁸ noted a case of anuria after sulfadiazine therapy. Hughes, Sayen and La Towsky¹⁹ reported a case in which actual urinary calculi recovered from the urine were composed entirely of sulfadiazine. These calculi varied from 1 to 3 mm in diameter. Bradford and Shaffer²⁰ reported a death due to sulfadiazine in which the renal changes were similar to those reported in experiments on animals by Antopol and his associates.²¹ An accumulation of precipitated, noncrystalline, free drug was demonstrated within the urinary tract. Following prolonged sulfonamide administration, the resulting uroliths were composed of acetylated drug and the authors used the term "calcifying nephrosis" to describe the reaction in the tissues adjacent to the drug deposits. Special staining demonstrated calcium deposition not only in the zone adjacent to the tubules but also within the lumen. Intense inflammatory changes and extensive necrosis occurred in tissue surrounding the drug deposit when the accumulations were not removed by irrigation within twenty-four hours. Apparently no roentgenograms were available to determine the possible radiopaque nature of this calcareous deposit about and within the renal tubules. Schulte, Shidler and Niebauer²² reported a case of death from anuria due to sulfadiazine. Rames²³ reported an instance of ureteral obstruction and death following the use of sulfadiazine, and Hellwig and Reed²⁴ reported a case of anuria in which death occurred following sulfadiazine therapy. Keitzer and Campbell²⁵ reported 11 cases of renal suppression following sulfadiazine therapy, in 4 of which cystoscopy and ureteral catheterization were required.

For the most part, authors have indicated that sulfathiazole and sulfadiazine crystals precipitated within the renal pelvis and calices are highly soluble and will dissolve readily either under renal pelvic lavage with sterile distilled water through a ureteral catheter or spontaneously if the drug is discontinued and fluids are forced. Crystals precipitated within the renal tubules are not amenable to such therapy. Although there have been no reports of large, conglomerate, putty-like calculi forming within the renal pelvis and calices during sulfathiazole or sulfadiazine therapy, such an occurrence following sulfapyridine therapy was recorded recently by Newman and Shleser.²⁶ In their case the earthy, crumbly, conglomerate mass was removed surgically two years after the sulfapyridine had been administered. That a similar situation may occur during or after sulfadiazine or sulfathiazole therapy when certain precipitating factors such as high urinary concentration and partial or complete ureteral obstruction are present is suggested by the 2 cases here reported.

REPORT OF CASES

CASE 1—R C S a man aged 48 entered the Methodist Hospital on Feb 1, 1942. A small calculus 4 mm in diameter was demonstrated in the lower portion of the right ureter which produced mild ureterectasis and pyelectasis. A ureteral catheter was manipulated past the calculus with difficulty and after 10 cc of dark concentrated urine was aspirated from the right kidney pelvis the patient was relieved of pain in the right flank. Sulfathiazole was given in doses of 60 grams (4 Gm) daily during the next three days. It was discontinued the fourth day because of nausea and resumed the following day in 30 grain (2 Gm) daily doses until February 12, when cutaneous manifestations and fever developed. These apparently were due to drug sensitivity or idiosyncrasy, because the fever and rash promptly subsided after the drug was discontinued. The total dosage of sulfathiazole over the eleven day period was 31 Gm. On the last day of drug administration the blood sulfathiazole level was 37 mg per hundred cubic centimeters and the non-protein nitrogen was 31 mg per hundred cubic centimeters. Adequate fluid intake and output were maintained during this period.

On February 9 ureteral instrumentation was again carried out. A ureteral catheter was introduced easily past the calculus to the right renal pelvis, and 35 cc of dark brownish urine aspirated from the renal pelvis showed 10 to 12 pus cells and 75 to 100 red blood cells per high power field in the uncentrifuged specimen. Sulfathiazole crystals were not seen. Roentgenograms showed no shadow to indicate calculus other than that in the lower portion of the right ureter. The retention ureteral catheter failed to drain adequately owing to the thick consistency of the urine, and therefore it was removed a few hours after insertion, 2 cc of sterile liquid petrolatum being injected as the catheter was withdrawn. The patient left the hospital on February 16.

During the next two weeks the patient continued to have dull aching pain in the right flank and intermittent fever. On February 28 a right ureteral catheter was passed easily to the right renal pelvis and the irrigating fluid returned clear. The renal pelvis was irrigated with 1 per cent silver nitrate solution and the catheter was removed. Roentgenograms showed no calculi either in the ureter or in the renal pelvis although the patient was not conscious of having passed a stone.

During the next month the patient had intermittent fever, uncontrolled gross pyuria, general evidence of sepsis and dull aching pain in the right flank. On numerous occasions the urine was noted by the patient to contain dirty gray shreds and particles. On March 9 the patient brought in a specimen of urine containing a piece of dirty gray membranous material measuring 4 mm in diameter and 3 inches (7.5 cm) in length.

An excretory urogram on March 23 demonstrated moderate impairment of function of the right kidney and numerous calcareous shadows measuring from 5 to 10 mm in diameter, located within moderately dilated right renal calices.

Removal of the calculi by nephrotomy or pyelotomy seemed advisable and operation was carried out on March 27. Moderate perinephric and periureteral inflammation was encountered. When the renal pelvis was opened several ounces of foul smelling but fairly clear urine was released and digital exploration of the calices and pelvis failed to locate any calculi. Because of the severe inflammatory reaction in the renal parenchyma and pelvis nephrectomy was done.

The kidney was inspected minutely and no calculi were found. The pelvis and calices were partially covered by an adherent dirty gray membrane resembling the material recovered from the urine two weeks before. Some of this membrane was stripped from the walls of the calices. It felt gritty and under the fluoroscope it cast a definite shadow. No crystals were seen in scrapings of this membrane. Pathologic examination by Dr C P Baker revealed that the right kidney weighed 145 Gm. The capsule was firmly adherent. In the cortex and running into the medulla were yellow gray areas measuring 1.4 cm. These were found in both poles of the kidney. The pelvic mucous membrane and that of the calices was thickened. In some of the calices there was calcareous inspissated material.

Sections showed noticeable polymorphonuclear leukocyte collections in the medulla and cortex. The diagnosis was severe pyelonephritis with calcareous inspissated material.

The patient left the hospital on the fourteenth postoperative day and has remained well during the fourteen months since operation.

During the eleven day interval of sulfathiazole therapy, 31 Gm of the drug was administered, the fluid intake and output were adequate and no sodium bicarbonate was given. The nonprotein nitrogen did not rise and the blood sulfathiazole level at the end of this period was only 37 mg per hundred cubic centimeters. The fact that his fever promptly subsided after the drug was discontinued suggests a drug idiosyncrasy or sensitization. No renal shadows were seen until approximately six weeks after the drug was discontinued. While there is no definite proof that sulfathiazole was

Fig 1 (case 2) — Appearance on May 6, 1942 showing a shadow 5 mm in diameter interpreted as a ureteral calculus in contact with the ureteral catheter that has been passed slightly beyond it. Note particularly that there is no evidence of right renal calculus.

the primary cause of the formation of the radiopaque membrane within the renal pelvis and calices. I find no record of such a complication of ureteral calculus reported before the sulfonamides were available. Gross renal infection and unilateral urinary stasis were probably contributing factors but may have been major factors in the cause of this lesion. The decision to remove what were thought to be putty-like calculi from the renal pelvis and calices by operation seemed logical. It is quite possible however that this membranous material might have passed spontaneously as in case 2, although in this instance nephrectomy was desirable because of the gravity and extent of the associated pyelonephritis.

CASE 2—E B a man aged 63 an accountant was admitted to the Methodist Hospital on April 29, 1942 with right renal colic of over a four hours duration. An excretory urogram

on April 30 showed a right ureteral calculus 5 mm in diameter located 10 cm above the ureterovesical junction. The portion of ureter above the calculus, the renal pelvis and the calices were slightly dilated. Both kidneys had good function. One ureteral catheter was passed by the calculus on May 1 but was removed after forty-eight hours because it drained poorly.

Fig. 2 (case 2)—Appearance one week after that shown in figure 1 with two right ureteral catheters. No radiopaque material has been detected. What at first appears to be a stricture calculus filling the pelvis and calices is in reality a radiopaque membrane lining the mucosa in this area. Note the variation in density strongly suggesting the membranous nature and note too that the catheters extend beyond the medial border of the shadow. Repeated irrigations with sterile water failed to effect any change in the appearance of this shadow.

in spite of frequent irrigations with sterile water. During a period of four days, starting May 1, 11 Gm of sulfathiazole was given and oral fluids were forced. Because of diminished urinary output, chills and fever occurring May 4 and 5, cystoscopy was repeated on May 6 and a catheter was introduced past the right ureteral calculus to the renal pelvis, where 5 cc of dark, reddish, turbid urine was aspirated. By x-ray examination no shadows were noted in the renal or ureteral areas, with the exception of the small ureteral calculus previously noted (fig. 1).⁷

The ureteral catheter was left for continuous drainage and kept open by frequent irrigations with sterile water. During the four days that the catheter remained, the fluid intake was maintained by mouth and augmented by intravenous dextrose solution, and the urinary output was noticeably increased to a normal level. Sulfadiazine was started on May 6 and continued until May 12 in moderate divided daily doses. A total of 19 Gm of the drug was given in the seven day period. The sulfadiazine blood level on May 12 was 52 mg per hundred cubic centimeters. The nonprotein nitrogen blood level on May 9 was 394 mg per hundred cubic centimeters and on May 12 it was 425 mg. Because of mounting nonprotein nitrogen, chills and fever, cystoscopy was repeated on May 13. After a right ureteral meatotomy was done, two No. 6 x-ray ureteral catheters were passed by the ureteral calculus to the renal pelvis, where 15 cc of yellowish brown, grossly infected, turbid

urine was aspirated. Roentgenograms taken at this time showed a calcareous membrane covering the entire surface of the mucosa of the upper and middle calices and upper part of the renal pelvis (fig. 2). This remained even after repeated renal pelvic lavage with sterile water. The two ureteral catheters were left for kidney drainage. Nearly continuous sterile water irrigation of the renal pelvis through the two ureteral catheters during the first twenty-four hours failed to show any appreciable change in the extent of the calcareous membrane. Sodium citrate-citric acid solution (sodium citrate 452 Gm, citric acid 38 Gm, distilled water 1,000 cc) was used for irrigation during the next twenty-four hours, again without appreciable change in the radiographic appearance of the right renal calcareous shadow. The catheters were removed. The renal output had improved and the nonprotein nitrogen had come down to 338 mg per hundred cubic centimeters on May 16. The blood sulfadiazine had come down to 07 mg per hundred cubic centimeters on May 16. Cystoscopic examination on May 18 revealed calculus 5 mm in diameter in the bladder, which was removed. A right ureteral catheter passed through the wide open right ureteral meatus could be introduced only 20 cm up the ureter, where it met an obstruction which was shown by x-ray examination to be due to masses of calcareous deposits in the upper part of the ureter. Other calcareous deposits were noted in the lower calices and at the ureteropelvic junction. The catheter was removed. During the following week the patient improved rapidly, he was free from pain and his temperature remained normal. He was dismissed from the hospital on May 25. Excretory urograms on May 23 showed the right kidney to have fair function and little hydronephrosis, and the calcareous deposits had nearly disappeared from the inferior calices, ureteropelvic junction and upper part of the ureter, although the shadow in the upper calices remained unchanged. The nonprotein nitrogen remained normal. The urine was grossly infected.

The patient returned to his work on June 12. On June 26 he had a sudden onset of right renal and ureteral pain. Cystoscopic introduction of a right ureteral catheter and aspiration of 40 cc of dark gray, turbid urine from the right kidney pelvis gave the patient immediate relief. The renal pelvis was thoroughly irrigated with acriflavine solution and 1 per cent silver nitrate. Three days later he voided a large, dirty gray, membranous mass followed by a large amount of turbid gray urine. This material was placed in a bottle of sterile water and roentgenographed (fig. 3). Note that the membranous material resembles closely the shadows previously noted in the right renal pelvis in size, contour and configuration. On July 9, another x-ray examination (fig. 4) showed that the main radiopaque cast was absent from the right superior calyx, although two small, partially calcified encrustations about 6 mm in

Fig. 3 (case 2)—Appearance of the membranous material recovered from the patient's voided urine on June 29, forty-seven days after it was first visualized. The membranous material is suspended in a bottle of water. Note that the density and contour resemble the shadow demonstrated in figure 2.

diameter persisted in the superior and middle calices and no calcareous deposits were evident in the ureter. On July 31 the urine was crystal clear and no pus cells were seen on microscopic examination. The patient is now symptom free.

Microscopic examination of the urine and scrapings from the membrane showed sulfathiazine crystals. The microscopic paraffin sections were not diagnostic and showed only amorphous material. The crystals had been dissolved in the process of making the sections. Chemical analysis of the membrane was not made.

No attempt to render the urine alkaline was made during the period of sulfonamide therapy. Sulfonamide drugs were given during the thirteen day period from May 1 to May 12 with the exception of one day (May 5). A total of only 11 Gm of sulfathiazole was given in a five day period. Then sulfadiazine was given for seven days, the total dose being only 19 Gm, at the end of which time the sulfadiazine blood level reached only 5.2 mg. per hundred cubic centimeters. Sunderman, Pepper and Benditt²⁸ have shown that the acetyl derivative of sulfathiazole is only one tenth as soluble in urine as is the free form, and both are one half as soluble in urine of pH 5.6 as that of pH 7.6. This finding has been corroborated by Curtis and Sobin.²⁹ Since the urine in this case was persistently acid with few exceptions, during sulfonamide therapy alkalis should have been given. While the renal output was consistently below normal during the first six days of sulfonamide therapy, it was adequate during the remainder of the time. This does not necessarily indicate that the output was sufficient from the right kidney, and it must be assumed from the clinical course that drainage from the right kidney was definitely impaired until the calculus was passed on May 17. Certainly, the partial or complete obstruction of the right ureter during this time would render the urine in the renal pelvis highly concentrated and this associated with infection would produce an ideal situation for a deposit of the acetyl and free forms of the sulfonamide drugs.

Sulfonamide compounds would seem contraindicated when ureteral obstruction exists.

The radiopaque calcareous membrane formed very rapidly for it was not present on May 6 (fig. 1) although perhaps a membranous deposit had already

Fig. 4 (case 2).—Check up of the right renal area on July 9. Most of the radioopaque membranous material has separated and passed down the ureter.

formed but had not become calcified and therefore was not demonstrable on x-ray examination. On May 13 the membrane was distinctly visible (fig. 2). It is probable that the sulfathiazine rather than the sulfathiazole was the cause because sulfathiazine crystals were noted in the urine and in the scrapings from the membrane.

That the sulfonamide compounds were not the major cause in the formation of the membrane is highly possible. Other factors, such as infection and obstruction, may have played a more important part, but I have never encountered a radiopaque membrane lining the pelvis above a ureteral calculus, nor have similar cases been reported by others prior to the sulfonamide era.

SUMMARY AND CONCLUSIONS

Two cases were observed in which a calcareous radiopaque membrane formed on the epithelial surfaces of the calices and renal pelvis of a kidney partially or completely blocked by a small ureteral calculus. Sulfathiazole in 1 instance and sulfadiazine in the other are thought to be at least partly responsible for this complication. Similar sulfonamide renal complications have not previously been reported. The membrane and kidney were available for study in 1 case and only the membrane passed spontaneously in the other.

Sulfathiazole and sulfadiazine may cause rapid formation of a nonsoluble calcareous, radiopaque membrane on the epithelial surfaces of the calices and pelvis if there is an associated ureteral stasis, pyelonephritis and alkaline urine. Therefore these drugs should not be given indiscriminately in such cases but if thought mandatory, every effort should be made to prevent the formation of such membranes by correcting ureteral stasis, maintaining renal drainage, improving the renal output and rendering the urine highly acid (pH 5.6 or less).

Early operative removal of such membranes is not indicated, for it is quite impossible to remove this material early either by nephrotomy or pyelotomy, when separation from the pelvis and calices is difficult. Later such membranes may separate spontaneously and are then more easily removed, or they may pass without operation.

527 Medical Arts Building

The Per Capita Consumption of Sugar.—World production of raw sugar in 1939 was not far from 35 million tons. Of this nearly 22 million tons came from the sugar cane and considerably more than 12 million tons from the sugar beet. The United States and its island possessions produced about 5½ million tons. Louisiana and Florida are the leading cane sugar states, California and Colorado the chief beet sugar states. In the United States the per capita consumption of sugar rose from about 40 pounds a year (raw value) in the decade 1870-1879 to 107 pounds in 1920-1929 but dropped back to 102 pounds for the period 1930-1939. In prewar years several other countries reported still higher consumption of sugar but the figures are not available at present. The world average sugar consumption was reported to be 30½ pounds per capita for the season 1939-1940 for one year. The desirability of such a large consumption of sugar in the United States is doubtful. Sugar supplies about one sixth of the caloric needs and hence displaces the consumption of less refined foods that would carry minerals and vitamins as well as energy.—Peterson, William H., Skinner, John T. and Strong, Frank M. *Elements of Food Biochemistry*, New York: Prentice Hall Inc. 1943.

CONTINUOUS CAUDAL ANESTHESIA IN
THREE HUNDRED UNSPLICED
OBSTETRIC CASESMAJOR JAMES M. SILVER
MEDICAL CORP., ARMY OF THE UNITED STATES
ANDMAJOR FLOYD H. MOUSEL
MEDICAL CORP., ARMY OF THE UNITED STATES

The history of continuous caudal anesthesia for obstetrics was discussed by Edwards and Hingson¹ in 1942 and later by Hingson and Edwards² and by Gready and Hesselstine.³

This paper is an analysis of 300 obstetric cases at the Brooke General Hospital in which continuous caudal anesthesia was employed. In 288 anesthesia was satisfactory; in 12 it was not and supplementary anesthesia was necessary. This type of anesthesia was used for all patients admitted to the hospital for delivery with a few exceptions which will be mentioned. The 300 cases which form the basis of this report therefore represent an average group and are not selected cases. The only obstetric patients for whom this type of anesthesia was not used were those who presented definite obstetric contraindications such as placenta previa, contracted

hours until the membranes ruptured, whereupon rapid completion of dilatation would ensue. For this reason we artificially ruptured membranes at this stage and thereby considerably shortened labor in these cases. This absence of progress should be watched carefully, otherwise prolonged labor may result.

The second stage of labor was altered greatly by continuous caudal anesthesia. This was particularly true among primiparas. The patient did not have any desire to bear down because of the anesthesia of the perineum. For this reason the head may be left on the perineum for hours if the attending doctor is not watchful.

Multiparas were able to push the baby out rather easily when instructed to do so. Primigravidas were unable to do this even after prolonged pushing. In 20 cases we attempted to have primigravidas expel their babies. In all of these cases the level of anesthesia was well below the halfway mark between the symphysis and the umbilicus. Yet, in all of these cases, after two hours of pushing with their contractions, little progress was made. It is our belief that more than two hours pounding on the perineum is dangerous to the welfare of the infant. For this reason it was necessary to perform episiotomy on all primiparas, and for 70 per cent of our primiparas forceps also were necessary for delivery.

Posterior positions were much more common when caudal anesthesia was employed than in our previous cases. Posterior positions occurred in 10 per cent of the cases, whereas we previously observed it in only 4 per cent. This change was attributed to the relaxation of the levator muscles with the resultant failure of a large number of fetuses to rotate spontaneously. This was compensated for by the ease with which rotation could be effected. This was true only if time was given for the head to descend to the perineum. It was our policy to allow babies in the posterior position to remain on the perineum for two hours and then to rotate the child if rotation had not taken place. Rotation will occur in about 50 per cent of cases under caudal anesthesia. It has been noted in posterior positions that as the head descends through the pelvis the patient experiences severe pressure pains in the back and in the pelvic bones that cannot be relieved by caudal anesthesia. This pain apparently has no relation to uterine contractions, as it is constant. The patients are completely relieved of uterine pain even in the presence of severe pressure pains.

As we have had only four breech presentations in this series, little can be said except that the babies were delivered with ease owing to the relaxation of the perineum. This was also true of the one set of twins. One of these had a breech presentation and the other a cephalic, both were delivered with ease, as the mother had two children and pushed both out spontaneously when instructed to do so.

The third stage of labor should be managed carefully. Oxytocics should not be given prior to separation of the placenta, nor should the uterus be manipulated before separation takes place. If oxytocics are given or the uterus is manipulated earlier, tetany of the uterus is likely to occur and a retained placenta results. One should leave the uterus entirely alone until separation of the placenta takes place, then gentle traction may be made on the cord and, placing the other hand on the abdomen one pushes the uterus gently upward with the thumb, thus the uterus is pushed away from the placenta. When this maneuver is completed, the placenta will be in the vagina and a gentle push on the

Number of Pregnancies and Complications in 300 Obstetric Cases in Which Continuous Caudal Anesthesia Was Employed

Number of pregnancies	Cases
First pregnancies	276
One or more previous pregnancies	24
Complications	
Breech presentation	4
Posterior position	25
Spontaneous rotation	10
Forceps rotation	18
Multiple pregnancies (twins)	1

pelvis or some abnormality of the sacrum or coccyx. This series included anterior posterior and breech presentations, one face presentation and one set of twins, as may be seen in the accompanying table.

The type of solution used was a 1.5 per cent solution of procaine hydrochloride. The amount given varied considerably, depending on the length of labor and how quickly the continuous caudal anesthesia was started. The largest quantity used was 1,000 cc. and the least was 30 cc. The longest administration was twenty-four hours and the shortest thirty minutes. The average anesthesia time was eight hours and twenty minutes.

The first stage of labor was conducted along natural lines. If its progress was to be normal, it was necessary to watch the level of anesthesia. In our cases we found it expedient to keep the level of anesthesia halfway between the symphysis and the umbilicus. If it was allowed to become lower anesthesia was not complete, and if it extended higher progress of labor was impaired.

It was noted early in our series that in many cases labor progressed rapidly until the cervix was dilated 7 or 8 cm. and then would make no progress for several

uterus in order to make it act like a piston will deliver the placenta. Gentleness cannot be stressed too much in these maneuvers, otherwise tetany of the uterus will result with retention of the placenta. If the method just described is used, considerably less blood is lost than in cases in which caudal anesthesia is not used. Delivery by Crede's method should never be attempted.

The over-all length of labor was slightly increased in cases of continuous caudal anesthesia. The average length of labor in our cases before caudal anesthesia was employed was eight hours, since caudal anesthesia has been used it has been fourteen hours. This is attributed to the prolongation of the second stage of labor. It has been our policy in this series to take the patient to the delivery room when the presenting part can actually be seen at the vulva.

In the 300 cases no maternal mortality occurred. No effect was noticed on the baby, all cried spontaneously on delivery. Three babies were lost, but the causes were entirely unrelated to the anesthesia. This is a very low fetal mortality rate and may signify that labor under caudal anesthesia is less traumatic to the baby. It cannot be accounted for in any other way.

INDICATIONS FOR STARTING CAUDAL ANESTHESIA

We have learned that certain conditions should be fulfilled before continuous caudal anesthesia should be started. These hold true only for primigravidas, as the caudal anesthesia may be started for multigravidas as soon as definite labor is established. These conditions are as follows: (1) The head should be engaged, (2) contractions should be occurring at five minute intervals or less, (3) there should not be any disproportion between the presenting part and the pelvis and (4) dilatation of the cervix of 1 cm or more should have occurred.

In the first 20 to 30 cases caudal anesthesia was started before the cervix was dilated 1 cm and in some cases before contractions were five minutes apart. In all these cases labor was slowed down definitely and in some it was stopped completely. It was then necessary to let the anesthesia wear off before labor progressed. Caudal anesthesia was started again when the requirements just listed were met. Labor was concluded rapidly. These observations demonstrated that caudal anesthesia should not be started too soon. In the last 150 cases the foregoing indications have been fulfilled before caudal anesthesia was started, and uniformly good results have been obtained.

COMPLICATIONS AND PRECAUTIONS

The dangers of this type of anesthesia may be grouped under three headings: (1) infection, (2) injection into the cerebrospinal space and (3) circulatory collapse.

Infection should be seriously considered as the needle is introduced through a region which is hard to sterilize. In our first cases the site of injection was cleansed with soap and water followed by an antiseptic solution. In the first 50 cases in our series one epidural abscess occurred. The patient was seriously ill for three weeks but responded to large doses of sulfonamide compounds and completely recovered. Since that time we have cleansed the part with soap and water followed by alcohol and ether and then have printed it with an antiseptic solution. It must be stressed that strict asepsis is absolutely essential during the entire technic.

Injection into the dura is obviously dangerous, and the precautions to be taken will be explained in the

technic of administration. This complication did not occur in any of our 300 cases.

The most serious danger is that of circulatory collapse. This occurred in 3 of our 300 cases. In 1 of these the blood pressure and pulse could not be obtained and the fetal heart rate became irregular and almost stopped. The baby put out large quantities of meconium, which was evidence that it was in distress. Epinephrine was given intravenously, and both mother and baby recovered without any apparent ill effects.

To prevent such collapse, 2 minims (0.12 cc) of epinephrine was placed in the first 25 cc of the anesthetic solution injected. This was repeated in subsequent injections only when the systolic blood pressure fell to less than 100 mm of mercury. Since this method was adopted, we have not had any further cases of collapse. Such a small quantity of epinephrine has no effect on labor, and any other effect it may exert is purely transitory.

CONTINUOUS CAUDAL ANESTHESIA IN CASES OF ECLAMPSIA

Continuous caudal anesthesia was used in the treatment of 3 patients who had eclampsia in this hospital. All of these had one or more convulsions, and use of continuous caudal anesthesia gave similar results. The following is a summary of one of the cases.

The patient's blood pressure measured in millimeters of mercury was 190 systolic and 110 diastolic on admission. An attempt was made to quiet her with sedation but her condition failed to improve. Later on the day of admission, blindness developed suddenly. At this time the membranes ruptured and the patient went into active labor. One hour after labor started, she had a convulsion lasting two minutes and went into coma. Blood pressure at this time was 200 mm systolic and 120 mm diastolic. Three hours after labor started continuous caudal anesthesia was begun. The systolic blood pressure immediately dropped to 130 mm and the diastolic to 90. The patient came out of the coma and was rational for the first time in four hours. The headaches and dizzy spells that she had complained of all day were gone and she stated that she felt fine. The blood pressure remained less than 150 mm systolic and 90 diastolic throughout the entire course of labor and the patient was delivered of a normal living child. She did not have any more convulsions nor did she return to coma.

In the other 2 cases of eclampsia the histories were similar and results were equally satisfactory. More work is being done on this phase of continuous caudal anesthesia. It should be pointed out, however, that these patients should be watched for circulatory collapse, as too great a drop in blood pressure might be disastrous.

TECHNIC OF PRODUCING CONTINUOUS CAUDAL ANESTHESIA

The patient is placed on her right side in a modified Sims position and close to the side of the bed. The lumbosacral region is scrubbed with soap and water followed by alcohol and ether. Tincture of mercuriolate then is applied to the region and sterile drapes are put in place. A skin wheal is raised over the sacrococcygeal ligament. A 13 gage needle is passed through the skin wheal and is advanced through the sacrococcygeal ligament. After the tip of the needle comes into contact with bone on the anterior border of the caudal canal, the needle is rotated 90 degrees to bring its bevel against bone. The needle is then advanced about 1 inch (2.5 cm). A glass syringe containing 25 cc of the anesthetic solution is attached to the needle and 1 or 2 cc of the anesthetic solution is injected to clear the

needle or any obstruction. The plunger is withdrawn gently in order to make sure that the tip of the needle is not lying within the lumen of a blood vessel or within the subarachnoid space. Twenty-five cc of the anesthetic solution is injected slowly into the caudal canal.

As soon as the initial dose has been injected the syringe is detached from the needle and a No. 5 French nylon ureteral catheter which has been sterilized in an autoclave is passed through the needle and is advanced until the tip of the catheter is approximately $1\frac{1}{2}$ inches (3.8 cm) above the sacral hiatus. The catheter is now supported in place while the needle is removed. The catheter is taped to the skin and the region is sealed with adhesive tape to prevent soiling from the perineum. The patient may now be turned on her back and made comfortable. It is important to refrain from advancing the tip of the catheter more than $1\frac{1}{2}$ inches (3.8 cm) into the caudal canal. If the catheter is placed high in the canal, unilateral anesthesia may result.

Additional injections of 25 cc of the anesthetic solution are given whenever the patient begins complaining of discomfort.

COMMENT

We believe that the catheter method is much safer than the method of using an indwelling needle. If a needle breaks in the caudal canal surgical intervention for its removal will be necessary. Indwelling needles also produce an unnecessary amount of trauma inside the caudal canal. The sacrococcygeal ligament acts as a fulcrum, holding the hub of the needle in a fixed position. Every motion of the patient will cause the tip of the needle to sweep the inside of the caudal canal, damaging the vascular plexus and traumatizing the periosteum. This cannot happen if the needle is replaced with a flexible ureteral catheter.

The position of the patient during the initial injection is important. We do not believe we are justified in employing the knee-chest position. If the patient is placed in a modified right Sims position near the edge of the bed it is an easy matter to reach over her and place the needle and catheter in the caudal canal.

We have kept our patients in a slight Fowler position during labor. This prevents the anesthesia from ascending to an unnecessary height and also prevents the fall in blood pressure and nausea which frequently occur if the anesthetic solution ascends to envelop the thoracic nerves.

Our first 25 or 30 patients were anesthetized with 1.5 per cent solution of procaine without epinephrine. In these cases we observed a few who had a sudden lowering of blood pressure followed by a feeble thready pulse, nausea and vomiting. Since that time we have included 2 minims of epinephrine with the initial injection for all patients except those with toxemia. We have not observed evidence of cardiovascular collapse since epinephrine was added to the anesthetic solution, nor have the patients become nauseated.

We have used metycaine for a number of patients and have not been able to demonstrate results superior to those obtained with procaine. Procaine has been used in the majority of our cases because we believe it to be the safest local anesthetic agent available at present.

CONCLUSIONS

1 Continuous caudal anesthesia is satisfactory in most cases.

2 We feel that the use of a ureteral catheter is safer and more comfortable for the patient.

3 Epinephrine should be added to the initial injection of anesthetic solution into the caudal canal in all cases except those of toxic reactions.

4 Continuous caudal anesthesia may be of service in cases of eclampsia, for 3 patients with eclampsia were delivered while under caudal anesthesia without any maternal or fetal death and with apparent control of symptoms of toxemia.

5 Absolute asepsis must be observed at all times.

6 A lower fetal mortality rate than usual was noted.

EXCRETION OF THIAMINE, RIBOFLAVIN, NIACIN AND PANTOTHENIC ACID IN HUMAN SWEAT

CHICAGO

The excretion of vitamins in sweat is of interest from the standpoint of the metabolism of such vitamins in the body and the possible loss of such vitamins by this channel, especially in instances of profuse sweating. Such results also have a bearing on the physiology of perspiration. The amount of sweat vitamins might also conceivably have a bearing on the growth of organisms on the skin, since some of these vitamins have a definite effect on the growth of certain micro-organisms.

One of us has reported on the excretion of ascorbic acid in sweat.¹ An increased excretion of this vitamin was noted in sweat after administration of large doses of the vitamin. Hardt and Still² studied the excretion of thiamine as well as of ascorbic acid in sweat after exercise. They concluded that 5 to 15 per cent of ingested thiamine might be the daily loss by way of the sweat and that the giving of 50 mg of thiamine to their subjects led to an increased excretion of thiamine by this channel. Results on niacin, pantothenic acid and riboflavin do not appear to have been previously reported.

We have studied the excretion of thiamine, niacin, riboflavin and pantothenic acid in heat sweat of human subjects with and without the administration of large doses of these vitamins. The subjects were normal men.

METHODS

Specimens of sweat were collected as follows. The subjects were encased in a rubber bag as far as their necks and were seated in a heat cabinet. Incandescent lamps furnished sufficient heat to obtain 100 to 200 cc of sweat in twenty to thirty minutes.

Thiamine was determined by the chemical method of Kirch and Bergeim,³ and niacin,⁴ pantothenic acid.⁵

The expenses of this investigation were met in part by a grant made to the University of Illinois by Standard Brands, Inc. From the Departments of Dermatology, Physiological Chemistry and Chemistry, University of Illinois College of Medicine and of Pharmacy. 1 Cornbleet, Theodore, Klein, R. I., and Price, E. and riboflavin⁶ by microbiologic methods. In the thiamine method the sweat was concentrated by evaporation in vacuo in acid solution. In the other methods the sweat was filtered and heated to kill bacteria before analysis.

In certain instances large doses of the vitamins were given by mouth or by intramuscular injection at different periods before sweating was induced. Details of administration and analytic results obtained are given in table 1.

THIAMINE IN SWEAT

Thiamine values varied from <0.06 to 0.60 microgram per cubic centimeter of sweat. The <0.06 microgram value does not indicate a complete absence of thiamine but merely that the amount was too small to be determined by the chemical method used. In general subjects were given a shower bath shortly (usually about forty-five minutes) before sweating was induced. This was done in order that sweat evaporated on the skin might be removed so that the results obtained would approximate as closely as possible the values for the sweat as it poured out by the sweat glands. Nevertheless some concentration of sweat on the surface of the skin probably occurred in some cases, and some of the values may be somewhat high on this account. This is suggested by the fact that when two successive samples of sweat were obtained the second sample generally showed somewhat lower values for thiamine as well as other vitamins. The lower values in the table are thus probably in general to be given some preference. Further light is thrown on this question by experiments 21 and 22. In experiment 21 two samples of sweat each of 200 cc were collected one immediately after the other. The first sweat should have washed the skin well, so that the second sweat should have been a fairly pure secretion. Yet analysis for the vitamins shows little change in values. Nor were the results much different in experiment 22 in which a single specimen was taken from the same subject without previous bathing. Experiment 22 may have been influenced by the fact that on the day of sweating the outdoor temperature was around 95° F and hence fairly profuse sweating had occurred before the sample was taken. That the influence of evaporation of sweat on the skin in these experiments was not such as strongly to affect the results is further indicated by the reasonable constancy of the findings and by comparisons such as were made in experiments 19 and 20 in which the findings were similar in spite of the fact that in the first test the subject was given two baths at forty-five minutes and five minutes before sweating was induced and in the second case no bath at all was given on the day of sweating.

An average value of 0.2 microgram per cubic centimeter of sweat was obtained. For reasons stated this figure may be a little high and the value of 0.15 microgram may be more nearly representative. A really definitive average would require a larger number of cases. 0.15 microgram per cubic centimeter would correspond to 150 micrograms per liter of sweat. Hardt and Still⁷ found about 90 micrograms per liter in their experiments.

The physiologic significance of these results is not entirely clear. Williams⁸ gives figures on the amounts

of these vitamins contained in a well rounded diet (2,500 calories). For thiamine he gives a figure of 3 mg a day. Lane, Johnson and Williams⁹ calculate, however, that the thiamine content of the average American diet, such as was consumed by the middle two thirds or three fourths of the population prior to the advent of enriched bread and flour was about 0.8 mg per 2,500 calories and that if the use of enriched flour and bread becomes universal the average intake will be increased to about 1.3 mg per 2,500 calories. Taking the figure of 150 micrograms per liter of sweat, one would have in this amount of sweat about 5 per

TABLE 1—Thiamine, Riboflavin, Niacin and Pantothenic Acid in Sweat (Micrograms of Vitamin per Cubic Centimeter of Sweat)

Ex periment	Thi amine	Ribo flavin	Niacin	Panto thenic acid	Type of Diet and Comment

20	0.20	0.6	0.20	0.19	Same as 19 but no bath on day of sweating
21A	0.40	0.20	0.12	0.50	Regular diet first 60 cc of sweat
21B	0.50	0.30	0.10	0.20	Same as 21A second 60 cc of sweat
22	0.5	0.19	0.15	0.19	Same as 21A but no bath on day of sweating

cent of a good intake or about 11.5 per cent of the 1.3 mg figure for the average American diet. Under average conditions of temperature and humidity and light work the amount of sweat may not be much over 500 cc a day. Any increases in temperature and amount of work readily increase the amount of sweating, so that with warm weather or fairly active work 2 to 3 liters of sweat may be secreted and with a hot environment and active work considerably larger amounts of sweat may be poured out. With 3 liters of sweat the loss by secretion would correspond to about 15 per cent of intake on a good diet and more than 30 per cent of intake on the average American diet,

taking the 1.3 mg figure. Hardt and Still figured that 5 to 15 per cent of ingested thiamine is lost with moderate temperature and work. It would seem that under average conditions the loss of thiamine in sweat, while appreciable, might not be of great physiologic significance. With profuse perspiration the loss might well be of sufficient concern to warrant special precautions to insure that the thiamine level of the diet did not fall too low. It must, of course, be borne in mind that some persons may excrete more than the average amount on which these calculations are based and some definitely less.

RIBOFLAVIN IN SWEAT

Riboflavin values found for sweat were 0.03 to 0.30 microgram per cubic centimeter, or an average of 0.15 microgram. With some special emphasis on the lower values or reasons previously stated, the average would be nearer 0.12 microgram. This would be 120 micrograms per liter of sweat and a little over 3 per cent of the figures of Williams for a good diet (37 mg a day or about 5.5 per cent of a more nearly average American intake of 2.2 mg). These values are somewhat less than those obtained for thiamine, and the physiologic significance of the losses by sweat may be somewhat less. The loss under average conditions is probably not of great importance but might become so in case of profuse perspiration and diets not optimal for this vitamin.

PANTOTHENIC ACID IN SWEAT

For pantothenic acid values of 0.12 microgram to 0.80 microgram were obtained with an average of 0.34 microgram per cubic centimeter of sweat. As the lower values probably represent more nearly the sweat as secreted, a figure of 0.3 microgram may be more representative. If one considers a good diet to contain about 11 mg of pantothenic acid, the loss in a liter of sweat would be about 3 per cent of intake, or for 3 liters about 9 per cent. This loss is proportionally similar to the losses of thiamine and riboflavin and may have a similar significance.

NICOTINIC ACID IN SWEAT

Values for nicotinic acid in sweat were obtained varying from 0.1 to 0.46 microgram per cubic centimeter, with an average of 0.23 microgram. This may be slightly high owing to the concentration of sweat on the skin, so that a value of 0.2 microgram may be more nearly correct. This would correspond to 200 micrograms of nicotinic acid per liter of sweat. This would be about 0.5 per cent of the amount in a good diet or about 1 to 2 per cent of that in more usual but adequate diets. The loss of nicotinic acid in sweat could hardly be of physiologic significance.

INFLUENCE OF HIGH VITAMIN INTAKE

Several experiments were carried out in which the person was given large amounts of each of the vitamins studied either by mouth or by intramuscular injection. The results are given in table 1. The results for thiamine are somewhat irregular, so that further study is needed. The results are complicated by the fact that when no special vitamin is given a second specimen of sweat may contain less vitamin than a first specimen,

owing probably to the fact that the first sweat washes out any adherent vitamin that may have been concentrated on or in the skin. Also, perhaps, because the effects of administration are somewhat transitory. Hardt and Still found that after one hour of exercise the ratio of thiamine in sweat to that in urine might be 7:1 and after an hour and a half only 8.5:1. Our results, as far as they go, indicate that injection or ingestion of thiamine in large amounts may have some effect on excretion in the sweat, but such effect is very slight compared with the amounts so administered.

It may be that there is some effect as long as the thiamine in the blood remains very high but that the thiamine is rapidly removed from the blood by the tissues so as not to be readily called on for excretion. This fits in with the fact that the thiamine content of the blood is very low and exists mostly in combined form. We have tested several specimens of sweat for thiamine pyrophosphate by treating the sweat with phosphatase⁹ before analysis, and our results have always been negative.

No increase of riboflavin was noted in sweat after ingestion or injection of large doses of this vitamin. Nor were definite significant changes noted in the studies on niacin and pantothenic acid. It seems clear, therefore, that when large doses of the four vitamins studied are given by mouth or are injected intramuscularly a considerable part of this vitamin is not excreted in the sweat. This is probably due largely to the fact that these vitamins do not remain in free form in the blood in high concentration for any long period. This appears to be more probable than that the sweat glands have such an extremely low capacity for excretion of these vitamins, since, as shown by Hardt and Still, under certain conditions the excretion of thiamine in sweat may be greater than that in urine. Under ordinary conditions, however, the twenty-four hour elimination of these vitamins by the urine is much greater than in the sweat. It must also be borne in mind that the combined urine and sweat thiamine do not account for more than a part of the ingested thiamine, apparently because of the destruction of the vitamin in the body.

The losses per liter of sweat of about 3 to 10 per cent of the intake for thiamine, riboflavin and pantothenic acid are not much different from the losses of about 4 per cent for ascorbic acid (about 2 mg per liter compared with the adult requirement of about 50 mg a day). Since vitamin C-salt tablets have been reported from the medical division of the du Pont Company as superior to salt alone in cases of profuse sweating, it is possible that the other vitamins might also be helpful under similar conditions.

BACTERIA AND THE VITAMINS OF SWEAT

The bacteriology of the sweat as far as these vitamins are concerned may be considered from two angles. The question arises first as to whether the sweat bacteria destroy or use up the vitamin present or engage in any synthesis. We found on incubating sweat at 37°C for twenty-four hours that there was some decrease in the thiamine level but no change in the pantothenic acid, niacin or riboflavin levels. Under these conditions considerable bacterial growth occurs and the sweat changes from a pH of about 5 to one of about 8. It may be that the destruction of thiamine noted was due to the alkalinity developed. However, it does not appear that

⁹ Stiebeling, Hazel K., and Phipard, Esther F. Diets of Families of Employed Wage Earners and Clerical Workers in Cities, Washington, D. C., Circular 507, United States Department of Agriculture, 1939.

bacteria are much concerned with either the formation or the destruction of these vitamins on the surface of the skin and that the vitamins found are not of bacterial origin.

Further support for this view was obtained in experiments in which 5 cc of sweat was added to 5 cc of plain broth with or without the addition of 20 micrograms of thiamine and incubated at 37 C for twenty hours. No significant change was noted in the amount of thiamine in either case indicating that the bacteria of the sweat neither synthesized nor destroyed thiamine under these conditions. The use of dextrose acid medium in place of plain broth gave similar results, indicating that the pH of the medium was not a factor. The results are shown in table 2.

SUMMARY AND CONCLUSIONS

Heart sweat was found to contain on the average about 150 micrograms of thiamine, 120 micrograms of riboflavin, 300 micrograms of pantothenic acid and 200 micrograms of nicotinic acid. It is possible that these values may be slightly higher than true values for sweat as secreted by the glands because of the difficulty of entirely avoiding concentration due to evaporation on the skin surface. These values per liter correspond

TABLE 2—Sweat Bacteria and Thiamine Destruction and Synthesis

Five cc of sweat plus 5 cc of medium was incubated at 37 C for twenty hours. Bacterial growth was noted in all cases.

Experiment	Medium Used	Thiamine Present Before Incubation Micrograms	Thiamine Found After Incubation Micrograms
1	Plain broth	0	0
2	Plain broth	0	0
3	Plain broth	20	21
4	Plain broth	20	21
5	Acid dextrose broth	0	0
6	Acid dextrose broth	0	0
7	Acid dextrose broth	20	20
8	Acid dextrose broth	20	21

for thiamine to about 5 per cent of intake on a good diet, for riboflavin and pantothenic acid to about 3 per cent and for nicotinic acid to about 0.5 per cent. For average American diets the percentages would be more nearly 10 per cent for thiamine, 5 per cent for riboflavin and 1 per cent for nicotinic acid. The excretion of such amounts of these vitamins cannot be said to be negligible from the physiologic standpoint although perhaps becoming of real importance only in case of rather profuse sweating or on diets low in these vitamins. The elimination of nicotinic acid could hardly be of importance in any case. The losses of the other vitamins are of the same order as losses reported for ascorbic acid in sweat. Since favorable results have been reported in the administration of ascorbic acid in cases of profuse perspiration it is possible that supplements of other vitamins might be worthy of trial under similar conditions. Ingestion or intramuscular injection of large amounts of these vitamins did not lead to any noticeable or persistent increase of their secretion in the sweat.

These vitamins as found in sweat appear to be a true excretion not appreciably influenced by bacteria on the skin. Sweat contains sufficient of these vitamins to promote bacterial growth provided conditions are otherwise favorable. Thiamine appears to exist in sweat only in the free form.

FAMILIAL TUBEROUS SCLEROSIS (EPILOIA) WITHOUT ADENOMA SEBACEUM

REPORT OF TWO CASES

LIEUTENANT JACOB LICHSTEIN
MEDICAL CORPS, ARMY OF THE UNITED STATES

AND
LEON SOLIS-COHEN, MD
Chief Radiologist Jewish Hospital
PHILADELPHIA

Tuberous sclerosis (epiloia, Bourneville's disease) is considered a rare and unusual entity. For this reason its presence as a diagnostic possibility in cases in which epileptiform seizures are present is seldom entertained. Yet the literature on this subject has assumed impressive proportions. In the sixty years from the time Bourneville¹ first described it in 1880 down to 1940 one hundred and twelve reports have been collected dealing with tuberous sclerosis and its related neurocutaneous syndromes (Recklinghausen's neurofibromatosis, angiomas cerebri or Sturge-Weber's disease, and von Hippel-Lindau's disease).

In recent years the roentgenologist has become more alert to the significance of metastatic calcifications (calcified plaques) in survey films of the skull as an identifying feature of tuberous sclerosis, and the internist has in turn been stimulated to search for its other characteristic manifestations. With the increasing use of pneumoencephalography, this type of ectodermosis is being more commonly reported, its features are more clearly defined and more light has been thrown on its hamartial nature and its relation to the tumor problem.²

In this communication it is our purpose to present 2 cases of familial epilepsy in which the weight of evidence is diagnostic of tuberous sclerosis.

REPORT OF CASES

CASE 1.—W. M. Jr. a white man aged 22 seen April 8, 1941 had a history of epileptic seizures and poor vision. He had been a confirmed epileptic since the age of 2 years. In the week preceding the first visit he averaged eight to ten seizures a day. Well defined mental deterioration and periods of irritability had appeared in recent months. He stuttered and had never been able to pursue any gainful occupation. His father's grandfather was known to have had convulsions. A grandfather and aunt were operated on for 'brain tumor'. Physical examination revealed no cutaneous lesions and no evidence of facial rash suggestive of adenoma sebaceum. The extremities showed no loss of motor power. Decided mental retardation was present.

The eyeballs were prominent with a widening of the palpebral fissures. There was a horizontal and rotatory nystagmus present with movement to the right. Extensive choroidal changes were present involving both eyes with a moderately advanced grade of optic atrophy. Large macular atrophic lesions were noted. Myopia of a high grade was found. The lesions were believed by the ophthalmologist to be on the basis of a hereditary macular degenerative process, congenital and colobomatous in origin.

Roentgenograms of the skull showed that the outer table was thick and a number of calcified deposits were seen

From the Jewish Hospital.
Dr. Samuel Levine rendered aid in the interpretation of the roentgenogram.

² Mollon S. E. Hamartial Nature of Tuberous Sclerosis (Epilepsy and Its Lesions), in the Tumor Problem, Report of Cases with Family Anomaly of the Kidney and Adenoma Sebaceum. Arch. Int. Med. 63: 551-729 (April) 1942.

throughout the calvarium 3 to 5 mm in circumference (figs 1 and 2). A pneumoencephalogram (made by Dr Michael Scott) showed focal areas of brain atrophy in the right parietal region. There was an obliteration of the subarachnoid pathways in the right frontal lobe. A number of microgyria were observed. The right ventricle was not outlined by air.

Fig. 1 (case 1) — Lateral view of survey roentgenogram showing metastatic calcifications throughout the calvarium. The patient has epilepsy with mental deterioration and muscular degenerative changes.

Fig. 2 (case 1) — Anteroposterior view showing calcified areas scattered throughout the brain substance, one is situated in the region of the right ventricle.

Numerous small irregularly calcified deposits were seen (figs 3 and 4) which in the opinion of Dr E. P. Pendergrass, were situated within the ventricles. Two masses may be noted in figure 4 located in the region of the unfilled right ventricle in the anteroposterior view.

The hemoglobin content was 135 Gm., and there were 4,950,000 red blood cells and 6,800 white blood cells. Sick cells were absent. Serologic reaction of the blood was negative. No ova or parasites were found on repeated stool examinations. The purified protein derivative test was negative. Blood calcium was 111 mg per hundred cubic centimeters of blood. A roentgenogram of the chest showed clear lung fields, and the long bones presented no alteration in structure or architecture. Intravenous urography showed good bilateral function and no evidence of renal neoplasm or congenital malformation. The patient responded well to phenytoin sodium therapy and at present convulsions have decreased to two slight attacks every three months.

CASE 2—W. M., a white man aged 46, father of W. M. Jr., was seen Nov. 12, 1941 following a typical epileptic seizure of short duration. The history revealed one slight attack twelve years before. Examination, both physical and neurologic, proved negative. The eyegrounds were normal.

A roentgenogram of the skull on the left side in the basal view showed one or two small calcifications situated in the region of the left ventricle (fig. 5).

Fig. 3 (case 1) — Lateral view following pneumoencephalography showing calcifications within the shadow of the left ventricle above the fluid level. Note microgyria.

With phenobarbital and sedatives, the patient was asymptomatic until April 4, 1942, when a convulsion occurred in his sleep.

SYMPTOMS

Tuberous sclerosis, in its classic form, presents the following symptoms: (1) epileptic seizures, (2) mental deficiency, (3) adenoma sebaceum (acneiform eruption, butterfly or bat wing in distribution, involving the nasolabial folds and having a trigeminal distribution), (4) congenital tumors of the eye (van der Hoeve's phacoma) and of other organs including rhabdomyomas of the heart and kidney (hypernephroma or Wilms' tumor), (5) periungual fibromas, (6) cystic changes in the small bones, (7) other less frequent congenital defects such as harelip, cleft palate, hypoplasia of kidney and ureter, pulmonary artery stenosis, simian hands, hypertrophy of the external ears, high arched palate, spina bifida, microcephaly and accessory digits, syndactyly, hemihypertrophy, epicanthus, transposition of the great vessels and intestinal polyps.

PATHOLOGY

Sclerotic potato-like patches are scattered over the surface of the brain, and from this characteristic the name tuberous sclerosis is derived. The heterotopic plaques are distinguished from the normal cortex by their rubbery consistency.⁴ More characteristic are the

Fig. 4 (case 1)—Posteroanterior view of pneumoencephalogram. Arrow indicates calcified mass located in region of right ventricle which did not fill with air.

subependymal proliferations that are found in the lateral ventricles closely associated with the choroid plexuses.

Abortive and latent forms of the disease lacking a fully developed picture have been recognized. Critchley and Earl⁵ classify these as follows:

- 1 Adenoma sebaceum alone
- 2 Adenoma sebaceum with epilepsy and without mental defect
- 3 Adenoma sebaceum with symptoms pointing to intracranial neoplasm
- 4 Visceral tumor alone with familial history of tuberous sclerosis

Demonstrable calcifications within the brain in tuberous sclerosis were first mentioned in the Scandinavian literature when Dalsgaard-Nielsen⁶ reported fleecy calcifications in a boy aged 14 years who had had convulsive seizures since the age of 9 months and adenoma sebaceum at the age of 12 years. Some were interpreted as hyperostotic formations of the internal lamina, others were assumed to be in the brain substance. The need for the use of the pneumoencephalogram in the light of these facts becomes apparent.

ETIOLOGY

Adenoma sebaceum appears to be evidence of a general ectomesodermal disturbance. The retinal tumors are believed by Grinker⁷ probably to be astroblastic neoplasms, and others view them as tumors of low

malignancy. The congenital phacomias arise from the nerve fiber layer appearing as small white or gray tumors. These were noted by van der Hoeve⁸ in his original description as being also present in von Recklinghausen's neurofibromatosis and von Hippel-Landau's disease which emphasizes one of the characteristics common to this group of congenital neurocutaneous syndromes.

In the background of these congenital anomalies, Yakovlev and Guthrie⁹ state, is present an embryonal disturbance of the differentiation of the ectodermal elements. The similarity between tuberous sclerosis, neurofibromatosis and trigeminal nevus (angiomas cerebri) has been ascribed by Schwartz and Abramson¹⁰ on an etiologic basis to the interplay of varying combinations of developmental defects. "Of special interest is the occurrence of eutaneous anomalies which are indicative of associated maldevelopments in deeper seated embryologically related structures such as the central and peripheral nervous systems. Also of importance is the frequent association of the three congenital disorders with mental defect and epilepsy."

COMMENT

The discovery of discrete calcified intracranial deposits renders it incumbent on the observer to incriminate or exclude, in addition to tuberous sclerosis, a number of causes. These may be (1) calcified hemorrhagic foci due to birth injury, (2) tuberculomas, (3) calcified multiple angiomas, (4) parasitic disease (calcified echinococcus cysts), (5) disturbance in calcium metabolism as seen in parathyroid disease, (6) old abscesses as a result of meningeal disease or pachymeningitis.

In the cases reported herewith, the studies served to exclude any of these possibilities. Birth injury was

absent. Tuberculosis was ruled out by a negative history, examination of the chest and cutaneous tests. Stools were clear of ova and parasites. Blood calcium

and phosphorus levels were within normal limits. There was no history of infection or meningeal disease, as well as no roentgen evidence of cystic bone disease. The serologic tests were negative.

The weight of evidence favoring a diagnosis of tuberous sclerosis in case 1 includes the presence of epileptic seizures, mental deficiency, eye changes consisting of congenital degenerative atrophic macular changes, calcified masses in the brain localized to the ventricles with an associated microgyria, familial tendency as shown by the presence of epileptic seizures and similar calcifications located in the region of the father's left ventricle and the further evidence of convulsions and brain tumor in the history of other members of the family.

The absence of the typical cutaneous manifestations (adenoma sebaceum) in both cases in the presence of these observations serves to classify these cases among the abortive forms. A number of cases of tuberous sclerosis have been reported in which evidence of nevus facial eruption was not present. Berkwitz and Rigler¹¹ report a case in which encephalography disclosed multiple tumor-like nodulations in the lateral ventricles with none of the usual evidences of adenoma sebaceum. A case reported by Drake¹² as tuberous sclerosis showed discrete masses of calcifications in the occipital region with bulging of the right thalamus into the lateral ventricle by encephalography, but physical examination revealed neither retinal phacomia or adenoma sebaceum. Heubelm, Pendergrass and Widmann,¹³ who quote Drake's case, concur in his opinion that this clearly represented a case of tuberous sclerosis.

The familial incidence of tuberous sclerosis has been reported by a number of observers. Fabing¹⁴ reported its presence in identical twins, and 5 cases of adenoma sebaceum in one family were cited by Shelmire.¹⁵ As previously noted, a latent form classified by Critchley and Earl includes one of visceral tumor with a family history of tuberous sclerosis.

Our attention to the possible diagnosis was directed by the fact that the father had a convulsion while the son was under our observation. The long interval of years between seizures in the father's history is a helpful diagnostic point, since long remission has been stated by Sherlock¹⁶ and others as differentiating these seizures from those due to idiopathic epilepsy.

In evaluating the evidence presented in these case reports, Pendergrass¹⁷ concurred with us that we were dealing with 2 cases of tuberous sclerosis.

A clear understanding of the nature of these calcifications is a necessary corollary to intelligent treatment. Cortical "scars" have been subjected to operative removal, with reported relief of symptoms. Mayfield,¹⁷ for example, reports the removal of two large irregular areas of calcification from the right premotor area and one from the left premotor area of a male Negro with a manic depressive psychosis who had developed jacksonian epilepsy five years after first coming under his observation. Two years after recovery from the opera-

tion the attacks recurred. No pneumoencephalographic studies were reported in this case. In the light of the preceding considerations it is readily apparent how thorough the search for the etiology of the epileptiform seizures must be before definitive therapeutic procedures are instituted.

SUMMARY AND CONCLUSIONS

1 In the 2 cases of familial multiple cerebral calcifications associated with epileptiform seizures here reported the additional evidence in 1 case of mental deficiency, congenital eye defect, localization of the calcified masses to the lateral ventricles by pneumoencephalography and the presence of calcifications in the other case in the region of the ventricles justifies the diagnosis of tuberous sclerosis (epiloia).

2 The more frequent use of roentgenography and pneumoencephalography is recommended in cases of epilepsy to establish the diagnosis of this neurocutaneous syndrome, even in the absence of adenoma sebaceum.

3 The increasing recognition of this entity will serve more clearly to define its hamartial nature and delimit the diagnosis of idiopathic epilepsy to an ever smaller group.

RENAL GLYCOSURIA IN SELECTEES AND VOLUNTEERS

HARRY BLOTNER, M.D.

BOSTON

AND

MAJOR ROBERT W. HYDE

MEDICAL CORPS, ARMY OF THE UNITED STATES

A study of glycosuria was made on 45,650 consecutive selectees and volunteers aged 18 to 45 years who appeared for final examinations at the Boston Induction Center prior to army induction. The incidence of glycosuria in this group was 0.8 per cent, or 367 cases. The glycosurias were classified into three groups, there were (a) 208 cases of diabetes mellitus, (b) 126 cases of transient glycosuria and (c) 33 cases of renal glycosuria.

Renal glycosuria is regarded as a rare disorder. Joslin and his associates¹ found 62 cases of renal glycosuria, including 9 cases of renal glycosuria of pregnancy, among 18,000 cases of mellituria. Fitz² reported that the compiled records of the Massachusetts General Hospital and Peter Bent Brigham Hospital for the last decade showed the diagnosis of renal diabetes only 36 times. Fowler³ discovered only 7 cases of renal glycosuria among 4,000 cases of mellituria at the Montreal General Hospital, while Wilder⁴ noted 82 cases at the Mayo Clinic. Falta⁵ in Vienna believed the condition was not so uncommon, but a number of cases he reported as renal glycosuria present rather high blood

sugar curves, which we would diagnose mild diabetes mellitus. It was observed more commonly in Scotland by the Peels,⁶ who disclosed 30 cases of renal glycosuria among 115 recruits with mellituria.

In our series of 367 cases of glycosuria, renal glycosuria appeared so frequently that a study of this disease appeared of considerable practical importance.

PLAN OF INVESTIGATION

The men who appeared for final examinations before being inducted into the army were those who did not have gross disqualifying defects detected without instruments, those who were not confined to institutions and who did not have known syphilis. All men had thorough physical and mental examinations, x-ray examinations of the chest and urine examinations. The test for sugar in the urine was made with Benedict's solution. Two drops of urine were placed in 1.5 cc of Benedict's qualitative solution and boiled for five minutes. If the urine was sugar free, the solution remained clear blue; if sugar was present the color varied from an opaque green to brick red, with a precipitate depending on the concentration of sugar in it. The qualitative amounts of sugar in the urine were indicated according to the color by 1+ for green, 2+ for yellow, 3+ for orange and 4+ for brick red. If repeated urine examinations showed sugar and no verified history of diabetes was obtained, the men were sent to an army hospital for sugar tolerance tests. A standard dose of 100 Gm of dextrose was employed and was ingested after the subject had fasted overnight. The concentration of sugar in the blood and urine was determined in specimens taken during fasting and at intervals of one-half, one, two and three hours after the ingestion of the dextrose. The determination of the blood sugar was made on 2 cc samples of venous blood according to the method of Folin and Wu.⁷ Here the test for sugar in the urine was made with 8 drops of urine in 5 cc of Benedict's qualitative solution. In addition, various other studies were made on certain clinical features of the disease.

RESULTS

The diagnosis of renal glycosuria was made when the subject had a normal blood sugar curve and specimens of urine contained varying amounts of sugar after the ingestion of 100 Gm of dextrose. Some of the fasting urine specimens were recorded as sugar free at times. Typical examples of these cases are shown in the accompanying chart. In 20 of these cases the peak of the blood sugar curve was below 140 mg per hundred cubic centimeters, in 4 cases the maximum rise was 150 mg per hundred cubic centimeters and in 9 cases the maximum level was approximately 160 mg per hundred cubic centimeters after the ingestion of the standard dose of the dextrose.

Glycosuria occurred in all cases at a blood sugar level of 110 mg per hundred cubic centimeters or less and in some cases the level was as low as 75 mg per hundred cubic centimeters. Although some authors define renal glycosuria as a persistent glycosuria with normal blood sugar curves, we considered our criteria satisfactory.

The difference in our results and theirs appeared too great to be explained simply on the basis of the variation in the diagnostic criteria. However, it was interesting that our investigation and that of the Peels were made on recruits with mellituria and in both of these there was a high incidence of renal glycosuria.

CLINICAL FEATURES

Age—Renal glycosuria may be recognized at any period from infancy to old age. However, the age of the persons in our group was of considerable interest because renal glycosuria occurred predominantly in the younger selectees in contrast to true diabetes, which appears chiefly in the older persons. Twenty-three, or 70 per cent, of the men were 20 to 29 years of age, while 10, or 30 per cent, were 31 to 44 years of age, as shown in table 1. In comparison approximately 59 per cent of the men examined here were 20 to 30 years old, while 41 per cent were 31 to 45.

Family History of Diabetes—The familial incidence of this type of glycosuria has been pointed out by a number of writers, such as Brown and Polshuck.⁸ Twenty-two persons with renal glycosuria were questioned concerning their family history of diabetes. Of these, 7 persons, or 32 per cent, gave a family history

Illustrations of sugar tolerance results obtained in renal diabetes following the ingestion of 100 Gm of dextrose. A represents 13 cases B 11 cases and C 9 cases

of diabetes, which appeared in only 1 member of the family in all instances. It is not known whether the familial cases were true diabetes or renal glycosuria, since the history was based on the person's statements. Although this group is small the findings appear significant when compared with that of a control group. In the controls 2,293 consecutive nondiabetic selectees were interviewed and 119 persons, or 5.2 per cent, gave a family history of diabetes, which occurred in all cases in 1 member of the family.

Occupation—The occupation was studied in 22 cases of renal glycosuria. In 15 cases the work was laborious with such occupations as machinists, truck helper, sheet metal worker, pipe fitter, carpenter, welder and day laborer. In 7 cases there were sedentary occupations as salesman, timekeeper, shoe dealer, taxi driver and 3 clerks. These men had lived in the rural as well as the urban districts.

Marital State—The marital state was known in 21 cases. Sixteen persons were single, 4 were married and 1 was separated.

Nationality—The nationality or racial origin of these 33 men was studied. The racial origin as ascertained in 20 instances in which the parents were foreign born was 7 Irish, 2 French, 2 German, 2 Jewish, 1 Italian, 1 Greek, 1 Portuguese, 1 African, 1 Scotch and 2 of

doubtful extraction. Some of these men were not born in this country. The other 13 persons came from families who had been in this country for a number of generations.

Symptoms—None of these men had any symptoms related to the glycosuria. In fact they were physically a very healthy group with no complaints. The blood pressures were normal except in 1 case, in which it was 170/110. The known duration of the glycosuria was of interest because 31 of the 33 men never knew they had the disorder before this examination. Two youths aged 21 and 22 had sugar in the urine, which was found on routine examinations five and two years before respectively.

Height and Weight—The heights of these men ranged from 62 to 74 inches (157.5 to 188 cm) and the weights from 113 to 229 pounds (51 to 104 Kg). The average height without shoes was 68 inches (173 cm). This measurement did not differ significantly from the average height with shoes for males of 68¼ inches (173 cm) based on insurance data.⁹ They appeared to have a normal distribution in regard to

TABLE 1—*Age of Thirty-Three Patients with Renal Glycosuria*

21	1

TABLE 2—*Status of Height of Thirty-Three Persons with Renal Glycosuria*

Number of Cases	Weight According to Height and Age—Army Standard ¹⁰
12	7 to 11 pounds underweight
5	22 to 33 pounds underweight
14	Normal weight
2	13 to 61 pounds overweight

height, and most of them were between 66 and 70 inches (168 and 178 cm) tall.

In contrast to diabetic patients who are generally overweight, persons with renal glycosuria in this group were usually of normal or subnormal weight according to army standards¹⁰ as shown in table 2. One half of them were 7 to 33 pounds (3 to 15 Kg) underweight, while 14 were of normal weight. Weights which usually ranged from 3 pounds (1.3 Kg) below to 7 pounds (3.2 Kg) above the army standards for height and age were called normal. Two men were 43 to 64 pounds (19.5 to 29 Kg) over the standard weight, although they were only 8 to 26 pounds (3.6 to 12 Kg) above the maximum standard. Their heights were 74 and 70½ inches (188 and 178 cm) and weights 216 and 229 pounds (98 and 104 Kg) respectively. In a further control study the weight according to height of 1,000 consecutive selectees was compared with the army standards and was found to be almost identical with them. There was no definite history of weight loss.

X-Ray Examinations of Lungs—X-ray examinations of lungs were made in all these cases of renal glycosuria

and in no case was there any active tuberculosis. The results were entirely normal in 32 cases. In 1 case there was a healed primary complex of the left lung.

COMMENT

Renal glycosuria is considered to be a rare condition even among the general run of cases of mellituria. In this study there was the high incidence of 33 cases of this disorder as proved by sugar tolerance tests in 367 consecutive persons with glycosuria between the ages of 18 to 45 years, as compared with the low incidence in the experience of others. It was unusual to find such a large percentage of these cases, although the Peels obtained similar results in recruits. In other words there was 1 case of renal glycosuria in approximately every 11 persons who showed sugar in the urine at this induction center. This finding is of great practical importance in the management of glycosurias from the point of view of diagnosis, treatment and prognosis. There are many people with glycosuria who are treated for diabetes mellitus without having had blood sugar determinations or sugar tolerance tests. If our results could be applied to the general population between the ages of 18 to 45 years it would mean that many patients with glycosuria are being treated needlessly for diabetes mellitus when they may be having renal glycosuria. This is important because diabetic treatment in renal glycosuria has been considered unnecessary since the restriction of carbohydrate in the usual diabetic diet has no appreciable effect on renal glycosuria. Perhaps, with the loss of sugar in the urine, patients with renal glycosuria who are especially underweight should have an increased amount of carbohydrate in the diet. On the other hand, they should have prolonged and periodic observations particularly because of the strong history of diabetes in these cases.

The prognosis is good with normal life expectancy, although the condition appears to be chronic without symptoms. The disease apparently does not progress to diabetes mellitus according to Joslin and his associates,¹¹ Fitz and Wilder.⁴ In their large experience they have never seen a case of renal glycosuria in which true diabetes developed, although it has been suggested by others. The pathology of renal glycosuria is not known because no autopsy in such a case has been reported. However, there is evidence of a physiologic defect in the renal tubules. Friedman and his associates¹¹ studied the renal blood flow, glomerular filtration rate and the degree of tubular reabsorption of dextrose in renal glycosuria using the diodrast and inulin clearance tests. They found the effective renal blood flow and glomerular filtration to be normal in renal glycosuria. On the other hand, they noted a diminished tubular reabsorption of dextrose in renal glycosuria which did not appear to be due to any organic kidney defect, for at plasma dextrose levels above 200 mg per hundred cubic centimeters the efficiency of tubular reabsorption of dextrose in these cases equaled or exceeded that found in nonglycosuric persons.

SUMMARY

A study was made of 33 cases of renal glycosuria which occurred in 367 cases of mellituria found in 45,650 consecutive men aged 18 to 45 years who appeared for final examination at the Boston Induction Station.

⁹ Medical Impairment Study, Actuarial Society of America and Association of Life Insurance Medical Directors, New York, 1929, p. 138.
¹⁰ Army Regulations No. 40 105, War Department, Washington, D. C., Oct. 14, 1942.

¹¹ Friedman, Meyer, Selzer, Arthur, Sugarman, Jerome and Sauer, Maurice. The Renal Blood Flow, Glomerular Filtration Rate and Degree of Tubular Reabsorption of Glucose in Renal Glycosuria, *Am. J. Med.* 20:4 22 (July) 1942.

Renal glycosuria appeared predominantly in the younger subjects 23 being 20 to 29 years of age, while 10 were 31 to 44 years of age. A family history of diabetes was obtained in 32 per cent of those questioned on this point in contrast to 52 per cent in a nondiabetic group. The occupations of most of these men were of a laborious nature.

There were no symptoms referable to the disease. In all of these cases, renal glycosuria was found on routine examinations. The average heights were normal whereas in all but 2 cases the weights were either normal or subnormal.

The finding of 1 person with renal glycosuria in approximately every 11 with mellituria here was unusual and important from the standpoint of diagnosis, treatment and prognosis. It is urged that all persons with glycosuria have sugar tolerance tests or nonfasting blood sugar determinations made in order to rule out renal glycosuria because diabetic treatment has been considered unnecessary in this condition. Nevertheless, persons with renal glycosuria deserve periodic and prolonged observations especially because of the strong family history of diabetes in these cases.

Our observations strongly suggest that renal glycosuria is a symptomless, not uncommon clinical entity which may follow a definite pattern as to age and weight and merits more extensive study.

Clinical Notes, Suggestions and New Instruments

LEWISITE BURNS OF THE EYE

DAVID G. COGAN, M.D., BOSTON

It is generally presumed that much of the incapacitation resulting from exposure to lewisite will be due to lesions of the eye, as has been the case with mustard gas. Because of the importance of this subject at the present time and the apparent absence of similar case reports previously, 2 instances are described in which ocular lesions occurred following exposure to lewisite under field conditions.

EXPOSURE AND INCIDENCE

The exposure occurred in the early afternoon in mid-January. The temperature was 25 F. and there was considerable wind. An ampule containing 100 cc of 5 per cent lewisite in chloroform was exploded at a distance subsequently measured as 50 to 80 feet from a group of 33 observers in an open field. The observers were standing down wind to the explosion. Within a few minutes after the explosion pieces of indicator paper which the observers were holding in their hands were said to have shown droplets indicating the presence of liquid lewisite.

Of the 33 in the group 19 developed cutaneous lesions and 2 ocular lesions. 10 noted lacrimation.

REPORT OF CASES SHOWING OCULAR LESIONS

CASE 1.—L. D. a man aged 46 with no antecedent ocular disease and no previous exposure to lewisite or mustard gas complained of severe burning of the eyes and involuntary spasm of the lids within a few seconds after the explosion. Epiphora was prompt and copious, the tears wetting the collar. No odor was detected.¹ Owing to the irritant nature of the gas

the patient believed that he was being exposed to tear gas and therefore did not apply for treatment for ten minutes. At this time both eyes were washed copiously (two minutes to each eye, repeated two or three times) with water from a drinking fountain, followed by a single irrigation of sodium bicarbonate solution. The latter is said to have decreased the discomfort. However a fairly severe foreign body and burning sensation with attendant epiphora and blepharospasm persisted for approximately twelve hours. The symptoms were most severe within a few minutes after the exposure.

Examination ten hours after the explosion showed a diffuse papular eruption of the forehead, eyelids and cheeks. The ocular manifestations were similar in the two eyes. The lids were moderately edematous. The conjunctivas were not edematous but the pericorneal vessels were dilated producing a violaceous flush over the ciliary region. There were six or seven separate lesions in the lower halves of both corneas. These were all superficial and appeared with the biomicroscope to be limited to the epithelium. The larger two formed branched lines about 1 mm in length (similar to lesions in early dendritic keratitis). The smaller lesions consisted of numerous gray dots producing a picture of keratitis epithelialis. There was no extensive loss of epithelium but all lesions stained locally with fluorescein. Neither infiltrates nor epithelial edema was detectable except immediately adjacent to the dendritiform lesions. Corneal sensitivity as determined with a wisp of cotton was normal. The anterior chambers were clear and no evidence of iritis was present. The fundi were normal.

Five per cent sulfadiazine ointment was placed in both eyes once. The patient was again examined twenty-three hours after the initial exposure. Subjectively the eyes were considerably improved. The edema of the lids and the dilatation of ciliary blood vessels were less noticeable. The corneal lesions showed no change that was apparent with the biomicroscope and still stained with fluorescein. The eruption of the face was less pronounced and caused less subjective burning than previously.

The patient was not further treated. He was again examined forty-eight hours after the initial exposure. Symptomatically he was entirely well. The eyes were grossly normal. With the biomicroscope a faint haze could be seen in the superficial stroma corresponding to the former dendritiform lesions but there was no staining with fluorescein. Two weeks later the patient reported that he had had no recurrence of symptoms.

CASE 2.—B. A. a man aged 34 had no antecedent ocular disease and no previous exposure to lewisite or mustard gas. As in case 1 a sensation of severe burning spasm of the lids and lacrimation occurred within a few seconds after the release of the gas. No odor was detected¹ and the patient believed the irritant to be tear gas. About ten minutes after the exposure the eyes were irrigated several times with water. Except during and immediately after the exposure the only symptoms were occasional foreign body sensation and slight blurring of vision with the right eye.

Examination ten hours after the explosion showed a diffuse papular eruption of the forehead. The lids of the right eye were slightly edematous and those of the left normal. The pericorneal vessels on the right were slightly dilated. In the pupillary area of the right eye there was a superficial linear opacity about 2 mm in length which was seen with the biomicroscope to be made up of thirty to fifty tiny white dots. These dots stained individually with fluorescein. Epithelial edema was not noted. Corneal sensitivity was normal. The left eye was entirely normal. The right eye was treated with a single instillation of 5 per cent sulfadiazine ointment.

When reexamined twenty-three hours after the initial exposure the edema of the lids had disappeared. The patient was asymptomatic. The appearance of the corneal lesion had not changed and still stained with fluorescein. The patient was not examined again but two weeks later reported that he had had no further symptoms.

COMMENT

The ocular effects in these 2 cases are of interest in comparison with lesions known to have occurred from mustard gas. Lewisite and mustard gas are the two chemicals which

From the Howe Laboratory of Ophthalmology, Harvard Medical School. Approved for publication by Milton C. Winternitz, M.D., Chairman of the Committee on the Treatment of Gas Casualties.

¹ Others in the group are said to have detected the characteristic odor of lewisite.

as far as information is available, are likely to be used in the present war, and both are notoriously toxic to the eye under laboratory conditions. Judging from observations limited to these 2 cases, the most striking difference between lewisite and mustard gas in man is the time after the exposure at which the symptoms occur and the protective reflexes become operative. With a concentration of mustard gas comparable to that of lewisite in the exposures reported, no symptoms occur for several hours after the exposure, while in the case of lewisite irritation is practically immediate. Indeed, both patients believed that they were being exposed to tear gas. This difference may well be of major importance. Owing to its nonirritative nature, mustard gas may be absorbed into the corner over a considerable time, resulting in a cumulative effect. Lewisite on the other hand, elicits prompt irrigation by tearing, lessening or further contact by blepharospasm and, most important, the painful awareness of noxae in the eye. It seems altogether likely that this difference in reaction accounts in large measure for the apparent difference in severity of the ocular manifestations resulting from the exposure to the two gases.

SUMMARY AND CONCLUSIONS

1. In 2 instances of ocular lesions in man resulting from exposure to lewisite droplets and gas the chief manifestations were in the superficial corner and resulted in no permanent damage.

2. An important difference between exposure to lewisite and mustard gas in man is the fact that one is promptly irritating and evokes prompt protective reflexes, while the other does not.

3. This difference would seem to account for the relative mildness of the ocular lesions from lewisite in the foregoing instances.

243 Charles Street

NAIL POLISH DERMATITIS

W. H. GUY, M.D. AND I. M. JACOB, M.D., PITTSBURGH

Because of an apparent increased incidence of nail polish dermatitis and because the condition is so frequently not recognized, we venture again to call it to the attention of the profession.

Within a period of twenty-three days recently we have seen 25 cases. None of these had been recognized. The condition varied in duration from a few days to several months. A representative percentage of the group of patients had been under dietary and other internal forms of treatment, including that directed toward "acidity." The majority of these patients presented a simple dermatitis with edema of the eyelids associated with a dermatitis of varying severity involving the neck. Several presented areas of dermatitis over the shoulders where contact was made in the adjusting of shoulder straps. The patches developed on the thighs where contact was made by the patient pulling down her girdle while dressing. Two instances were noted on the legs below the knees where liquid nail polish had been applied to stop runners in stockings. One patient had a patch of dermatitis on the forearm where contact was made by flexion with a patch test above the elbow.

Both colored and clear polishes were found to be at fault, but naturally most outbreaks were traced to the tinted brands. Seven different manufacturers were represented, and the very expensive brands were quite as frequently at fault as the cheaper ones. One representative manufacturer assured us that attempts to identify and eliminate the offending fraction would not be practical at present because of the extreme variation in composition of different lots of basic materials.

All cases were proved by patch tests. It was frequently difficult to convince patients of the source of their trouble, and they were loath to eliminate liquid nail polish. It seems advisable to point out that we frequently found it necessary to continue the patch tests for several days to produce a positive reaction. All cases cleared promptly following discontinuance of liquid nail polish and the application of soothing agents.

AN IMPROVED "FIELD" POTAIN ASPIRATOR

MAJOR DAVID BALL
MEDICAL CORPS, ARMY OF THE UNITED STATES

Actual field conditions in the Army of the United States often demand the improvisation of an apparatus that ordinarily is found on the shelf of any surgical supply store on the home front.

Shortly after we set up a tent hospital in the field "somewhere in Persia," a patient with a large pleural effusion was admitted. The clinical diagnosis was confirmed by an x-ray examination of the chest, which revealed a large left pleural effusion with displacement of the heart to the right. Only part of our equipment had as yet arrived, no Potain or other aspirating set was available and there were no glass Y or T tubes with which to make a set.

It occurred to me that a closed system aspirator might be made, utilizing rubber tubing, a pinch clamp, a syringe and a Murphy type intravenous drip tube. This material had just been made available from the set accompanying human plasma given to a patient in shock.

Improved "field" Potain aspirator. A, syringe; B, pinch clamp; C, Murphy type intravenous drip tube; D, hole in tube; E, needle; F, rubber tubing.

The apparatus was set up as illustrated in the diagram. With the pinch clamp B closed, the needle E is inserted into the pleural cavity. The finger of the operator then is held over the hole D in the Murphy drip tube C, the pinch clamp B opened and an assistant withdraws the barrel of the syringe A, thus filling the system and syringe with fluid from the pleural cavity. When the barrel of the syringe is full, the operator closes the pinch clamp B, removes his finger from the hole D in the drip tube and the assistant pushes down on the plunger of the syringe, thus forcing the aspirated fluid through the hole in the drip tube into a collecting basin. This process is repeated until the fluid is aspirated from the pleural cavity.

In the case in question, 1,675 cc of fluid was removed with ease in no more time than is ordinarily taken with a standard apparatus. An x-ray examination of the chest after the procedure did not reveal the presence of any air in the pleural cavity and most of the fluid had been removed.

The material necessary to make the apparatus is usually available in the smallest hamlet or with any field medical corps.

Special Article

HANDBOOK OF NUTRITION XVI

IMPROVING THE QUALITY OF CHEAP STAPLE FOODS

GEORGE R. COWGILL, PH.D.
NEW HAVEN, CONN.

These special articles on foods and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition.—Ed

Discoveries in the science of nutrition over the past three decades have made it possible to state more exactly than ever before the many specific factors that are essential for satisfactory nutrition. A brief classification of them would include food energy, the protein factor, essential fatty acids, indispensable mineral nutrients and the vitamins. An attempt to list individually all the substances required gives a total of approximately forty, the exact number depending on whether the claims for the existence of certain factors are to be accepted or not. In view of this new knowledge it is obvious that foods can now be evaluated in a manner much more precise and specific than was ever possible before. These recent discoveries have also included the isolation and finally synthesis on a commercial scale of several of the vitamins, thus making it possible to add these factors to foods. Such possibilities have naturally received the attention of both the food industry and students of nutrition and public health. On the industrial side it has been necessary to solve many technological problems. Nutritionists, clinicians and governmental agencies faced with these possibilities have naturally interested themselves in the formulation of principles to be followed in such addition of special factors to foods, amounts to be added and related topics.

The application of these new discoveries can of course result in the production of new foods that would doubtless be classified for some time at least as novelties or specialties because of their relatively high cost and only slight use by the mass of the population. In contrast to this, and much more important for public health and preventive medicine, is the application that means definite improvement in the quality of cheap staple foods that occupy prominent places in the dietary. To the extent that these staples, already endowed with a high consumer appeal and acceptance, can be nutritionally improved the chances of incidence of diseases that represent dietary shortcomings can be reduced and the cause of public health thus advanced. This article deals with the latter possibility.

THE GRAINS

Discussions of the foods that figure prominently in various dietaries throughout the world, therefore staple foods,¹ usually deal with them in terms of their contribution to the energy needs of the population. The cheapest source of food energy in the diets used

throughout the world is the cereal grains. In the United States the two cheapest sources of calories are cereal products and cane sugar. In southern China and certain other parts of the Orient rice is the most economical and readily available food and therefore the most widely used cereal. From the standpoint of worldwide use rice comes first, this cereal is eaten by more people than any other member of the cereal grain group. The dominant cereal used as human food in the United States is wheat.

The greater keeping qualities of milled cereals in contrast to the whole grain, together with the exigencies of modern civilized life such as ease of transportation over long distances, has resulted in some degree of milling of the grain becoming the established custom, a practice which, from the standpoint of nutritive value of the material, means loss in corresponding degree. It is not surprising, therefore, that the addition of essential vitamins and minerals to milled cereal products, wheat flour for example, should have received serious

TABLE 1—Current Standards for Enrichment and Fortification of Foods

Enriched White Flour ² (Required)	
Thiamine	From 1.66 to 2.5 mg per pound
Riboflavin	From 1.2 to 1.8 mg per pound
Nicotinic acid (niacin) or its amide	From 6 to 24 mg per pound
Iron	From 6 to 24 mg per pound
Enriched White Flour (Optional)	
Vitamin D	From 250 to 1000 U S P units per pound
Calcium	From 500 to 2000 mg per pound
Wheat germ	Not more than 5 per cent
Oleomargarine Fortified with Vitamin A (Federal Register 6 27(1) (June 7) 1941)	
Not less than 9000 U S P units of vitamin A per pound	
Milk Fortified with Vitamin D	
Council on Foods and Nutrition of A M A approves milk containing from 135 to 400 U S P units per fluid quart or reconstituted quart	
Iodized Table Salt	
Council on Foods and Nutrition of A M A accepts salt containing 0.01 per cent of potassium iodide or equivalent of sodium iodide provided distribution of the iodide in the salt is uniform and this concentration is present after storage under ordinary conditions. Food and Nutrition Board of National Research Council also has approved of this standard.	

attention as one of the new possibilities for application of modern nutritional knowledge in the interest of preventive medicine.²

Interest in this possibility of improving the nutritive value of wheat flour has finally resulted in the establishment by the Food and Drug Administration of the federal government of standards for enriched flour.³ The substances and amounts to be added in making this product are given in table 1. Current standards for enrichment or fortification of other foods are also given in this table.

Enforcement of the regulation with respect to enrichment of flour with riboflavin has been delayed because of shortage of this vitamin owing to lack of satisfactory methods for production of it on an industrial scale. Until this problem has been solved, riboflavin will be too expensive and difficult to secure to warrant making

its addition compulsory. Progress toward solution of this problem has been made, however.⁴

Discussion of this "enrichment" or fortification problem has brought out many suggestions of principles and facts to be considered when making additions of vitamins and minerals to foods.⁵ It is pertinent to inquire whether a lack of the dietary essential in question in the ordinary diet of the people is sufficiently widespread to justify the proposed addition of it to appropriate foods. If no real need for such addition can be shown, one may well question the wisdom of it as a socially planned and directed move; its direct justification then becomes a commercial one dependent for its success almost entirely on advertising and other promotional activities of units of the food industry.

If there are reasonable grounds for believing that a serious deficiency of the dietary factor of interest does exist, the question arises as to the most suitable food to be "enriched" or fortified with it. There may be rather general agreement as to the class of food to be enriched, but it does not necessarily follow that all products in this class should be so treated. As an example of this situation consider macaroni, which is

may now be cited. Students of nutrition have long agreed with Sherman that there is a real likelihood of a significant deficiency of calcium, and therefore there is justification for promoting wider use of calcium rich foods like milk, milk products and green leafy vegetables. There are also reasons for believing that the American diet is not as rich in thiamine as it should be. The testimony offered in the hearings held by the Food and Drug Administration which resulted in the federal standards for enriched flour supported the view that the average American dietary does not furnish amounts of some essential vitamins and minerals sufficient to insure the public health. On the basis of the evidence they have summarized concerning the existence of malnutrition in our population, Jolliffe, McLester and Sherman⁶ believe that such malnutrition is sufficiently widespread to justify taking measures to obviate it.

VITAMINS AND MINERALS

In 1939 the Council on Foods and Nutrition of the American Medical Association considered this general question of the addition of vitamins and minerals to foods and adopted the following statement as an expression of its policy:

The Council on Foods desires to encourage the restorative addition of vitamins or minerals or other dietary essential, in such amounts as will raise the content of vitamin or mineral or other dietary essential of general purpose foods to recognized high natural levels, with the provision that such additions are to be limited to vitamins or minerals or other dietary essentials, *for which a wider distribution is considered by the Council to be in the interest of the public health.*⁶

The words that I have italicized are particularly pertinent here because they state an important limitation which not only the Council has adopted, when expressing its approval of such additions, but the Committee on Food and Nutrition (now Food and Nutrition Board) of the National Research Council as well.

In its approach to this problem the Council on Foods and Nutrition of the American Medical Association deemed it advisable to express the limitations of additions of various factors to general purpose foods in terms of milligrams per hundred calories and established such limitations with respect to calcium, iron, thiamine, riboflavin and niacin. The values are presented in table 2.

The Committee on Food and Nutrition of the National Research Council expressed its views on this question in the following resolution:

WHEREAS, There exist deficiencies of vitamins and minerals in the diets of significant segments of the population of the United States which cannot promptly be corrected by public education in the proper choices of foods, be it resolved in order to correct and prevent such deficiencies:

1 That the Committee endorses the addition of specific nutrients to staple foods (as indicated under 6 below) which are effective vehicles for correcting the above deficiencies in the diets of the general population, or of significant advantage of geographic, economic or racial segments thereof,

2 That the Committee opposes the inclusion of additions of specific nutrients under definitions and standards which may be promulgated under the Food, Drug and Cosmetic Act except in the case of foods which constitute such effective vehicles of distribution,

TABLE 2—Important Food Values of Natural Grains and Upper Limits of 'Restoration' for General Purpose Cereal Foods

Product	Ca	Fe	Thia	Ribo	Niacin
	Mg. per 100 Calories	Mg. per 100 Calories	Mg. per 100 Calories	Mg. per 100 Calories	Mg. per 100 Calories
Restored cereal	75	1.5	0.25	0.10	
Cornmeal	7.2	0.9	0.05	0.05	0.4
Oatmeal	56	1.2	0.21	0.05	0.4
Whole wheat flour	115	1.4	0.11	0.07	1.5

made largely of wheat flour. Macaroni is always boiled when being prepared for the table, and tests have shown that such handling results in loss of roughly 50 per cent of added vitamin B₁. Therefore, even if the pure vitamin can be obtained at practically negligible cost, so that relatively large amounts more than sufficient to offset such loss can be added, one may well question the practicality of its addition to macaroni. As another example one may consider the fortification of lard with vitamin A. Since this animal fat is widely used in cooking and such use results in appreciable loss of the vitamin, a conservative attitude toward the question of the addition of vitamin A to lard is justified. In the light of these two illustrations it is obvious that a body of facts regarding the need for various dietary essentials and the probable supply in common foods is required, as well as information of the technological sort concerning the feasibility of the proposed addition to any given food product before approval should be given any specific proposal of enrichment or fortification.

Concerning this question of need for particular dietary factors by the American people, numerous papers

⁶ Annual Meeting of the Council on Food, J. A. M. A. 113 (Aug. 19) 1939.

3 That the Committee favors unequivocally the fulfillment of the nutritional needs of the people by the use of natural foods as far as practicable and to that end encourages education in the proper choice of foods and the betterment of processes of food manufacturing and preparation so as to more fully retain the essential nutrients needed thereto,

4 That, to avoid undue artificiality of food the Committee favors, whenever practicable the choice, as vehicles for the corrective distribution of vitamins and minerals, of those foods which have suffered loss in refining processes and recommends that the vitamins and minerals added to such foods should preferably be the kinds and quantities native therein in the unrefined state

5 That the addition of other than natural levels of vitamins and minerals to foods which are suitable as vehicles of distribution may be sanctioned when more natural routes are practically unavailable as ways to correct known nutritional deficiencies

6 That at present the Committee favors appropriate enrichment of flour and bread (and perhaps corn meal), the fortification of milk with vitamin D the suitable addition of vitamin A to table fats and of iodine to salt for dietary use There is no information available to the Committee at the present time which indicates that it is desirable for the Committee to recommend the addition of vitamins or minerals to foods other than those named

7 That specifically the Committee opposes the addition of synthetic vitamins to carbonated beverages and confectionery

From the statement quoted it is evident that the idea of adding vitamins and minerals or other dietary essentials to foods has been accepted sufficiently to secure official sanction in the following cases: the appropriate enrichment of flour and bread (and perhaps other cereal products) with several factors, the fortification of milk with vitamin D of table fats with vitamin A, and of table salt with iodine To what extent other additions will finally acquire widespread acceptance and then official approval only time and the accumulation of new data can determine

When it has been agreed that certain dietary essentials may well be added to particular foods or classes of foods the question arises as to how much should be added The discussion of this problem has been most interesting to follow It has been argued that a worthwhile principle to apply is that of restoration of the milled or processed food by appropriate addition of dietary factors to give a product approximating the natural food source, whole wheat flour for example as contrasted with highly milled white flour This has been called the principle of restoration Paragraph 4 of the statement of the National Research Council Committee is based on this idea of "restoration" of the milled product to something comparable to the natural one

When a single dietary factor is being considered, this principle has much to commend it For example, the processing of a fruit juice may result in appreciable loss of vitamin C, and products of this sort are normally very valuable as sources of this factor The addition of ascorbic acid in amount sufficient to "restore" this particular processed juice to approximately the highest concentration characteristic of the natural juice would seem justifiable The principle of restoration proves to be unsatisfactory, however, when the addition of more than one factor is being considered In the case of ordinary wheat flour, for example, the addition of

vitamin B₁ in amount sufficient to make the flour approximately equal to whole wheat with highest natural concentration means a significant addition of the restorative sort, a restorative addition of riboflavin (vitamin B₂) to the flour, however, means very little because the cereal grains are not good natural sources of this factor It therefore riboflavin is nevertheless to be added to the flour in significant amounts the addition means "fortification" because the enriched product will contain even more riboflavin than is found in the natural whole grain

When several dietary factors are being added to a given staple food, some in accordance with the principle of restoration others in accordance with fortification, one is not limiting oneself to making the staple processed food as nearly as possible like the natural source but frankly modifying it to make an entirely new product to meet a particular nutritive situation Enriched flour is the prime example of this In such a case it is evident that the proposed addition of several factors is best made in some relation to the human requirement for them, taking into account the other

TABLE 3—Thiamine Content of Cereal Grains and Types of Wheat

Milligrams per Pound *

Kind of Grain	Thiamine	Type of Wheat	Thiamine
Oats	2.20-4.50	Durum	2.10-3.50
Wheat	1.45-3.50	Hard spring	1.45-3.49
Barky	2.25-3.33	Hard winter	1.58-71
Corn	1.85-3.04	Pacific	1.71-4.44
Rye	1.55-2.75	Soft red	1.0-2.55

* Original data from Taylor who comments as follows: The foregoing analyses of pure varieties and nondescript (more than random samples) commercial grades and ungraded from good and poor crop stored for short and longer periods with different methods of drying. The significance spreads cannot be as wide as those given.

sources of supply available in the dietary and other pertinent considerations It may be questioned whether there are very many staple foods that lend themselves as suitable vehicles for the wider distribution and intake of several dietary factors instead of only one or perhaps two In view of this there may still be a place for operation of the principle of restoration in the improvement of numerous processed foods

OTHER METHODS OF IMPROVING FOODS

The foregoing discussion has dealt with the ideas that have been advanced for improving staple foods by what might be called the artificial addition of dietary factors lost as a part of food processing There are other ways of achieving the same objective that should be mentioned One may select plant varieties on the basis of genetic constitution and vitamin content It is known that varieties of wheat and other cereals differ considerably in their respective contents of thiamine Data bearing on this topic have been summarized by Taylor and are shown in table 3 In addition to illustrating the variation in thiamine content characteristic of cereal grains the data in table 3 emphasize a point frequently forgotten by those who argue that enrichment of flour is unnecessary, that the use of whole

7 Taylor, A. E. Why Enrichment of Flour? Wheat Studies of the Food Research Institute, Stanford University 18:77-113 (N) 1941 See particularly page 92

grain flour is the answer to the basic problem being attacked. There is no such thing as a standard whole wheat flour with respect to "high natural level" of thiamine content. The adoption and wide use of a standardized enriched flour in contrast to a nondescript unstandardized whole wheat product has therefore some definite points in its favor.

Some staple foods of plant origin can be nutritively improved by the adoption of special methods of cultivation. At the present time we do not know all that we should like to know about the effects of various environmental factors on the vitamin and mineral content of important plants that we use as food. The subject is being actively investigated.⁸ Exposure to sunlight, supply of special materials in the soil, water supply and similar factors require investigation. A food like the potato which remains in the soil until harvested, is known to reflect in its iodine content the iodine concentration of the soil and water.⁹ In an iodine survey of various sections of the state of South Carolina the iodine content of potatoes grown in the respective areas proved to be as good a criterion of iodine supply as analyses of water and soil. In dealing with a shortage of dietary iodine, obviously, then, one has several possibilities: namely (a) wider use of sea food, which is an excellent natural source of this element; (b) wide use of a root vegetable like the potato cultivated in an iodine enriched soil or water; or (c) the fortification with iodine of a product such as table salt. The first two of these possibilities are impracticable for an inland area for obvious reasons; yet valuable procedures in coastal regions, the inland area situation is more easily met by the use of iodized table salt.

Nutritive improvement of foods of animal origin like milk and its derivatives can be achieved in accordance with much the same principles. Milk is such a valuable food that nutritive improvement of it has not had very extensive consideration. Most of the discussion of this topic has centered around the use of fortified milk as a means of increasing the supply of vitamin D to growing children and thus improving the utilization of its calcium. Vitamin D milk may be obtained by direct addition to the milk of a concentrate of the vitamin, with such products differing merely in the source of the concentrate added, such a milk is obviously a "fortified" one. Vitamin D may also be added to the milk through the metabolism of the cow by feeding a product like irradiated yeast, which contains the vitamin. This amounts to affecting the environment in which the milk is produced.

The addition of vitamin A to milk or its fat derivative butter has received some attention. The vitamin A content of butter is known to vary with the season, being low in winter and high in summer.¹⁰ The development

of a butter more uniform in vitamin A content is a worthy objective of the butter industry that has apparently had less attention than it deserves, such a product would be the logical one with which to meet the competition offered by vitaminized oleomargarine. Vitamin A concentrates could of course be added to winter butter. In view of recent experiments by Deuel and his associates,¹¹ there is presented the possibility of significantly enriching cow's milk with vitamin A by feeding certain extremely concentrated preparations of the vitamin. Improved feeding of cows during the winter season constitutes another approach to solution of this question.

From this brief discussion it should be evident that by improving the quality of cheap staple foods it is possible to affect the public health in many important ways. The success which attends this method will obviously depend on several factors. One is the extent to which the consumer is made aware of the values of the improved product when it is in the market competing with the older unimproved but accepted food. The solution of this problem lies in consumer education, and in this work the physician can do much because of his influential position in the community. If the improved product can be given a favored status of some sort, its use will of course be increased. South Carolina and Louisiana have passed laws requiring all white flour sold in their respective domains to be of the enriched variety. Louisiana has also passed a law requiring that all oleomargarine offered for sale contain vitamin A. It is possible that still other states will follow the lead of South Carolina and Louisiana in these respects. This way of achieving greater consumption of a desired product has certain shortcomings as well as advantages. In the case of enriched flour used in these Southern states the advantages are believed greatly to outweigh the disadvantages, because in enriching its flour the milling industry has tended to enrich only the more expensive brands, it is especially important that the enriched flour be used extensively by the lower income groups of the population who have the least money to pay for the improved product. It is to the credit of the milling industry that it has sought to bring about by voluntary means the enrichment of all its staple flour by every unit of the industry. The enactment of laws to solve problems always poses of course some additional problems of effective enforcement and the like, whether a law will be readily accepted, no matter how desirable it may be from a strictly scientific point of view, depends on a sufficient number of the people being properly informed and convinced of its value. Thus we are brought around once more to the fact that the fundamental solution of our basic problem lies in effective education of the general public with respect to the principles of nutrition, food values and related topics. Given the proper education in these matters, the general public will naturally prefer more and more the improved staple foods over those that are not improved, the extent to which this occurs will very largely determine the role that this particular application of modern knowledge in nutrition plays in promoting the public health.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS COMFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

ALVIN E. SMITH, M.D., Secretary

DIETHYLSTILBESTROL (See the Supplement to New and Nonofficial Remedies, 1942, p. 20)

The following dosage forms have been accepted

JOHN WYETH & BROTHER, INC., PHILADELPHIA

Ampoules Diethylstilbestrol (in corn oil), 0.5 mg per cc 1 cc

Ampoules Diethylstilbestrol (in corn oil), 10 mg per cc 1 cc

Tablets Diethylstilbestrol 0.1 mg and 0.5 mg

Suppositories Diethylstilbestrol 0.1 mg and 0.5 mg

THE LAKESIDE LABORATORIES, INC., MILWAUKEE

Tablets Diethylstilbestrol 0.1 mg

THE UPJOHN COMPANY, KALAMAZOO, MICH

Capsules Diethylstilbestrol 0.1 mg, 0.5 mg and 10 mg

Ampoules Sterile Solution Diethylstilbestrol (in vegetable oil), 0.5 mg per cc 1 cc

Ampoules Sterile Solution Diethylstilbestrol (in vegetable oil), 10 mg per cc 1 cc

Suppositories Diethylstilbestrol (Juvenile Size) 0.1 mg

Suppositories Diethylstilbestrol (Adult Size) 0.5 mg

E. R. SQUIBB & SONS, NEW YORK

Tablets Diethylstilbestrol 0.1 mg, 0.5 mg, 10 mg and 50 mg

Ampuls Diethylstilbestrol (in corn oil), 0.2 mg per cc 1 cc

Ampuls Diethylstilbestrol (in corn oil), 0.5 mg per cc 1 cc

Ampuls Diethylstilbestrol (in corn oil), 10 mg per cc 1 cc

Ampuls Diethylstilbestrol (in corn oil), 50 mg per cc 1 cc

Diethylstilbestrol Pessaries 0.1 and 0.5 mg

TETANUS TOXOID—Tetanus Toxoid is a sterile solution of the product of growth of the tetanus bacillus (*Clostridium tetani*) so modified by treatment with solution of formaldehyde as to have lost the ability to cause toxic effects in guinea pigs but retaining the property of inducing active immunity.

The toxicity of Tetanus Toxoid shall be so low that 5 cc of the material does not cause any symptoms of tetanus in a guinea pig within a period of twenty-one days after its injection into the animal. The antigenic value shall be such that 1 cc of the material six weeks after injection shall protect at least 80 per cent of guinea pigs from all symptoms of tetanus for a period of ten days after the injection of 10 minimum lethal doses of tetanus test toxin into each animal.

Actions, Uses and Dosage—To protect against infection three doses of 1 cc each intramuscularly or subcutaneously with an interval of three weeks between injections. An additional dose of 1 cc should be given at the time of injury or infection.

LEDERLE LABORATORIES, INC., PEARL RIVER, N. Y.

Tetanus Toxoid (*Fluid*) 1 cc and 30 cc vials in packages of one 1 cc vial, three 1 cc vials and one 30 cc vial.

SODIUM BENZOATE—When dried at 100 C for six hours contains not less than 99 per cent of $\text{C}_6\text{H}_5\text{COONa}$. U. S. P.

Actions and Uses—The intravenous use of sodium benzoate as a liver function test was suggested by Quick and his co-workers in 1938 (Quick, A. J., Ottenstein, H. N. and Weltcheck, Herbert, *Proc. Soc. Exp. Biol. & Med.* 33: 77 [Feb.] 1938) to overcome the disadvantages associated with its oral administration. In the presence of normal liver function

in man, benzoic acid is excreted as hippuric acid. The rate at which this material is excreted determines the functional ability of the liver and often demonstrates the presence of liver damage before clinical signs are evident.

The test is contraindicated in the presence of renal disease, because here the hippuric acid is but partially eliminated.

Dosage—The bladder is emptied before administration of the drug. Inject slowly intravenously, 20 cc of sodium benzoate solution containing 1.77 Gm of the salt (equivalent to 1.5 Gm of benzoic acid) using not less than five minutes for the injection. Exactly one hour after the injection a complete urine specimen is collected and the amount of hippuric acid determined by the method developed by Quick (Quick, A. J., *Am. J. Digest. Dis.* 6: 710 [Dec.] 1939).

An adult with a normal liver will excrete at least 1 Gm of hippuric acid (equivalent to 0.68 Gm of benzoic acid) within one hour after receiving sodium benzoate intravenously.

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO.

Ampul Sodium Benzoate Solution 1.77 Gm (equivalent to 1.5 Gm benzoic acid) in 20 cc.

ALLERGENIC EXTRACTS (See New and Nonofficial Remedies, 1942, p. 1)

U. S. STANDARD PRODUCTS CO., WOODWORTH, WIS.

The following additional allergenic extracts marketed in 5 cc vials representing 20,000 pollen units per cubic centimeter, have been accepted:

Alfalfa (Turf) Alfalfa Beret (Buck) Birch (Woods) Burning Bush Cedar (Mountain) Chrysanthemum Clover (Red) Clover (Sweet) Dandelion Daisy (Ox-eye) Fescue Pine (Virginia) Pignut (American) Poplar (Lombardy) Ragweed (Swedish) Sage (Common) Sycamore (Prunus) Sycamore (Sudan) Grass Sanguinaria Sycamore Grass Walnut (Black) Water Hemp (Western) Wheat (Field) Yarrow Docks

The following product is supplied in 5 cc vials representing 30,000 pollen units per cubic centimeter and in packages of four 5 cc vials representing respectively 100, 1,000, 10,000 and 100,000 pollen units per cubic centimeter.

Ragweed Combined (Giant and Common Ragweed in equal parts)

The following product is supplied in 5 cc vials representing 30,000 pollen units per cubic centimeter.

Grass Combined (Bermuda Jun Grass Orchard Grass Red Top, Sweet Vernal Grass and Timothy in equal parts)

MERSALYL AND THEOPHYLLINE—A mixture containing two parts by weight of mersalyl U. S. P. and one part by weight of theophylline U. S. P.

Actions and Uses—(See New and Nonofficial Remedies, 1942, p. 320 under Salyrgan-Theophylline Solution.)

Dosage—Two tablets may be given in one dose in the morning after breakfast and repeated in four to five days if required. As an adjunct to intravenous medication, one tablet may be given daily for one or two weeks but in such instances rest periods of one or two weeks should intervene between courses of treatment.

WINTHROP CHEMICAL COMPANY, INC., NEW YORK

Salyrgan-Theophylline Tablets. Each tablet contains 0.08 Gm. mersalyl and 0.04 Gm. theophylline.

SULFAGUANIDINE (See New and Nonofficial Remedies, 1942, p. 159)

The following dosage forms have been accepted

LEDERLE LABORATORIES, INC., PEARL RIVER, N. Y.

Sulfaguanidine (*Powder*) bulk.

Tablets Sulfaguanidine 0.5 Gm. (7.7 grains)

SULFAPYRIDINE (See New and Nonofficial Remedies, 1942, p. 146)

The following dosage form has been accepted

PITMAN-MOORE COMPANY, INDIANAPOLIS

Tablets Sulfapyridine 0.5 Gm. (7.7 grains)

ETHYL AMINO BENZOATE (See New and Nonofficial Remedies, 1942, p. 65)

The following dosage forms have been accepted

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO.

Benzocaine in Oil. Bottles of 1 fluid ounce and 1 pint. Contains benzocaine 2.5 per cent W/V and croton-chastorel 0.5 per cent W/V in cottonseed oil.

SATURDAY, JUNE 12, 1943

REORGANIZATION OF UNITED STATES PUBLIC HEALTH SERVICE

The labyrinth of federal public health legislation extending over a period of one hundred and forty-three years has not produced a uniform pattern of requirements with respect to the administrative operations of the Public Health Service. Now a more efficient organizational structure of the Service is proposed by legislation pending in Congress, introduced at the request of the Administrator of the Federal Security Agency. The structure, according to Administrator McNutt, is extremely cumbersome at present, resulting inevitably in an overlapping of functions and in a duplication of effort. Important war responsibilities too have been imposed on the Public Health Service which emphasize the need for internal reorganization.

Senate and House committees have conducted hearings on companion bills, S. 400 and H. R. 649, introduced respectively by Senator Thomas and Representative Bulwinkle to give effect to the recommendations of the Administrator of the Federal Security Agency. The Senate bill has already passed the Senate in an amended form. As amended, it provides that the Public Health Service will consist of the Office of Surgeon General, the National Institute of Health and two bureaus to be known as the Bureau of Medical Services, to operate all hospitals and clinics under the jurisdiction of the Service, and the Bureau of State Services, to administer grants-in-aid and to supervise services to the several states. The Surgeon General will be authorized to assign functions and to establish within the National Institute of Health the two bureaus and in the Office of the Surgeon General such divisions, sections and other units as may be required. In this way, according to the report of the Senate Committee on Education and Labor, it will be possible to place like functions within controlling units, eliminating greatly the need for coordination and leaving to subordinate officers many details which now inevitably find their way to the Surgeon General.

The Director of the National Institute of Health, the chiefs of each of the bureaus, and the officer assigned

as Chief Medical Officer of the United States Coast Guard will be commissioned medical officers detailed by the Surgeon General from the regular corps and while so detailed will be Assistant Surgeon Generals and will have the same grade and will receive the same pay and allowances as the Assistant to the Surgeon General. In the office of the Surgeon General there will be established a Dental Division and a Sanitary Engineering Division. The chiefs of such divisions will be a commissioned dental officer and a commissioned sanitary engineer officer respectively, each of whom will have the grade, pay and allowances of an Assistant Surgeon General.

In addition to the provisions of the legislation relating to the reorganization of the Service, provisions are included to provide for commissioned officers of the Service a parity of promotion, pay and benefits with commissioned officers of the Medical Corps of the Army. In time of war or national emergency, any commissioned officer of the regular corps of the Public Health Service may be appointed to a higher temporary grade with the pay and allowances thereof without vacating his permanent appointment. Reserve officers of the Service may be distributed in the several grades without regard to the proportion which at any time obtains or has obtained among the commissioned medical officers of the Service.

The record of each commissioned officer of the regular corps initially appointed above the grade of Assistant Surgeon, after the first three years of service in such grade, will be reviewed and any such officer who is found to be unqualified for further service will be separated from the Service and paid six months' pay and allowances. Original appointments in the commissioned corps both regular and reserve, may be made to a junior grade which shall correspond to that held by a second lieutenant in the Medical Department of the Army; persons so appointed will be entitled to the same pay and allowances as a second lieutenant in the Medical Department of the Army. After not less than one nor more than two years of service, each such appointee in the regular corps may be examined and either promoted to the grade of Assistant Surgeon or separated from the Service.

Commissioned officers of the Public Health Service, regular and reserve, will be entitled to the same pay, allowances and all other rights, benefits and privileges authorized or provided for officers of corresponding grade of the Medical Corps of the Army. All commissioned officers of the Service detailed for duty with the Army or Navy will be held and considered to be in the active military service of the United States. While so detailed they will be subject to all the laws and regulations operative for the government of the respective services to which they are detailed. The additional benefits to be granted by this legislation will be available to commissioned officers of the Service.

regular and reserve, and to their surviving dependents, it may who were serving outside the continental limits of the United States on Dec 7, 1941 or who since that date have been made prisoners of war or who have been disabled or who have lost their lives while on active duty

This legislation contains nothing further to extend the activities or further to enlarge the powers of the Public Health Service. In the language of the Senate Committee on Education and Labor, it merely provides "for an orderly readjustment of the many activities of the Service from an administrative standpoint, provides for the much needed temporary promotion for certain officers in the Service and provides reasonable benefits for the officers of the Service in connection with their duties to the armed forces."

One Senate amendment to the Senate bill provides that "for the duration of the present war and for six months thereafter graduates of reputable osteopathic colleges shall be eligible for appointment as reserve officers in the Public Health Service." In all other respects, the legislation seems to propose an improvement in the quality of services rendered by the personnel of the Service. The osteopathic amendment, if permitted to remain in the bill will inevitably have the opposite effect by its recognition of an inferior type of medical education. Certainly it will not increase the good repute of the Service. The Medical Departments of the Army and Navy have consistently insisted that the high quality of their commissioned personnel be maintained. The Federal Security Agency and the United States Public Health Service should do everything possible to prevent the enactment of legislation designed to undermine standards. Let the people continue to have faith in the dependability of the United States Public Health Service.

ASPHYXIATED TUBERCULOSIS VACCINE

The tubercle bacillus survives a temperature as low as that of liquid helium as well as freezing up to two hundred times with liquid nitrogen.¹ In this remarkable resistance to cold the bacillus differs from mammalian cells and tissues, the activities of which are retarded in temperatures near the freezing point but which in general do not survive actual freezing. The prolonged survival of the bacillus when frozen may be explained by dormancy on the part of its enzymes under low temperature. The bacillus can survive desiccation also. Hermetically sealed in glass capsules containing less than one billionth of an atmosphere, the bacillus survived more than one year at body temperature. In this experiment the bacillus was very dry, which may have contributed to its dormancy. Incubated in a par-

tial vacuum, saturated with water vapor but deprived of oxygen, the bacillus lost all power of growth, even when introduced into the most highly susceptible animal body. The bacillus, so to speak, was asphyxiated but without loss of antigenic action as revealed by immunizing animals with avian and human strains of asphyxiated tubercle bacilli.

Preparation of a nonviable asphyxiated tuberculosis vaccine with immunizing power allegedly superior for laboratory animals to other products is reported by Potter² of the Laboratory of Preventive Medicine, University of Chicago. Numerous investigators³ have attempted to obtain a relatively undenatured tuberculosis vaccine by storing dry tubercle bacilli at refrigerator temperatures in the maximum vacuum obtainable with a high grade mercury pump. Such stored bacilli remain alive and fully infective for at least two years, presumably because of a nearly complete metabolic standstill caused by absence of moisture and warmth. In order to kill the bacilli by lack of oxygen, Potter therefore repeated the tests under conditions that maintained normal moisture and optimal temperature.

Highly virulent human tubercle bacilli were placed in empty pyrex test tubes together with 0.5 cc of freshly boiled tap water. The oxygen was then removed in three stages, first by prolonged evacuation with a Hvac pump, by which the estimated oxygen pressure was reduced to a two-hundredth part of that of the original air. Second, the evacuated tubes were filled and reevacuated seven times with electrolytic hydrogen, after which lavage only a hundred-thousandth part of the original oxygen remained in the tubes. Finally the residual traces of oxygen and hydrogen were absorbed on powdered palladium sponge. The tubes were then stored in the dark at 38 C.

All organisms from tubes thus prepared and opened between the twentieth and forty-second day of storage failed to grow when plated on a variety of favorable culture mediums. Five to 10 guinea pigs were injected subcutaneously with each asphyxiated sample. Guinea pigs injected with the twenty to twenty-five day asphyxiated cultures occasionally developed tuberculosis. All guinea pigs injected with cultures asphyxiated for at least thirty days showed no evidence of tuberculosis when killed eight weeks later. Similar results were obtained with asphyxiated highly virulent bovine and avian strains, 6 week old chicks being used as the test animal.

Since tubercle bacilli killed by asphyxiation are presumably less denatured than bacilli killed by heat or chemical antiseptics, it would seem reasonable to hope that asphyxiated vaccines would have immunizing powers superior to those of any other nonviable tuberculosis vaccine thus far tested. A series of rabbits and pigeons were therefore given five subcutaneous injections at five day intervals of asphyxiated avian

tubercle bacilli. The pigeons continued well for seven and one-half months, at which time they were killed, necropsies revealing almost complete disintegration and absorption of the injected vaccine without active tuberculosis. The rabbits were killed from one year to seventeen months after vaccination, at which time they were also without signs of tuberculosis.

Beginning at four and one-half months after this vaccination, groups of rabbits with an equal number of nonvaccinated controls were tested for acquired immunity by intravenous injection of massive test doses of living avian tubercle bacilli. The vaccinated rabbits developed but one-sixth as many lesions as the controls and by the end of fifteen months had shown but one-fourth their tuberculosis mortality. This degree of postvaccinal immunity is apparently superior to that reported by Opie and Freund following vaccination with heat killed tubercle bacilli. Potter's tests show that an appreciable degree of the postvaccinal immunity persists for at least a year, with full duration not yet determined. Attempts to improve the nonviable tuberculosis vaccine by adopting methods that would facilitate more rapid interstitial disintegration and absorption of the injected asphyxiated bacilli are now in progress.

Current Comment

DELAYED RUPTURE OF THE SPLEEN

Delayed splenic rupture and the syndrome which accompanies it, rare in peacetime now takes on new importance because of its potentially great increase in incidence resulting from warfare. In a recent review of this subject Zabinski and Harkins¹ analyzed 66 reported cases of traumatic subcutaneous rupture of the spleen with delayed hemorrhage, including 4 of their own. Delayed splenic rupture is most common in men in the third decade in life. Falls and traffic accidents are the most common etiologic agents. About 50 per cent of the secondary ruptures occur after intervals of less than seven days, while in an additional 25 per cent the latent period ends during the second week. Fractured ribs on the left side occur in about 10 per cent of the cases. Kehr's sign (pain in the left shoulder due to irritation of the phrenic nerve) is present in about 28 per cent or more of the cases. Other diagnostic signs are similar to those occurring in any type of splenic rupture such as sudden collapse or shock, rapid or increasing pulse rate, progressive anemia, white cell count from 12,000 to 20,000, absence of fever over 99 F, pain, tenderness, dullness and rigidity in the upper left quadrant and in some instances signs of free fluid in the peritoneal cavity. Without operation, mortality ranges from 77 to 100 per cent. When splenic laceration is suspected, Zabinski and Harkins say, the patient should be kept in bed under close observation. When the diagnosis is reasonably

definite, or at the first sign of secondary hemorrhage, splenectomy should be performed. Adequate treatment of shock with plasma or whole blood forms a necessary adjunct to the operative procedure. This syndrome is especially insidious and treacherous because of the almost symptom free latent period, but this delay also offers an opportunity for diagnosis and proper treatment.

HYPERVITAMINOTIC GALLSTONES

According to data recently reported by Ruth Okey¹ of the Department of Home Economics, University of California, an excessive intake of vitamin B may lead under certain nutritional conditions to the formation of gallstones in experimental animals. The California biochemist studied the vitamin tolerance of guinea pigs maintained on a basic diet consisting of casein, crisco, wheat bran, dried brewers' yeast, Hubbels salt, agar and cornstarch, plus 1 per cent cholesterol. This diet was supplemented by a daily pipet feeding of a vitamin mixture consisting of cerophyll, carotene, irradiated ergosterol, orange juice, wheat germ oil and other factors previously found necessary for maximum growth. Control (cholesterol free) animals of this series had a growth rate slightly less than animals maintained on their previous stock diet. Okey attempted to improve their nutrition by a supplementary daily administration of 25 micrograms of riboflavin, 125 micrograms of calcium pantothenate or both. These supplementary vitamins increased the apparent well being of both control and cholesterol fed animals, but to her surprise the guinea pigs which were fed cholesterol and given supplementary vitamin B showed an abrupt and usually fatal anemia without the usual preliminary loss of weight or other signs of illness. Eighty per cent of the necropsies in these fatal cases revealed gallstones (often impacted) accompanied by irritating lesions of the gallbladder and biliary passages. Fifteen per cent of the fatal cases showed "murky" bile but without macroscopic gallstones. Satisfactory necropsies were not possible on two other fatalities, since the animals died at night and the gallbladder had burst and their contents had been lost. All control guinea pigs of the series of animals not given the vitamin B supplement but fed cholesterol were free from gallstones. Reviewing previous necropsy records Okey found that all previously recorded cases of gallstones were associated with diets particularly rich in cholesterol (unextracted casein and/or egg yolk) and diets also probably containing an excess of riboflavin. The conclusion seems inevitable that an overabundance of vitamin B will lead to gallstone formation in animals otherwise tolerant to cholesterol rich diets. Taken in connection with the recent demonstration of the deleterious effects of excessive doses of thiamine on natural resistance to experimental poliomyelitis,² Okey's observations are of basic clinical interest. Analyses of her vitaminogenic gallstones showed that they were rich in calcium phosphate although containing some cholesterol.

THE SURGEON GENERAL OF THE ARMY

On June 1 Major Gen Norman T Kirk became Surgeon General of the Army succeeding Major Gen James C Migeo who retired with an excellent record for leadership and for the maintenance of high standards in the military medical service. The medical department of the Army has grown in size and importance beyond anything ever previously anticipated. There are now thirty-four general hospitals and about five hundred station hospitals in the continental United States and a great number of other army hospitals scattered throughout the world. Brigadier General Kirk, who as surgeon general will hold the rank of major general relinquished at the time of his appointment the position of commanding officer of the new Percy Jones General Hospital at Battle Creek, Mich. In 1919 General Kirk was in the surgical service at Walter Reed General Hospital and later had duty at Johns Hopkins University Hospital, the Massachusetts General Hospital and the Station Hospital at Fort Sam Houston, Texas where he became chief of the surgical service. He served subsequently as chief of the surgical service at Sternberg General Hospital in Manila, the Station Hospital at Fort Mills in the Philippine Islands, again at Sternberg and later at the Walter Reed General Hospital in Washington. General Kirk addressed the House of Delegates of the American Medical Association at its opening session in Chicago on June 7. The medical profession will, of course, tender to him, as it has to his predecessors, the complete support that is so vital in maintaining for our troops the high quality of medical care that has been exemplified in the past.

ARCHITECTS LOOK AHEAD IN
HOSPITAL PLANNING

The *Architectural Forum* for May contains two articles written by architects discussing the designing of hospitals and health facilities of the future. The architectural problems faced include the use of new materials, new types of design for better utilization of space and sunlight and low cost. Both of these articles are of interest as being indicative of forethought on the part of the architects in the planning of hospitals and health centers when their building again becomes possible.

ISOLATION OF PROTEIN HORMONES OF
THE PITUITARY BODY

The pituitary body dominates the glands of internal secretion through the hormones produced by its anterior or glandular lobe. Growth, reproduction and metabolism are regulated by these hormones, which are believed to be proteins. The isolation and characteristics of these proteins are receiving close cooperative attention from biologists and chemists. The progress of current investigations in this field was reviewed at a recent conference in New York¹. Shedlovsky, discussing the criteria of purity of proteins, points out that in the case of biologically active substances the evidence on which to base judgment as to purity must come from three distinct sources, namely accurate biologic assays,

chemical analyses and studies in electrophoresis, solubility and ultracentrifugation. Significant progress is recorded in the work on the follicle stimulating (Chow), the luteinizing (Fevold) and the growth and metabolic (Long) hormones of the anterior pituitary, but conclusive results have not yet been reached. According to Abraham White the lactogenic hormone, best known as prolactin, is the first anterior pituitary hormone to be isolated in pure form. The evidence at hand indicates that prolactin is a protein. Recently this hormone has been found to induce corpus luteum activity in hypophysectomized rats. Irving and du Vigneaud summarized the status of the posterior pituitary hormone problem by saying that the pressor and oxy-

MAJOR GENERAL NORMAN T. KIRK

toc hormones isolated from the posterior lobe have not yet been obtained in pure form, but highly potent preparations represent "fairly pure preparations of separate molecules which may be similar chemically." A protein with pressor, oxytocic and antidiuretic activity has been isolated from the posterior lobe in what seems to be pure form, but further work is necessary before this protein can be accepted as a posterior lobe hormone with multiple activities. As emphasized by van Dyke in his introduction to the conference, biologists and chemists must continue their alliance in research toward the isolation of the hormones of the pituitary in pure forms. This is the only way by which advances can be made in the solution of some of the problems of this extraordinarily complex gland.

¹ van Dyke, H. B., Chow, B., Bacon, F., du Vigneaud, Vincent, Fevold, H. L., Irving, George W. Jr., Long, C. N., Shedlovsky, Theodore and White, Abraham. Protein Hormones of the Pituitary Body. *Ann. New York Acad. Sc.* 13: 253 (Feb. 26) 1943.

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on War Participation of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war and such other information and announcements as will be useful to the medical profession

ARMY

SOLDIERS GET HIGH QUALITY OF MEDICAL TREATMENT

The Office of War Information announced on May 19 that more than 97 per cent of the naval and marine wounded at Pearl Harbor to March 11, 1943 have recovered and that an analysis of available data on the army wounded shows that recoveries are comparable to naval and marine percentages. Never before in history the Office of War Information states, has the fighting man had available such medical care and equipment as the United States now furnishes its defenders. The care of the wounded under the American system of military medicine begins with the soldier himself, each one having fastened to his belt a first aid packet, a package of sulfadiazine tablets and a sulfonamide powder. If the soldier is conscious after being wounded he begins to take the sulfadiazine tablets at once, dusts the sulfonamide powder in his wound and uses the first aid packet. In all probability, however, a hospital corpsman has come to his aid before he has a chance to do this. The corpsman administers quickly to the soldier, ties a lig to the soldier's belt showing what treatment has been given, fixes a bit of gauze to a bayonet or stick to mark the soldier's location and then goes forward with the attack. Litter bearers then carry the wounded soldier to a battalion aid station farther back where he is attended by physicians and cared for until he can be removed in an ambulance or other conveyance still farther back to the collecting stations. Here the various cases are classified and the more seriously wounded taken to field or evacuation hospitals usually from 5 to 7 miles from the fighting front. The field hospitals are mobile but equipped with the most modern supplies and staffed by expert surgeons with specialists available for all kinds of injuries. Farther back are the large general or base hospitals, usually several hundred miles from the battle area and the equal in equipment to the most elaborate city hospitals. Here the wounded may remain until fully recovered and returned to duty or they may be sent to hospitals in the United States. Some wounded men in distant battlefields have reached the homeland faster than the report of their having been wounded. A severely wounded soldier was brought home for treatment from Egypt by ambulance plane in seventy-two hours, others have been flown to the homeland from the Far East, India and Africa. Should medical supplies be delayed in reaching the battle area, American doctors have been trained to perform their duties with such equipment as is at hand. Some ships carrying medical supplies for the North African campaign were torpedoed and yet a system of caring for the wounded was established right from the beaches of the Mediterranean, that this method also was effective was shown by the hundreds of recoveries from wounds.

ANNUAL MEETING OF MILITARY SURGEONS

The Association of Military Surgeons of the United States will hold its fifty-first annual convention in Philadelphia at the Bellevue-Stratford Hotel on October 21-23. Doctors will assemble from all fronts where United States forces are fighting and from the great base hospitals where rehabilitation of the wounded is in progress, bringing with them information on the latest techniques of wartime medicine and surgery. Lectures, demonstrations, moving pictures and teaching panels are planned to present data to the convention.

The honorary chairman of this convention is Rear Admiral Ross T. McIntire, Surgeon General of the Navy. The general chairman is Capt. Joseph A. Biello, Medical Corps, U. S. Navy. The vice chairmen are Brig. Gen. George F. Lull, M. C., U. S. Army, of Washington, D. C., and Comdr. E. L. Bortz, MC, USNR of Philadelphia. National officers of the association are as follows: president, Capt. William L. Mann, MC, USN, National Naval Medical Center, Bethesda, Md.; first vice president, Col. Lucius A. Salisbury, Medical Corps, New York National Guard; second vice president, Asst. Surg. Gen. Warren F. Draper, U. S. Public Health Service; third vice president, Col. Edgar Erskine Hume, Medical Corps, U. S. Army; fourth vice president, Col. Irvin Abell, Medical Reserve, U. S. Army; fifth vice president, Dr. Martin L. Cooley, Veteran's Administration; secretary, Col. James M. Phalen, U. S. Army (retired); and executive secretary, Stuart E. Womeldorf.

REDUCE NUMBER OF DOCTORS ALLOTTED TO CERTAIN UNITS

The War Department has ordered that as a general policy and in order to place the medical officers available where they are most needed, regimental and separate units, such as battalions, which now are authorized to have two medical officers by the Tables of Organization will be provided only with one medical officer while in continental United States. Before such units go overseas, the number of medical officers will be increased to Tables of Organization strength.

All Tables of Organization which include medical and dental officers will be revised to show, in the case of attached medical and dental officers, that they will be furnished only as required and available in continental United States. All medical and dental officers designated in Tables of Organization as captains or as first lieutenants will be shown as authorized in either rank, no specification being made.

WAR DEPARTMENT ORDERS EXERCISE FOR HEALTH

The War Department has ordered, according to the *Army and Navy Journal*, that, whenever possible, the duties of officers whose work is confined primarily to offices will be so arranged that each such officer will be allowed at least one-half day a week other than holidays and Sundays for physical exercise in the interest of good health and mental fitness. Exercise in the open air or in a well ventilated room will be taken regularly by all officers not actually participating in active outdoor instruction of troops.

PERMANENT PROMOTIONS

The President of the United States has nominated, among others in a list of army officers for permanent promotion in the regular army, the following in the medical corps: Albert R. Driesbach from captain to major; James E. Vickers, George Arack, Robert G. Rate and Ivan C. Dummick Jr., from first lieutenants to captains; and from lieutenant colonel to colonel Andrew W. Smith, No. 80 on the lieutenant colonel's relative list, M. C., to and including Seymour C. Schwartz, No. 103.

THE MOORE GENERAL HOSPITAL

The Moore General Hospital is situated in the picturesque Swannanoa Valley surrounded by mountains, 13 miles west of Asheville, N. C. The elevation is 2,250 feet. A short railroad spur connecting the main line of the Southern Railroad with the hospital proper expedites the movement of patients, in that hospital trains may be drawn into a specially constructed station on the hospital reservation. Here a covered platform has been built level with the railway car floor, where patients can be easily removed and placed in the station. Ambulances receive patients from a completely closed in and heated platform and transmit them to the receiving office where they are unloaded on a similarly constructed platform. This cantonment type hospital at present has 1,520 beds available and it has been authorized to administer fever therapy.

The medical officers at present on duty are:

Col Frank W. Wilson, Commanding
Lieut. Col. Roger H. Albright, Hospital Inspector and Plans and Training Officer
1st Lieut. Jacob J. Better, Surgery
1st Lieut. Stephen M. Clement, Neuropsychiatry
Major Nathan B. Cohen, Chief, Eye, Ear, Nose and Throat
1st Lieut. Robert M. Dicus, Jr., Orthopedics
Major Louis S. Faust, Assistant Chief of Medical Service, Chief of Cardiovascular Section
Capt. Joseph H. Garthe, Chief of Communicable Diseases
Major Thomas A. Gibson, Executive Officer and Public Relations Officer
1st Lieut. Silvio M. Guglielmelli, Medical Service
Major Willard F. Hollenbeck, Chief of Medical Service and Chief of Gastrointestinal Section
1st Lieut. Robert K. Harvey, Orthopedics
Major John S. Hooker, Sr., Chief of General Medicine Section
Major William A. Hunter, Chief of Neuropsychiatric Section
Capt. Charles W. Knerler, Chief of Dermatology and Syphilitic Section
Capt. Eugene H. King, Medical Service
Capt. Sol E. Kantor, Anesthetist
Capt. Edwin F. Lathbury, Eye, Ear, Nose and Throat
1st Lieut. Oscar Legault, Neuropsychiatry
1st Lieut. Alfred D. Levick, Surgery
1st Lieut. James T. Marr, Roentgenology
1st Lieut. Henry B. Marshall, Urology
Capt. John S. McKee, Jr., Receiving and Disposition Officer
Capt. Francis J. McMahon, Surgery
Major Frank G. Murphy, Chief of Orthopedic Section
Capt. Dewey T. Nabors, Chief of Genitourinary Service
1st Lieut. James J. O'Leary, Jr., Assistant Chief of Surgical Service
Capt. Ferdinand Piazza, Assistant Receiving and Disposition Officer
Capt. Richard C. Ritter, Orthopedics
Major Earl W. Rothermal, Chief of Physical Therapy Section
Major Malcolm H. Rourke, Registrar, Trial Judge, Advocate, Commanding Officer Detachment of Patients, Intelligence Officer
Major George L. Sackett, Chief of Roentgenologic Service
Capt. Donato A. Santarsiero, Ophthalmologist
1st Lieut. Robert V. Schatken, Surgery
1st Lieut. Samuel Sober, Medical Service
Major Lester C. Thomas, Chief of Surgical Service
Capt. Calvert R. Trow, Medical Service
1st Lieut. Charles A. Tucker, Eye, Ear, Nose and Throat
1st Lieut. David Turnoff, Medical Service
Capt. Franklin H. Wakefield, Surgery
Capt. Thomas B. Wilson, Chief of Laboratory Service

PRECISION IN PLACEMENT OF MEDICAL SPECIALISTS

The War Department announced on May 27 that the Office of the Air Surgeon has placed in accordance with their professional specialties 98.8 per cent of all Army Air Forces medical officers who are qualified as specialists by the specialty boards or colleges of the medical profession of the remaining 1.2 per cent the large majority are officers assigned to administrative duty because of special ability in that field or functioning as executive officers and commanding officers of hospital installations.

This record of accurate utilization of the specialized qualifications of Army Air Forces medical officers has been achieved through constant watchfulness by the Office of the Air Surgeon. A constant check on the assignments of doctors on duty with the Army Air Forces by the Air Surgeon assures continuation of their efficient use.

ARMY HOSPITAL NEEDS SPECIAL TYPES OF PERSONNEL

The U. S. Army Finney General Hospital at Thomasville, Ga., is urgently in need of personnel with specialized types of training to complete its organization. Being unable to secure such personnel locally, the personnel director of the Finney General Hospital appeals to those trained and qualified for certain positions to make application to him as soon as possible. He also urgently requests any person who has acquaintances qualified for these positions to write in at once giving their names and addresses. The commanding officer of the Finney General Hospital is Col. S. M. Browne, and the personnel director is Capt. Cletus A. Sharkey. Application should be made on Civil Service form number 57, obtainable at any postoffice or civil service office. The following positions are available: medical technicians in bacteriology, roentgenology, surgery, chemistry and general laboratory work, assistant medical technicians in general laboratory work, bacteriology, roentgenology, surgery (tissue work) and chemistry, orthopedic mechanic, junior orthopedic mechanic, occupational therapy aides, dental mechanics, assistant dental mechanics, dental hygienists and dental assistants. The base pay plus bonus per annum for these various positions varies from \$1,750 a year to \$2,433.12 a year.

CLASS OF AVIATION PHYSIOLOGISTS

Another class of aviation physiologists graduated at the School of Aviation Medicine in Texas on April 17. The course of instruction covers the effects of lowered barometric pressure, anoxia and the effect of flight on man, the operation of low pressure chambers, the theory and practical use of oxygen equipment and the conduct of high altitude indoctrination and classification. Among the graduates were the following medical officers: all first lieutenants—Stephen J. Alexander, Jr., Crawfordsville, Ind.; Russell G. Barnes, Jr., Hastings, Minn.; Gordon A. Brown, St. Paul; William C. Browne, Corydon, Pa.; Daniel H. Cahoon, Boston; Albert W. Dautrich, Torrington, Conn.; Ward S. Fowler, Elkins Park, Pa.; William L. Hartmann, New York; Erle M. Heath, Pittsburgh; Henry F. Keiber, Staten Island, N. Y.; Donald R. McRae, Jr., Augusta, Ga.; Archibald G. Martin, Suffolk, Va.; Milton Mazer, Philadelphia; and Norman E. Mendenhall, Johnstown, Pa.

AMERICAN CASUALTIES IN NORTH AFRICA

The Secretary of War announced that from Nov. 8, 1942 to May 15, 1943 the American casualties in the North African military operations including the initial landings were 2,184 killed, 9,437 wounded and 6,937 missing including prisoners of war.

ARMY PERSONALS

Lieut. A. L. Batalion, Medical Corps, Army of the United States of America, W. Va., has been reported missing in action since February 17. Lieutenant Batalion was commissioned in the Army in October 1942.

Major John M. Cotton arrived in San Francisco a few days ago after spending sixteen months as executive officer at a base hospital in the South Pacific Area. Before entering the service in 1941, Major Cotton practiced psychiatry in New York. He praised the work done by those charged with bringing the sick and wounded from the front through the jungles to the base hospitals for treatment. In the more overgrown sections they had to resort to extreme ingenuity in devising any means possible to get the sick and wounded over the large gorges and through the thick mountain jungle.

Brig. Gen. James S. Simmons, A. U. S. director of the Preventive Medicine Division Office of the Surgeon General, United States Army, delivered the John Wickoff lectures at New York University on April 15 and 16. The title of the first lecture was "The Preventive Medicine Program of the United States Army" and of the second lecture "The Present

State of the Army's Health" Duke University, Durham, N C, conferred the honorary degree of Doctor of Science on General Simmons at commencement exercises on May 22

Col Charles F Shook, M C, of the supply division of the Surgeon General's Office, has been detailed to duty with the headquarters of the American Red Cross in Washington According to the *Military Surgeon*, Colonel Shook will represent the medical services of both the Army and the Navy in carrying on with the Red Cross in its campaign for blood plasma This work will require much travel to blood donor centers throughout the country

Dr Currier McPwen, dean of the New York University College of Medicine, has been granted a leave of absence from that position and has gone in the army, where he is serving as executive officer of the Bellevue Hospital affiliated unit, the First General Hospital, which is now in training at Fort George G Meade, Maryland

The promotion of Capt Miles G Bell, M A C, to major makes him the first Medical Administrative Corps officer candidate school graduate to attain that rank, while other M A C officers hold higher rank, theirs was received by direct commissions Major Bell is a graduate of the first O C S class at Carlisle Barracks, Pa, receiving his commission in September 1941 On graduation he remained as department of administration instructor Coming to Camp Berkeley, Texas, in May 1942 with the original group of officers to activate the O C S, he was made director of the department of administration Major Bell is the son of Lieut Col Charles A Bell, M C, retired now on duty at the Army and Navy General Hospital, Hot Springs, Ark

Lieut Col Charles R Ryburn, professor of psychiatry at the University of Oklahoma Medical School, is now serving as executive officer of the base hospital at Hunter Field, Savannah, Ga

Dr Joseph J Eller, New York, gave a lantern slide demonstration and lecture on "The Diagnosis and Treatment of Benign and Malignant Tumors of the Skin" before the Army medical and dental officers at Morrison Field, West Palm Beach, Fla, May 7

Major Saverio C Franco, M C, stationed at the 79th General Hospital, Camp White, Oregon, was promoted to the rank of lieutenant colonel on April 13

Major L Rush Lambert of Fairmont, W Va, state medical selective service officer, Charleston, W Va, was promoted to lieutenant colonel on March 6

MANUAL OF INDUSTRIAL NUTRITION

The Nutrition in Industry Division of the War Food Administration of the U S Department of Agriculture, Washington, D C, has published a "Manual of Industrial Nutrition," which is available on request from the Nutrition in Industry Division or from any one of the seven regional offices of the Food Dis-

tribution Administration Dr Robert S Goodhart, chief of the division, said that there is evidence that many of the usual practices associated with the preparation and service of food in plant cafeterias and restaurants result in serious losses in food values This booklet outlines the effect these food losses may have on absenteeism and production and on the ways in which food may be selected, prepared and served in order to reduce unnecessary losses in food values It is said that the losses of thiamine ran as high as 92 per cent in the preparation of a meal of meat, potatoes and beans in one plant cafeteria

OFFICERS ON DUTY AT CAMP CARSON

The new station hospital at Camp Carson, Colorado, is located on the plains a few miles out of Colorado Springs The following list shows the chiefs of sections and other officers now on duty at the station hospital

Col John I Marker, Commanding Officer
Capt Edward D Greenwood, Executive Officer and Chief, Neuro psychiatry Section
Major James C Harberson, Chief, Surgical Service
Lieut Col Philip S Hench, Chief, Medical Service
Major William M B Brown, Chief, Eye, Ear, Nose and Throat Clinic
Major Harry W Woodward, Chief, Orthopedic Section
Capt Lester W Baird, Chief, Roentgenologic Section
Capt Richard H Mullen, Chief, Physical Therapy
Capt Aaron D Vogelsang, Chief, Genitourinary Section
1st Lieut George A Bradasch, Chief, Anesthesia Section
Major Robert O Garvin, Chief, Gastroenterology Section
Capt Henry A Brunsting, Chief, Dermatology Section
Capt Paul E Laville, Chief, Laboratory Service
Capt Donald W Ingham, Chief, Cardiovascular Section
Capt Nathaniel J Cohen, Chief, Communicable Disease Section
Capt John C Nunemaker, Librarian
Major James L Blanton, 1st Lieut Edgar S Brintnall, Capt Winfield L Bultsch, Capt Donald C Campbell, Capt Howard C Coggeshall, Capt Dawson A Dowell, Major Thomas J Dry, Capt Earl M Edison, Major Clifford O Erickson, Capt R Gibson, Capt Wendell C Kelly, Major Harry W LeTevre, 1st Lieut Martin L List, Capt Arthur S Manna, Capt Fayette D Severance, Capt Gerald H Smith, Capt Malcolm C Fodd, 1st Lieut George L Walker, Capt David R Wall

THE DIVISION OF MEDICAL INTELLIGENCE

Dr Gaylord W Anderson, head of the division of preventive medicine and public health of the University of Minnesota School of Medicine, has been granted a leave of absence from that position in order that he may serve as head of the division of medical intelligence in the Office of the Surgeon General of the Army in Washington, D C The division of medical intelligence compiles health, climatic and sanitation evidence with respect to every area to which United States troops may be sent Such matters as the types of insects, snakes and diseases peculiar to the area, degrees of heat and humidity, poisonous plants, necessary dietary precautions and probable purity of the water supply are included in comprehensive surveys

NAVY

LIEUTENANT ROBERTS AWARDED SILVER STAR

Lieutenant (jg) Charles Purcell Roberts, USNR, of Atlanta, Georgia, has been awarded the Silver Star for services "above and beyond" the line of duty in action as a medical officer serving with a beach party of a U S Navy transport during the occupation of French Morocco The commanding officer of the ship on which Lieutenant Roberts was serving made the following recommendation concerning the award

As the medical officer of the Naval Beach party of the U S S *Edward Rutledge*, which vessel transported the assault units of the 3rd Battalion of the 30th Infantry, U S A, and participated with them in the landing and attack operations upon Fedala, French Morocco, which resulted in the capture of the city and the quick capitulation of French Morocco, Charles Purcell Roberts, Lieutenant, junior grade, MC-V(S), U S Naval Reserve, showed exceptional gallantry and devotion to duty in his constant and tireless efforts, above and beyond the limits of ordinary endurance to succor the wounded and administer surgical aid which directly resulted in saving life and limbs

During the period of Beach Party operations the medical unit suffered frequent strafing and bombing attacks from the air as well as from land installations and he was notable for his coolness, personal bravery, leadership and constant concern for both his patients and hospital corps personnel During the bombing and strafing of the beach by enemy planes, Dr Roberts calmly continued to administer intravenous plasma to a wounded soldier in the open field with utter disregard to his own safety His stamina, leadership and organizational ability was demonstrated by his handling of the wounded at the evacuation station at Fedala, where, for a considerable time, he was the only medical officer present He was held in great affection and admiration by those to whom he ministered

Lieutenant Roberts graduated at Emory University School of Medicine, served at the Peter Bent Brigham Hospital in Boston for two years, at the Rhode Island Hospital for one year, was resident physician at the Pratt Diagnostic Hospital, Boston, for two years, then practiced medicine in Boston until he entered the Navy in June 1942 Lieutenant Roberts is the son of Dr Charles W Roberts of Atlanta, a member of the Board of Trustees of the American Medical Association

MISCELLANEOUS

TRAINING OF MEDICAL PERSONNEL
IN U S S R BEFORE AND DURING
THE PRESENT WAR

PROF V LEBEDENKO

Representative of the Red Cross and Crescent of the Union of Socialist
Soviet Republics to the United States

Moscow

Quite recently the Union of Socialist Soviet Republics celebrated its twenty-fifth year of existence. Looking back one unwillingly begins to compare that which existed previously with the present as we know it. However, only such a comparison makes it possible for one to grasp the full significance of our accomplishments, concerning which we can speak with the greatest pride. Twenty-five years of building up a vast nation from its very roots, the colossal development of industry and agriculture, the introduction of new social concepts into the lives of the people, the inception of a new understanding of everyday commonplace existence—all these have required and still require of the millions of the population of our country a constant state of strain, tenseness and supreme strength and effort. Such conditions call for a nation of physically strong and healthy individuals.

For this reason one of the very first tasks which the Soviet government obligated itself to fulfil was to provide the nation with an adequate number of medical personnel and to reconstruct or rather actually to create, a new widespread system of social medicine.

In the fall of 1913, shortly before the first world war Russia could claim no more than 24 000 civil doctors of varied specialties. Of this total number 71 per cent were engaged in urban practice and only 29 per cent were distributed among the rural regions. Under these circumstances there were such instances as one general practitioner serving an area of 13 000 square versts with a population of as much as 40,000, and thus a region without road or other developed means of transportation. Also at this time, of the total number of doctors only 1 800 were surgeons.

The training of physicians in the old czarist empire prior to 1917 was accomplished in seventeen medical schools, associated with universities, courses of higher learning for women and military medical academies. Each year each of these schools graduated from less than 100 to no more than 200 or 250 doctors.

The explosion of the first world war in 1914, with the drafting and enlistment for military service of a large proportion of the medical profession, seriously affected the entire structure of civil medicine. The very first days of the war evidenced the woful lack of medical personnel both at the front and on the home front. This shortage was particularly felt in the field of surgery. As the war progressed this situation rapidly became worse. Therefore as one of its first sweeping reforms, the Soviet government was faced with the problem of providing for the population free medical care and service by highly trained personnel. This required an immediate expansion of educational and training facilities and the necessity of greatly increasing the ranks of the medical profession.

The year 1918 saw the opening of three new medical schools in three different cities. In 1922, sixteen addi-

tional medical schools were opened. This network of educational facilities grew year by year until at the beginning of the present war there were fifty-two medical schools in the country. In addition there then existed three military medical academies and nine stomatologic institutes. All these schools had an aggregate enrolment of 106,000. These institutions offer complete curriculums in therapy and general medicine, in sanitation and public health and in pediatrics. The overall purpose of all these institutes and courses was the preparation of doctors specializing in various fields.

The courses in therapy are designed to prepare the general practitioner. After being graduated from a five year course of this nature the physician is usually assigned to a rural district or to a hospital as a second (assistant) doctor.

The courses in hygiene, sanitation and public health are intended to give the doctor a general overall medical background and specifically to concentrate on questions of public health and hygiene. After being graduated from such courses, the doctor is in a position to practice independently immediately.

The third group of courses in pediatrics are organized so as not only to train students in the relatively narrow sphere of pediatrics but to prepare them as well to be directors of child care and welfare.

In addition to the fifty-two medical schools referred to twelve institutes were organized which offered to practicing physicians the possibility for study and further specialization. In addition to all this, many medical scientific research institutes were established. These have played a great role in raising the qualifications of a great number of physicians.

Glancing at these naked figures, one can scarcely visualize the tremendous organizational groundwork which was required in the establishment and operation of each of these schools. The problem was not only one of erecting buildings, supplying required apparatus and instruments, necessary textbooks and instruction materials as well as dormitories and other facilities for the students, but it required also the basic preparation of qualified teachers to staff these schools. Obviously all the preliminary organizational tasks were accomplished satisfactorily, since the present situation as regards preparation for a medical career remains the same as it was prior to 1941. Namely, there has been no curtailment of enrolment nor has the number of years required for completing a diploma course been reduced, and the full period of five years of study is still in effect. It is true that in the first year of the war the entire curriculum was cut down to four years, however, it was quickly seen that such a reduction was unnecessary and the five year course was reinstated. One of the best indications of the high quality of the medical personnel which these many institutes have trained is the fact that as high as 70 per cent of present war casualties have been returned to the front completely restored to health.

It is interesting here to say something about the way students are studying during these days of war particularly those in Moscow medical schools. In the fall of 1941 the work of the Moscow medical schools was disrupted temporarily during the fierce drive of the Nazi armies on the Soviet capital, but this situation lasted for only two months. The main body of students and professors was evacuated to other cities rather in the rear in the same manner as were evacuated all

the institutes which had existed in the regions occupied by the Nazis. All these schools are now carrying on their normal teaching and research functions just as they had been doing previous to their removal into the interior of the country. Further, as one may judge from the various periodical journals and reports of conferences, the standards of work and quality of these schools and institutes has not been lowered nor has it remained static at the same high level which it had reached prior to the war, but it has actually been greatly raised and improved.

In speaking of the problem of the preparation of the individual medical students for their work, it must be pointed out that this is often carried out in spite of great difficulties. Among these the most pressing are the material problems of existence and the questions of food and lodging created as a result of dislocation and hardships wrought by the war. These cannot be divorced from the basic procedure of study, since they undoubtedly under the present situation, require a great deal of time and energy to resolve.

However, each student with his great love of country and his consciousness of the debt of each citizen to his state and its people carries on his work selflessly and with the greatest success and achievement.

THREE TONS OF QUININE GIVEN TO ARMED FORCES

More than 3 tons of quinine, about 9,000,000 doses of 5 grains each, were presented to the armed forces by the American Pharmaceutical Association on May 11, according to the *Evening Star* (Washington, D. C.). The collection of quinine was begun on February 15 by thousands of American druggists (*The Journal*, Oct. 3, 1942, p. 377). The gift was received on behalf of the Army and Navy by Chairman May of the House Military Affairs Committee and Admiral Ross I. McIntire, Surgeon General of the Navy, at brief ceremonies at the institution's headquarters, 2215 Constitution Avenue, Washington, D. C. The quinine will be reprocessed in Navy laboratories and made available immediately to men in uniform. Dr. E. F. Kelly, secretary of the American Institution of Pharmacy, estimated the market value of the quinine at \$88,500.

PERU DONATES 100 POUNDS OF QUININE

The President of Peru recently gave to President Roosevelt 100 pounds of quinine, which was officially presented to the American Pharmaceutical Association, custodians of the National Quinine Pool, during a reception at the Hotel Shoreham in Washington, D. C., the Bureau of Medicine and Surgery, U. S. Navy, announced on May 27.

RESTRICTIONS REMOVED ON USE OF STEATITE TALC

The War Production Board issued on April 30 Conservation Order M-239 as amended. The new regulation removes the existing restrictions on the delivery and use of steatite talc for other than specified uses, establishes controls over the production and grading of steatite talc, provides a system of inventory control based on maximum consumer stocks, and releases all frozen stocks of steatite talc purchased prior to the original issuance of M-239 (Oct. 13, 1942). Consumer inventory restrictions on steatite talc under the amended order vary according to the kind of talc and its intended use. In the case of talc other than steatite talc, regardless of use, a six months supply is permitted, while in the case of steatite talc to be held by dealers or distributors a two months supply is allowed. Producers will file monthly reports on form PD-862 on all types

of talc received and ground. Consumers will report on form PD 863, on a quarterly basis, all types of talc received or used and indicate the end use to which this material is put.

WAR CIVILIAN SECURITY PROGRAM

The Federal Security Agency has published a general statement of the War Civilian Security Program as it affects members of the Citizens Defense Corps of the Office of Civilian Defense, Aircraft Warning Service and Civil Air Patrol. The temporary War Civilian Security Program of the Federal Security Agency includes medical care, public assistance and stated cash benefits for civilians whose aid is necessitated by enemy action. The purpose of this statement is to outline the program only as it affects certain civilian defense workers injured in the performance of official duties. Additional information may be obtained from the field representatives of these agencies.

PUBLIC HEALTH UNDER HITLER

The Russian Tass news agency quoted reports from Geneva as saying that a German military delegation visiting Budapest recently had "demanded" the mobilization of 3,000 Hungarian surgeons and "surgeon's assistants" for service with the Nazi forces.

The Tass dispatch, reported by the Federal Communications Commission from an English language Morse code transmission, said that Nazi officials had also demanded the mobilization of 70 per cent of the remaining civilian doctors in Rumania.

As stated in the *Hungary Post* of February 5, the Alsipian of Pest country, Laszlo Endre, in his report for the past quarter says, *Inter alia*, that the shortage of doctors is increasing. There are twenty-four district medical officers' posts vacant and forty-five district medical officers' posts are being dealt with by deputies. There are areas where two or three communities are without doctors, because so many medical men are on military service.

The *Medizinische Klinik*, Berlin, of February 5 published a report of the German medical conference in Prague, Czechoslovakia, on June 19, 1942. Dr. Kindermann gave a lecture on the frequency of tuberculosis in Prague. Tuberculosis was responsible for 214 deaths per hundred thousand inhabitants in 1922, while in 1936 the figure was 126. It rose again sharply in 1941 to 156 per hundred thousand inhabitants. The proportion between the sexes was 100:190, with a higher mortality rate for male patients. (The equivalent figures for the old reich territory were 100:120.) In the last few years some 1,200 people died annually of pulmonary tuberculosis in Prague, which would correspond roughly to about 4,500 cases of open pulmonary tuberculosis. This would mean that 45 people there out of each 10,000 suffer from this disease, while in the reich there are only 30 to 40 cases per 10,000. By compulsory registration, 2,000 of these 4,500 cases have become known and are being treated.

In an article on the diet of patients in wartime by Dr. W. Gerke, reported to the Office of War Information, the following advice is given: "Supplementary food should not be prescribed too freely, particularly in such cases of patients suffering from malignant tumors, because it is quite senseless to give for creamy milk, butter and eggs to be given to a patient suffering from the last stages of cancer. Adding these valuable foods to the diet of a cancer patient who, in the opinion of his doctor, is not expected to live not only involves a loss of our total food resources, it also is not to the interest of the patient or his relatives to prolong the usually very painful last stage by additional food of high caloric value."

The German *Reichs-Gesundheitsblatt* of February 3 contains an article by Dr. R. Rose on new ways of combating lice, describing the different methods for delousing. He

that serum prophylaxis plays only a minor part in the prevention of typhus and that the main point is the thorough extermination of the lice. This is the only means of surmounting the dangers from this disease. The chemicals and methods used in delousing do not at the same time act as disinfectants, as the delousing of infected people is not the duty of an ordinary delousing station but the task of the fever hospitals. Some of the methods mentioned are hot air, prussic acid vapors, a new and highly poisonous substance called Ventox and finally the dry cleaning of clothes by means of 'tetromin'. It must always be borne in mind that all materials used for delousing are made from chemicals which are in short supply and should therefore be applied sparingly.

Le Soir of January 30, 1941 made the following announcement: 'The secretary general of the Ministry of the Interior and of Public Health in Belgium has decided that expectant and nursing mothers are to be allowed precedence in the queues outside shops. On presentation of a special card these women will be able to be served before others. In the event of this right to priority not being respected, the person concerned may of course appeal to the police or gendarmes who are there to keep order in the queue. Any complaints should be addressed to the Infants' Welfare Center by whom the card was issued.'

In Kassel according to the Hamburg *Fremdenblatt* of January 10 the 93 year old Dr. Karl Hauptmann, an eye specialist, has resumed practice as locum tenens for a younger colleague who has been called up.

According to the *National Zeitung* Essen, Poland of January 7, in order to encourage German families to have many children the town of Leszno (Lissa) in the Warthegau has come to an exemplary decision. With a view to promoting germanization in the reconstructed territories families with three children will receive special premiums for every additional child, i.e. 25 reichsmarks for the fourth child, 50 for the fifth, 100 for the sixth and 150 for any further child. The payment will always be effected on the day of national regeneration, January 30. In addition parents will receive a lump sum of 20 reichsmarks for the fourth and every additional child when it starts going to school as a school allowance (einschulungsbeihilfe). Furthermore the fourth and every additional child receives a clothing allowance when joining the 'jungvolk,' or BDM. These allowances are conditional on the parents having to provide for at least three children.

In an article dealing with hunger edema the *Bulletin de l'Académie royale de médecine de Belgique* 1942 it is stated that 48 patients suffering from this disease visited the hospital. The protein osmotic pressure varied between 12 and 35 cm. In 77 per cent of the cases an abnormally low percentage of assimilation was evident. Bradycardia was a frequent appearance, the lowest pulse rate was 38. Diuresis usually set in once the patient was in the hospital. The protein osmotic pressure hardly alters after the edema has disappeared. Relapses are frequent when the patients leave the hospital and could be avoided only if the food supply was improved.

According to Transocean France of March 16, 2,000,000 Frenchmen have died as victims of venereal disease in France during the last ten years and some 5,000,000 Frenchmen are suffering from syphilis today according to statements made by the director of the Prophylactic Institute of Paris, Dr. Arthur Wernes, in an interview granted to *Paris Soir*. Dr. Wernes declared that during the last three years alone infections have trebled. The nation's life now depends on the effective combating of venereal disease which is vitally threatening the French population.

NPD of March 15 reports from Hamburg that the Asid Serum Institute in cooperation with Prof. Dr. Kuster of Leipzig has discovered a new means of combating infectious diseases.

It is the blood lost by mothers in childbirth which has not heretofore been put to any use. This new serum, 'Homoseran Asid,' is produced by blending the blood of many thousands of mothers. It is then preserved and its quality examined by the state office for testing immunization serums. So far only Germany has succeeded in making use of this serum provided by nature. The serum can also be used for blood transfusions without regard to the blood group of the donor or the patient.

According to Radio Paris of March 15 the French Corporative Health Group has made interesting suggestions to the public authorities relating to the work of doctors, chemists and dentists. These plans include the completion of one year's effective rural service, of which six months would be spent in social agricultural service by students in the categories mentioned. A second year for continuing study would be combined with social service in factories assisting doctors of big concerns.

The *Reichsgesetzblatt* of March 16 publishes the regulation for the protection of marriage, the family and motherhood dated March 9, to take effect a fortnight after publication. It was also to apply in the incorporated eastern districts. Paragraph 3 says: *inter alia* that whoever refuses assistance to the woman bearing his child will be liable to imprisonment. She may need help during pregnancy or at the birth, and without it her life or that of the child may be in danger. Paragraph 7 reads: Whoever manufactures, advertises or sells means or objects intended to prevent or interrupt pregnancy or prevent venereal diseases purposely or contrary to regulations will be sentenced to imprisonment for up to two years. Paragraph 9 reads: The reich minister of the interior will regulate the manufacture, advertisement and sale of means and objects for the prevention or interruption of pregnancy or the prevention of venereal diseases.

The *Deutsche Zeitung in den Niederlanden* of March 8 states that in answering the call of the SS-Ersatzkommando, 35 Dutch voluntary auxiliary nurses met at the Hague on March 6, before their departure for Donimeren where they will take a theoretical course of training. Obersertführer Dr. Reuter, German Red Cross deputy in the Netherlands, addressed the girls, who after completing the theoretical training, will have a practical hospital training before joining the German Red Cross.

According to a short wave broadcast from Berlin April 5 Professor Finsterer of Vienna has successfully performed several operations in which the stomach was completely removed and the intestine sewed to the esophagus. It is reported that these patients still retain the normal sensation of hunger, and that therefore the scientific assumption of hunger pangs originating in the stomach is false.

Hit View's van den Dag Netherlands of March 8 gives the following categories of persons who will be considered for vitamin C tablets which will be supplied by the Government Office for Food Supply in Wartime: (a) Pupils in elementary schools will receive three 50 gram tablets a week. (b) Young and expectant mothers who produce a doctor's certificate saying that they are in their fifth month of pregnancy can get seventy-two tablets of 50 Gm each. This also applies to young mothers who have a child which was born between Dec. 1, 1942 and March 28, 1943. (c) Certain groups of laborers will in agreement with the enterprises by which they are employed be supplied with tablets for a temporary period. (d) If possible the tablets will also be supplied to very young children. A further announcement will follow.

The *Bulletin de l'Ordre des Pharmaciens* Belgium of March 7 states that insulin is very scarce and that there is also a shortage of tubes. Consequently diabetic patients will soon be unable to obtain insulin. Chemists should therefore do their utmost to collect the tubes.

ORGANIZATION SECTION

OFFICIAL NOTES

COMMITTEE ON AMERICAN HEALTH RESORTS RECOMMENDS THAT WORD "CURE" BE AVOIDED

The Committee on American Health Resorts has authorized publication of the following statement

W. W. BACER, MD

The word "cure," analogous to the German "kur," has become traditional in connection with health resorts. "Cure" is a word which the American people associate with complete relief from disease or from symptoms, whereas the same word as used in health resort terminology refers rather to the program and procedure involved in treatment, that is, to the method, not the result. The Committee recognizes that traditional use of words cannot be modified arbitrarily, but the Committee cannot allow the impression to be fostered that complete relief from disease or from symptoms will necessarily result from health resort treatment. The Committee recommends that the use of the word be avoided whenever possible.

For the present the Committee will require that, in the printed matter issued by American health resorts listed under the Committee's rules, the word "cure" shall always appear in quotation marks except in instances in which its significance actually and justifiably is that of complete relief from disease or the symptoms thereof. The first occurrence in any piece of printed matter of the word "cure" shall, in addition to quotation marks, bear an appropriate reference mark and a footnote which shall read:

"Cure" means a treatment program at a health resort and does not refer to the eradication of the medical condition.

DOCTORS AT WAR

The first radio broadcast of Doctors at War by the American Medical Association in cooperation with the National Broadcasting Company and the Medical Department of the United States Army and the United States Navy will be heard on Saturday, June 19, at 5 p. m. Eastern War Time (4 p. m. Central War Time, 3 p. m. Mountain War Time, 2 p. m. Pacific War Time). An exception is the Chicago area, where the broadcast will be heard by transcription at 10:30 p. m., Saturday, over Station WMAQ.

The June 19 program is entitled "Report to America." On this program will appear two Army medical officers broadcasting by short wave from two foreign theaters of war, one Navy officer broadcasting from a foreign theater and one Navy officer broadcasting from a home base. The names of these officers and their locations are not divulged in advance for military reasons. For the same reason their subjects will not be announced.

SUMMER HEALTH HINTS

The next three programs for the new series of broadcasts to be given over radio station WLS Thursday afternoons at 2:45, Central War Time, under the title "Summer Health Hints" will be as follows:

June 17 "Safety in Swimming"

June 24 "Sunburn—Tan—Freckles"

July 1 "Heat and Sun"

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status—S. Res. 74 has been reported to the Senate, proposing to authorize the Senate Committee on Education and Labor, or a subcommittee thereof, to make a full and complete study and investigation, in cooperation with such public and private agencies and such persons as it might see fit to consult regarding the distribution and utilization of medical personnel, facilities and related health services. H. R. 2664 has passed the House and Senate, a bill to provide for the training of nurses for the armed forces, governmental and civilian hospitals, health agencies and war industries through grants to institutions providing such training.

Bills Introduced—S. 1161, introduced by Senator Wagner, New York, for himself and Senator Murray, Montana, and H. R. 2861, introduced by Representative Dingell, Michigan, propose to create a Unified National Social Insurance System to provide, among other things, temporary and permanent disability benefits, maternity benefits and medical and hospitalization insurance benefits.

STATE MEDICAL LEGISLATION

Alabama

Bill Introduced—S. 168 proposes the submission to the voters of an amendment to the state constitution authorizing the legislature to appropriate such portion of the surplus of the proceeds of the state income tax as it deems advisable for the purpose of public health and public welfare, including old age assistance.

California

Bills Enacted—A. 667 has become chapter 779 of the laws of 1943. It amends the health and safety code by, among other things, adding thyroid to the list of drugs which may be sold only on the written prescription of a member of the medical, dental or veterinary profession who is licensed by law to administer such drug and by prohibiting the sale of any drugs, medicines or other substances intended to be used for the cure or treatment of gonorrhea, syphilis, chancroid, lymphogranuloma inguinale or granuloma inguinale except on written order of a duly licensed physician. A. 1287 has become chapter 883 of the laws of 1943. It amends the education code by authorizing boards of education to grant health and development certificates to persons holding a certificate of registration as an audiometrist issued by the state board of public health, by providing that the qualifications of an otologist shall be a physician's and surgeon's certificate and a health and development certificate, by providing that the qualifications for an audiometrist shall be a certificate of registration as an audiometrist issued by the state board of public health and a health and development certificate, and providing that no otologist or audiometrist shall be employed or permitted to supervise the health and physical development of pupils unless he holds a health and development certificate.

Florida

Bills Introduced—S. 595 proposes that the responsibility for the enforcement of laws relating to public health and to the practice of medicine, surgery, chiropractic, naturopathy, nursing,

ing and midwifery shall rest on all law enforcement officers of the state of Florida and the counties thereof and on the state board of health acting through its duly appointed agents. S 596 proposes to require every holder of a license to practice medicine, pharmacy, osteopathy, chiropractic, naturopathy, nursing, midwifery or any other medical or material method of the practice of the healing art to record his license in the office of the clerk of the circuit court of the county in which he intends to practice and to obtain a certificate of registration annually from the secretary of the state board of health. The fee for such annual certificates shall be \$1. S 621 proposes to define a public hospital as one which enjoys an immunity or exemption from the payment of taxes or which contracts with the state of Florida or with any county or municipality therein for the hospitalization, care or treatment of indigent or other persons referred to the hospital by any public authority. The bill then proposes that in the management of any such hospital no discrimination shall be made against practitioners of any regular school of medicine and surgery recognized by the laws of Florida and all such regular practitioners shall have equal privileges in treating patients in said hospital. The patient shall have the right to employ at his or her own expense, his or her own physician and when acting for any patient in such hospital the physician or surgeon employed by such patient shall have exclusive charge of the care and treatment of such patient and nurses therein shall as to such patient be subject to the directions of such physician, every licensed physician residing in the county where such hospital is situated shall automatically by virtue of his residence therein and his license to practice, be and continue to be on the staff and a member of the staff of such hospital and so long as his right to practice medicine in Florida remains unrevoked he shall not be demoted or removed from said staff nor declassified to an associate membership, or otherwise deprived of any of the honors, rights and privileges of full membership on the staff. Finally, the proposal would authorize any physician who has been discriminated against to sue the hospital and recover therefrom at the rate of \$50 for each day the discrimination continues.

Bills Passed—S 580 passed the senate, May 21. It proposes that the several colleges and universities located and operating in the state of Florida be authorized directed and required to waive the last two semesters of preparatory college work required for entrance to the various professional schools operated by them in all instances where the applicant for admission and study in such professional colleges has completed all preparatory college work required for such admission except two semesters or less of study in the preparatory subjects and where such applicant has failed to complete his or her last two semesters or less of preparatory study by reason of his or her having been inducted into any branch of the armed forces of the United States during or after the month of January 1940. S 641 passed the senate, May 25. To amend the medical practice act, it proposes that the clerk of the circuit court shall not accept for recording and shall not record any license to practice medicine dated after the effective date of the act unless the same has been presented to him for recording on or before sixty days after the date of the license and provided further that no license to practice medicine dated prior to the effective date of the act may be recorded by the clerk of the circuit court unless it has been presented to him for recording on or before the expiration of six months from and after the effective date of the act or within sixty days after the date of recertification thereof by the board of medical examiners. S 653 passed the senate May 26. It proposes that the disablement or death of an employee resulting from an occupational disease shall be treated as the happening of an injury by accident and the employer's liability for the payment of compensation, medical and other benefits under the Florida workmen's compensation law shall be extended to such diseases. The proposal then lists twenty-four diseases which are to be deemed occupational in nature.

Illinois

Bills Introduced—S 525 to amend the medical practice act proposes that students matriculating or entering on a medical course during the years 1942, 1943 and 1944 may take a course the elapsed time of which is not less than thirty-six months

rather than forty months as previously required. The purpose of this proposal is to enable graduates of accelerated medical schools to obtain licensure in Illinois. S 551 proposes the appointment of a committee to investigate chronic diseases among indigents with the duty, among others, to make a complete and thorough survey of the number of persons in Illinois in indigent circumstances who are afflicted with chronic diseases not already provided for in existing state institutions and who require hospital care at public expense. H 760 proposes circumstances under which the voters of a county may vote on the proposition of whether or not the county should provide for the treatment of persons afflicted with cancer or tumor.

Massachusetts

Bill Introduced—H 1791, to amend the law relating to the registration of nurses, proposes that during the existing war applicants for registration need only be 20 rather than 21 years of age.

Bill Enacted—H 1519 has become chapter 233 of the laws of 1943. It provides that hospital records shall be admissible as evidence in a court so far as they relate to the treatment and medical history of a case and authorizes a court to admit photographic or microphotographic copies thereof in evidence.

Missouri

Bill Introduced—H 575, proposing to amend the criminal law concerning abortions by eliminating therefrom an existing proviso exempting instances in which an abortion or miscarriage was procured in order to preserve the life of the mother or unborn child when such action was necessary in the opinion of a duly licensed physician, was amended in the house so as to exempt the performance of an abortion when the same is necessary to preserve the life of the woman or that of an unborn child or if the person performing same is not a duly licensed physician, unless the said act has been advised by a duly licensed physician to be necessary for such a purpose.

Nebraska

Bills Enacted—Bill No 139 was approved, May 25. It amends the law regulating the practice of medicine and surgery by providing among other things that (1) persons serving an internship in an accredited hospital shall be exempt from the provisions of the law, (2) osteopathic licentiates shall be exempt from the law so long as they do not represent themselves to be physicians and surgeons or profess or hold themselves out to administer or prescribe drugs in any form or perform operative surgery with instruments or practice obstetrics, (3) chiropractic licentiates shall be exempt from the provisions of the law so long as they confine their practice to the treatment of human ailments by the adjustment by hand of any articulations of the spine, (4) any limited licentiate shall be exempt from the law so long as he confines himself strictly to the field for which he is licensed and does not hold himself out as administering or prescribing drugs in any form or performing operative surgery or practicing obstetrics and (5) an approved medical school may now give the required four courses of lectures or eight months each without the limitation that no two of such courses be held in one year, the amendment providing merely that no two such courses shall be held concurrently. The bill further provides that any person now licensed to practice osteopathy in the state of Nebraska may if application is made prior to July 1, 1948 take the regular examination given before the board of examiners in medicine and surgery and if successful he shall receive a license to practice medicine and surgery in the state of Nebraska provided however that any doctor of osteopathy now licensed and practicing in the state of Nebraska who is able to show satisfactory evidence of having taken and successfully passed the regular examination in medicine and surgery shall be issued a license hereunder on payment of the prescribed fee. Bill No 334 was approved, May 24. It prohibits the sale and distribution of any material or substance containing live micro organisms which are pathogenic to human beings except pursuant to a permit issued according to rules and regulations promulgated by the director of health or the state veterinarian.

TIES, LAW, HOSPITALS, EDUCATION, AND PUBLIC HEALTH)

ARIZONA

State Medical Election—Dr. Dan I. Milhoney, Tucson, was chosen president-elect of the Arizona State Medical Association at its annual meeting, April 30, and Dr. Otto F. Utzinger, Riverview, was installed as president, other officers are Drs. Florence H. B. Yount, Prescott, vice president, Frank J. Milloy, Phoenix, secretary and Clarence L. Yount, Prescott, treasurer.

CALIFORNIA

State Medical Election—Dr. Lowell S. Gorn, Los Angeles, was chosen president-elect of the California Medical Association at its annual meeting in Los Angeles in May and Dr. Karl I. Schupp, San Francisco, was installed as president. Dr. George H. Kress, San Francisco, was reelected secretary-treasurer.

Health Officer's Manual Recommended for Spanish Publication—The chief of publications, press division, Coordinator of Inter-American Affairs, plans to finance the translation into Spanish of the Health Officer's Manual by Dr. Jacob C. Gager, San Francisco. The volume has already been translated by Dr. Oswaldo Cisneros Santiago, who proposes to publish it under his direction as a publication of the Dirección General de Sanidad of the Chilean government.

Corporation with Fictitious Name Cannot Employ Physicians—In an opinion April 23, the attorney general ruled that a physician may not operate a liquor enterprise establishment under a fictitious name and that it is not legal for a corporation using a fictitious name, to hire a physician as its manager. The opinion to the board of examiners in Sacramento stated that under the law a corporation cannot practice medicine or surgery directly or indirectly, hence it cannot get a license to practice, according to the *Los Angeles Times*.

Personal—Dr. Earl H. Coleman has been appointed city health officer of Fresno to succeed the late Dr. Carlton Mathewson. Dr. Coleman will serve on a part time basis. —James G. Stone, Los Angeles, executive secretary of the Los Angeles Tuberculosis and Health Association, was to join the administrative staff of the National Tuberculosis Association on April 15. —Lloyd F. Webster, Los Angeles, has been appointed director of health activities for the Los Angeles County Board of Education.

New Dean at University of Southern California—Dr. Burrell O. Raulston, professor and head of the department of medicine and director of clinical teaching since 1930, has been appointed dean and professor of bacteriology at the University of Southern California School of Medicine, Los Angeles. Dr. Seely G. Mudd has resigned as dean but will continue as professor of experimental medicine. Dr. Raulston was born in Jefferson City, Tenn., in 1887. He graduated at Rush Medical College in 1915. He subsequently served on the staff, first as instructor in pathology and later as assistant clinical professor in medicine.

CONNECTICUT

Personal—Brig. Gen. James Stevens Simmons, M. C., U. S. A., director of the preventive medicine division of the Office of the Surgeon General, U. S. Army, has been appointed lecturer in public health on the staff of the Yale University School of Medicine, New Haven.

School to Study Alcoholism—A six week session of a school of alcohol studies at Yale University has been announced in the *New York Times*. It will be sponsored by the scientists of the Yale Laboratory of Applied Physiology, of which Dr. Howard W. Haggard, New Haven, is director, and will enroll seventy-five educators, social workers, clergymen and enforcement officers. The school will open on July 8 and continue through August 18 under the direction of Elvin M. Jellinek, M. Ed., of the laboratory of applied physiology. He will be assisted by an advisory staff and faculty equipped to give opinion on the legal, medical, social and educational aspects of alcohol problems.

GEORGIA

Rapid Treatment Center—An allocation of more than \$262,000 has been approved by the Federal Works Agency to purchase land, buildings and equipment and finance alterations to the existing buildings on Oatland and White Marsh islands near Savannah for the establishment of a rapid treatment center for women infected with venereal diseases. According to the *Military Surgeon*, the center will be operated by the public health service with funds obtained from the Federal Works Agency under the provision of the Lanham act.

State Medical Meeting and Election—Dr. Cleveland Thompson, Millen, was chosen president-elect of the Medical Association of Georgia at its annual meeting in Atlanta, May 11-14, and Dr. William A. Selman, Atlanta, was installed as president. Dr. Edgar D. Shanks, Atlanta, was chosen secretary-treasurer for the eighth term. The ninety-fourth annual session of the state medical association was held at the Baltimore Hotel and speakers on the scientific session included Rear Admiral Ross F. McIntire, surgeon general, U. S. Navy, who delivered the Abner Wellborn Calhoun Lecture on "Medical Achievements in This Present War", Drs. Chauncey C. Maher, Chicago, "Complications of the Acute Coronary Thrombosis" and James H. Means, Boston, "Practical Points in the Diagnosis and Treatment of Graves' Disease". Dr. James E. Paulin, Atlanta, President of the American Medical Association spoke on "The Role of the Medical Profession in the Present War".

ILLINOIS

State Medical Election—Dr. Everett P. Coleman, Canton, was chosen president-elect of the Illinois State Medical Society at the annual meeting in Chicago in May and Dr. George W. Post, Chicago, was installed as president, other officers are Drs. Robert S. Berghoff and Wade C. Harker, Chicago, vice presidents, and Harold M. Camp, Monmouth, who was reelected secretary-treasurer.

Chicago

Meeting of Bacteriologists—Dr. Ludvig Hektoen was the principal speaker at the spring meeting of the Society of Illinois Bacteriologists at the Chicago Women's Club on May 21. His subject was "Fragments of the History of Bacteriology in Chicago".

Chicago Given Safety Award—The grand award of the National Safety Council for 1942, presented to Mayor Kelly on May 20, symbolizes the winning by Chicago of first place in the national safety contest for 1942 and was made on the city's reduction of traffic deaths below the average of the preceding three years and on general accident prevention efforts. A total of 466 persons died from traffic accidents in Chicago in 1942 as compared with 623 in 1941.

Medical Service Plans Council—At a luncheon session of the Medical Service Plans Council of America in the Palmer House, June 6, Mr. A. M. Simons, staff associate, Bureau of Medical Economics, American Medical Association, was the guest speaker on "Evolution of Medical Service Plans". At the afternoon session "Authorization of Payments for Services in Administering a Medical Service Program" was discussed by Drs. Norman M. Scott, Trenton, N. J., Medical-Surgical Plan of New Jersey, George F. Moench, Hillsdale, Mich., of the Kellogg Foundation and James C. McCann, Worcester, Mass., Massachusetts Medical Service.

Raymond Allen Named Dean of Illinois—Dr. Raymond B. Allen, executive dean of the Chicago Colleges of the University of Illinois, has been appointed dean of the medical school, effective September 1. He succeeds Dr. David J. Davis, who is retiring. Dr. Allen will continue in his present position of executive dean of the Chicago departments, which include the colleges of medicine, dentistry and pharmacy and other institutions associated with these units. Dr. Allen graduated at the University of Minnesota Medical School, Minneapolis, in 1928. From 1934 to 1936 he was associate dean in charge of graduate studies at the College of Physicians and Surgeons of Columbia University and associate director of the New York Post-Graduate Medical School and Hospital at Columbia from 1933 to 1936, when he became dean of Wayne University College of Medicine, Detroit. In 1939 he came to the University of Illinois.

LOUISIANA

New Professor of Pathology—Dr. Granville A. Bennett, associate professor of pathology, Harvard Medical School, Boston, has been appointed professor of pathology and bacteriology at Tulane University of Louisiana School of Medicine, New Orleans.

Institute of Mental Hygiene and Guidance Center—The New Orleans Institute for Mental Hygiene recently dedicated its new home at 1737 Prytanis Street. Rev. Thomas V. Moore, O.S.B., professor of psychology at the Catholic University of America, Washington, D.C., spoke on 'The Child Guidance Center and Its Service to the Community' and Robert L. Sutherland, Ph.D., director of the Hogg Foundation, University of Texas, Austin, Texas, 'Social Gains in Wartime.' The new home is an old residence of seventeen rooms which has been renovated by the city of New Orleans. Dr. Martha G. W. MacDonald, who has been director of the clinic since its beginning, is on leave of absence as psychiatric consultant for the Children's Bureau, Department of Labor, Washington, D.C. During her absence the consulting services of a number of neuropsychiatrists in the community have been available and Dr. Milton E. Kirkpatrick, New York, director of the division on community clinics of the National Committee for Mental Hygiene, has intermittently spent helpful periods at the clinic. The New Orleans Institute for Mental Hygiene, which sponsored the Guidance Center, was founded in 1938 by a gift of Mr. Samuel Zimurray; its affairs are administered by a private board which directs the policies of the clinic and employs the professional personnel. Prior to occupying its new quarters the clinic was housed in the Tulane University Medical School Building. The Guidance Center seeks to make available specialists for consultation concerning educational, social and emotional development of normal children. In 1939, the first year of operation of the clinic, 375 children were given service. 366 children were handled the following year and 314 in 1941.

MARYLAND

State Medical Election—Dr. Jacob W. Bird, Sandy Spring, was elected president of the Medical and Chirurgical Faculty of the State of Maryland at its recent annual meeting in Baltimore in April. He will take office on Jan. 1, 1944. Dr. William H. Toulson, Baltimore, is the secretary. The next annual meeting will be at Baltimore, April 25-26, 1944.

MASSACHUSETTS

Dr. John Downing Named Professor of Dermatology—Dr. John G. Downing, Boston, assistant professor of dermatology at Tufts College Medical School since 1932, has been appointed professor of dermatology and head of the department at Boston University School of Medicine. Dr. Downing was also recently named dermatologist and chief of the dermatologic service at Massachusetts Memorial Hospitals. Dr. Downing graduated at Harvard Medical School in 1915. He served in the U.S. Navy, 1917-1921, during part of which time he was medical officer of the U.S. Naval Hospital in Chelsea. He is consultant to the U.S. Public Health Service and the U.S. Veterans Administration and also president of the New England Dermatological Society.

MICHIGAN

Henry Russel Award—Dr. Carl Alfred Moyer, assistant professor of surgery at the University of Michigan School of Medicine, Ann Arbor, was recently presented with the annual Henry Russel Award given to a member of the university for outstanding work. Dr. Moyer's research was on the physiology of breathing and the effect of various drugs on the respiratory processes. He graduated at the university in 1937.

Hospital for "War Worker Patients"—An unused three-story building at the Dr. William J. Seymour Hospital, Eloise, has been leased by the Wayne County Board of Supervisors to a private organization of citizens who will operate it as a general hospital for the use of war worker patients of the medical practitioners in the western part of the county. The action followed a survey by the local procurement and assignment committee in cooperation with the Wayne County Medical Society showing that an acute population problem existed in the western half of the county, which is mostly rural and showing a population increase from 97,000 to 141,000. The county as a whole has 1 general hospital bed for every 311 people but the western section has only 1 for every 1,468 persons. When the newly acquired building at Eloise is in operation about 100 more beds will be added to the present 96. The building will be leased to a nonprofit group of interested citizens known as the People's Community Hospital Inc. The corporation will contract to arrange for the organization of a medical staff and administrative personnel. By leasing the building outright and charging for services as an independent contractor, the county or Wayne is thus kept distinctly out of the field of private hospitalization, it is announced.

Opening as Director of New County Health Department—The Civil Service Commission of Wayne County announces that applications are now being accepted for the position of director of the recently established county department of health. The salary will be \$7,000 a year to start and applications, which may be obtained from the civil service commission, 521 County Building, Detroit, must be delivered to the office of the commission on or before 4:30 p.m. in Tuesday, July 6, or be postmarked before midnight of that date. The Wayne County board of supervisors recently established a health department to provide public health services throughout the county in both indigent and nonindigent cases, except that it shall not have jurisdiction in nonindigent cases in cities having an organized health department with full-time health officers, except that such cities may elect to join with the county in the organization. The director selected will be expected to organize and develop as well as to administer a comprehensive program of health services in the county. The examination will be unannounced and candidates will be rated on the basis of experience and training in the field of public health. Candidates may be required to appear at their own expense for an oral interview. Successful candidates for the position of director of health must have received the degree of doctor of medicine from a recognized medical school and must have satisfactorily completed at least one year in residence in the study of preventive medicine at a recognized university school of public health. They must have had at least one year of clinical experience, preferably in a hospital or acceptable standards, including, preferably three months work in pediatrics and a similar period in infectious diseases. In addition the candidates must have had at least six weeks of field experience in an established state or local department of public health. Eligibility for medical licensure in the state of Michigan at the time of appointment is required. Exceptions to the foregoing standards will be made only for candidates who have, through experience and practical training, proved ability to perform successfully the duties of the position. The examination is open to any qualified citizen of the United States.

MISSOURI

State Society Gives Full Support to Hygeia—The Missouri State Medical Association in a resolution adopted at its annual meeting in St. Louis, April 18, gives full support and complete cooperation to its Woman's Auxiliary in the efforts to disseminate health information through *Hygeia*, the Health Magazine. Recognizing the great public need for reliable health information and in recognition of the service that *Hygeia* can perform in terms of industrial, civilian and community health, through the resolution the house of delegates of the association endorsed the publication and recommended that officers and members of the county medical societies of the association urge wider recognition of it in their communities. The resolution also urged the introduction of *Hygeia* in war industries, army camps, U.S.O. centers, reception rooms or physicians and dentists and among their patients, parent-teacher organizations, private clubs and other community centers.

NEBRASKA

State Medical Election—Dr. Floyd L. Rogers, Lincoln, was chosen president-elect of the Nebraska State Medical Association at its annual meeting in May. Dr. Albert L. Cooper, Scottsbluff, was installed as president. Dr. Roy B. Adams, Lincoln, is the secretary-treasurer. The 1944 session will be held in Omaha sometime in May.

NEW HAMPSHIRE

State Medical Election—Dr. James W. Jameson, Concord, was elected president of the New Hampshire Medical Society at its recent annual meeting in Manchester in May. Dr. Fred Fernald, Nottingham, was named vice president and Dr. Carleton R. Metcalf, Concord, was reelected secretary-treasurer.

NEW JERSEY

Medal Awarded to Dr. Conklin—The John J. Carty medal and award for the advancement of science awarded at the annual dinner of the National Academy of Sciences, April 26, was presented to Edwin Grant Conklin, Sc.D., The citation read: Zoologist, Cytologist and Embryologist, Philosopher, Teacher and Scientist. Student of Life and of Growth from Lowest Beginnings to Highest Consummation. Dr. Conklin received his doctor of philosophy degree from Johns Hopkins

University, Baltimore, in 1891 and an honorary degree of doctor of science from the University of Pennsylvania in 1908. He has been lecturer in biology at Princeton University since 1934 and president of Science Service since 1937.

NEW YORK

Physician's Acceptance of Deanship Postponed Because of Illness—Dr. Charles Oberling, pathologist of the Mary Imogene Bissett Hospital, Cooperstown and director of the Otsego County Laboratory, who recently accepted an invitation from the Iranian (Persian) government to be dean of the Medical Faculty of the University of Teheran and to act as medical adviser to the Iranian government in public health and hygiene, reached Buenos Aires and had to turn back to this country because of illness. Dr. Oberling, in accepting the appointment, was said to represent the national committee of the United States. The *New York State Journal of Medicine* reported that Dr. Oberling had already spent two years in Iran helping the government to reorganize its medical services.

Commission Named to Study Mental Hygiene Hospitals—Governor Dewey on May 26 announced the appointment of a five member Morrell Act Commission to formulate a long range program for the improvement of the state's mental hygiene hospitals. The commission is the first of its kind ever appointed under the Morrell Act and will be headed by Archie O. Dawson, lawyer, who recently completed a Morrell Act investigation of conditions at the Creedmoor State Hospital. Other members of the commission are:

Lee H. Muller, assemblyman, Cornwall, chairman of the state health department commission and superintendent of Cornwall Hospital.

Dr. Peter Hays, New York, secretary of the Medical Society of the State of New York.

Dr. Fraser H. McNeely, Kenmore, medical superintendent of the Buffalo General Hospital and vice president of the American College of Hospital Administrators.

Charles G. Russell, New York, assistant director and consultant on accounting of the United Hospital Fund.

According to the *New York Times*, Governor Dewey stated that the inquiry will not be of an "inquisitorial" nature and that the commission will undertake the constructive task of improving the mental hospitals and curing conditions in the mental hygiene department described by Mr. Dawson in his Creedmoor report, which suggested evidence of long-standing deterioration and breakdown in the department of mental hygiene.

New York City

Society Recommends Plan for Medical Care—The committee on medical economics of the Medical Society of the County of New York has issued recommendations pertinent to a plan for medical care. The recommendations have been adopted by the committee members of the society and, if accepted by representatives of the city government, would provide medical services at nominal rates for persons of low incomes and establish a central municipal registration bureau. The entire program would be conducted by a nongovernmental, nonprofit agency or corporation, set up with the cooperation of the city government with the board of directors one third city officials, one third physicians selected or appointed by the five county medical societies of Greater New York and one third by prominent laymen acceptable both to physicians and to government representatives. It also was recommended that the medical members shall constitute the medical policy committee and that there shall be no change in the medical policy without its consent. Other recommendations were that the premium charged shall be such that the physician shall receive \$2 per house visit and \$1 per office visit (to be adjusted at the discretion of the policy committee), that a panel shall be established and patients in their districts shall consult its members, that all licensed doctors of medicine may register for the panel and that special fees for other medical consultants will be set up with due regard to the costs and solvency of the plan. A paid physician would be chief executive of the corporation and the hours for receiving panel calls would be from 8 a. m. to 8 p. m. except in case of emergency. It is also provided that physicians on due notice should have the right to refuse emergency patients and that the patient may change physicians if he desires.

Report on Experiment in Voluntary Health Insurance—A report on the first two and one-half years of the functioning of the Corlears Hook Medical Association, an experiment in voluntary health insurance among low income families which began in June 1940, was released on April 22.

Dr. Morris A. Brand is medical director of the plan, which operates in a slum clearance project in the lower east side of Manhattan, inhabited by 1,771 families, of which 1,000 families are entitled to free care in the city's clinics and are also qualified for membership in the plan because of similar scales of income eligibility. The report states that the results during the two and one-half years of the plan's existence show that a large number of families in the low income groups, despite their eligibility for free city medical services, prefer to pay for their own medical needs provided they are not beyond their means. The study also revealed, it was stated, that such a plan would save considerable funds to the city, lower the demand on the city's hospital facilities and also add a new source of income to physicians in the neighborhood who become members of the plan. The experiment seems to prove that this low income group wants a medical service plan and must have it on a substandard fee basis, it was stated. This was shown by a voluntary enrollment of 45 per cent of those eligible, the decrease in the use of the ambulance from 800 trips in one year prior to enrollment to 148 trips in the first one and a half years as members, by the increased use of the doctor in the home and office, and by the decrease of visits to clinics from 2,816 to about 1,000 in one year for diagnostic and therapeutic facilities at the request of panel physicians. It has been further determined that these people are willing to pay what they can, as shown by the payment of \$8,300 during the two and a half years of enrollment, which started without subscribers and rose to an average of 500 families per month. In addition, they paid the expense of medication which a large number of them formerly obtained free of cost in the clinics. They were willing to do that to enjoy private care. Physicians recognize the need for some form of medical service plan and are willing to accept an equitable fee for their services, as manifested by the willingness of neighborhood physicians to serve on the panel. The physicians and the administrative board of the association recommended an increase in the doctor's fee for any future plan it was stated. It has been determined that the diagnostic and therapeutic facilities of a hospital and its clinics can be integrated with the services of the panel physicians.

NORTH DAKOTA

Personal—Dr. Earl M. Watson, health officer of Cass County, has been appointed health officer of Fargo, succeeding Dr. Elvin L. Sederlin, who resigned recently to become regional health officer of Valley City.—Drs. Frederick W. Fergusson, Kulm, and William H. Long, Fargo, were recently appointed members of the state board of medical examiners. Dr. William F. Sihler, Devils Lake, was reappointed to the board.

Twenty-Five Years of Ophthalmology—Dr. Tracy W. Buckingham, Bismarck, was elected president of the North Dakota Academy of Ophthalmology and Oto-Laryngology at the twenty-fifth annual session in Bismarck, May 10, and Dr. Frederick L. Wicks, Valley City, was reelected secretary. Speakers at the meeting included Drs. William L. Benedict, Rochester, Minn., on "A Critical Review of the Recent Proposed Treatments of Eye Diseases" and William T. Peyton, Minneapolis, "Brain Abscess."

SOUTH DAKOTA

Division of Public Health Education—The South Dakota State Board of Health recently established a division of public health education with Mr. I. R. Vaughn, assistant director of the division of vital statistics, in charge.

Dr. Cottam Named Superintendent of Health—Dr. Gilbert G. Cottam, Sioux Falls, has been appointed superintendent of the South Dakota State Board of Health to succeed the late Dr. John F. D. Cook, Pierre. Dr. Walvin R. Giedt, Vermillion, assistant state health officer and until Dr. Cottam's appointment acting superintendent, has resigned to become epidemiologist for the state health department of Washington.

VERMONT

Rehabilitation for the Tuberculous—The trustees of the Vermont Tuberculosis Association, Inc., have appropriated \$3,000, which will be matched by federal funds, to establish a special rehabilitation program for the tuberculous in the state. According to the *Bulletin of the National Tuberculosis Association*, the money will be expended under the supervision of the committee on rehabilitation of the association in consultation with the rehabilitation division of the state department of education and physicians in the state sanatoriums.

GENERAL

Pediatric Board to Hold Two Examinations—The American Board of Pediatrics announces that because of the large number of applicants two oral examinations will be held this fall one in New York, November 20-21, and the other in Cincinnati, December 11. A written examination will be held locally under a monitor, October 8.

Changes at Ciba Pharmaceutical Products—Dr Ernest Oppenheimer, formerly of New York has been chosen vice president of the Ciba Pharmaceutical Products, Inc. Summit, N. J. in charge of medical research, effective within a few months. Mr J. J. Brodbeck was recently elected president. Lee J. Perrin New York was elected chairman of the board of directors. Norman F. Storm vice president in charge of production and Vincent A. Burghier vice president in charge of sales.

Winners in Health Honor Roll Contest—The U. S. Chamber of Commerce and the American Public Health Association have announced the winners in their annual contest in community health promotion and preservation. More than five hundred and fifty communities participated. The thirteen winning cities are Milwaukee, Madison and Racine, Wis.; Detroit, Baltimore, Greenwich and Hartford, Conn.; Newton, Mass.; Reading, Pa.; Hackensack, N. J. and Peoria, Evanston and La Salle, Ill.; Oglethorpe, Ga. The twenty winning counties are Summit, Van Buren and Saginaw, Mich.; Davidson, Gibson and Memphis-Shelby, Tenn.; Fayette, Madison and Jefferson, Ky.; Lauderdale, Washington and Jones, Miss.; Olympia-Thurston and Whitman, Wash.; Arlington, Va.; Forsyth, N. C.; Glenn, Ga.; Gallatin, Mont.; El Paso, Texas and Santa Barbara, Calif.

Report of Blindness Prevention Group—The National Society for the Prevention of Blindness expended \$167,879 in 1942 to carry out its various activities. Chief on its projects were a glaucoma control demonstration and five eye clinics in New York from which the society expects to be able to formulate recommendations for a nationwide glaucoma control program. The report indicated that the society had intensified its industrial program brought about by the expansion of industry, increased employment of women and older men and steady acceleration in the production of war materials all of which have placed an additional burden on eyes. Working with industrial executives, safety engineers and others in establishing eye safety standards the society has formulated recommendations which, it followed according to the report, can not only increase efficiency and safety but will make greater manpower available through correction of defective vision among workmen who are otherwise able bodied.

American-Soviet Medical Society Formed—Dr Walter B. Cannon, professor emeritus of physiology, Harvard Medical School, Boston, is the president of the American-Soviet Medical Society, a new group founded to meet an increasing demand for information about the results and achievements of Soviet medicine. Dr Henry E. Sigerist, director of the Institute of the History of Medicine at Johns Hopkins University, Baltimore, is the editor of a journal to be published by the society and to be known as the *American Review of Soviet Medicine*. Temporary offices of the society are at 130 West 46th Street, New York. Through meetings, the publication of a journal and the establishment of a library of information, the society will tell physicians of America and members of the allied professions on what problems Soviet colleagues are working and what is being done to solve these problems. The society will also send American medical books and periodicals to the Soviet Union to keep the Russians informed of scientific developments in this country and to stimulate closer cooperation between the medical corps of the two countries. As soon as conditions permit after the war the society hopes to promote the exchange of students and scientists and to sponsor study hours in the two countries.

Special Society Elections—Dr E. Benjamin Gillette, Toledo, Ohio, was elected president of the Tri-State Medical Society of Indiana, Michigan and Ohio at its annual meeting in Ann Arbor recently and Dr Floyd R. Nicholas, Carter South Bend, Ind., was chosen vice president. Dr Oscar P. Klotz, Findlay, Ohio, is secretary and Dr Fredrick F. Yonkman, Detroit, treasurer. The 1944 convention will be in Toledo. —New officers of the American Institute of Nutrition chosen at a recent meeting in Detroit include Dr Howard B. Lewis, Ann Arbor, Mich., president; Irene G. Macy, Hoobler, Ph.D., Detroit, vice president; Arthur H. Smith, Ph.D., Detroit, secretary, and William H. Sebrell, Jr., Bethesda, Md., surgeon, U. S. Public Health Service, treasurer. —Dr Edwin G. Zabriskie, New York, was elected president of the American

Neurological Association at its sixty-ninth annual meeting in New York, May 7. Dr Henry Alsop Riley, New York, was re-elected secretary. The dates of the next meeting will be decided sometime in December. —Dr Karl M. Bowman, San Francisco, was chosen president elect of the American Psychiatric Association at its annual meeting in Detroit in May and Dr Edward A. Stricker, Philadelphia, was installed as president. Dr Winifred Overholser, Washington, D. C., was re-elected secretary-treasurer.

CANADA

Dr Dafee Dies—Dr Allan Roy Dafee, a country practitioner who attained worldwide renown through the birth of the Dionne quintuplets, died at a hospital in North Bay, Ont., June 2, aged 60. Dr Dafee died five minutes after he had been admitted to the hospital suffering from pneumonia. Born in Madoc, Ont., May 29, 1883, Dr Dafee graduated at the local schools and took his M.B. degree at the University of Toronto Faculty of Medicine in 1907, where he also received his M.D. degree in 1928. He had been carrying on the activities of a simple country doctor in the rural community of Callander but on May 28, 1934, after he had officiated at the births of the Dionne quintuplets, Dr Dafee became an internationally known figure. When he arrived at the Dionne home at 4 o'clock in the morning, two of the babies had been born and the third was arriving. Dr Dafee was given the Order of the British Empire by the king. In 1935 he was made an honorary member of the Toronto Academy of Medicine and in 1937 an honorary member of the Ohio State Bureau of Child Hygiene. He had also been medical health officer in North Hunsborough Township and an advisory editor of *Parents Magazine*. In 1942 Dr Dafee resigned as physician to the Dionne quintuplets.

LATIN AMERICA

Hospital News—The new Hospital Infantil of Mexico City was formally opened on April 30. General Manuel Avila Camacho, president of Mexico, presided. Among the speakers were Dr Federico Gomez, head of the Hospital Infantil who reviewed the history of the hospital and Dr Gustavo Baz, the secretary of public welfare.

Agreement to Develop Quinine Plantation in Guatemala—The development of the largest cinchona plantation in the Western Hemisphere under an agreement between Guatemala and United States agencies has been announced. The plantation, which is known as El Porvenir, has been controlled by German interests through the Central American Plantations Corporation but controlling stock of this corporation now is in the hands of the United States Alien Property Custodian and transfer of the property to Guatemala is being arranged. The agreement for development of the property has been worked out among the Guatemalan government, the plantation corporation and the United States Board of Economic Warfare. The agreement has been ratified by Guatemala's legislative assembly. How many cinchona trees are on the 17,000 acre plantation in the District of San Marcos has not been determined. A large part of the acreage is devoted to coffee. The property is near good roads and only 9 kilometers from the Pan American Highway. Bark may be trucked 35 miles to Ayutla on the Mexican border. From there it can move to the United States by rail. A laboratory has been established at El Porvenir for testing the bark. There will be studies as to the best trees, experiments with grafting and transplanting, and setting out of seed beds. Drying kilns have been set up. It takes only a fourth as much time to dry this way as by the old method of spreading out in patios. Several hundred people live on the plantation which is on the slopes of Tajumulco, Guatemala's highest mountain. The trees grow mostly at elevations of between 4,000 and 5,000 feet. The mountain rises to 14,000 feet.

CORRECTIONS

Prevention of Sulfadiazine Crystalluria—In the fourth line of the Current Comment by this title in *THE JOURNAL*, May 29, page 311, Gilligan and his colleagues should read 'Gilligan and her colleagues.' The author whose work was referred to in the March *Proceedings of the Society of Experimental Biology and Medicine* was Dorothy Rourke Gilligan.

Personality Changes Following Substitution Therapy—In the article by Dr Jacob Kasanin and Lieut. Col. Gerson R. Biskind entitled 'Personality Changes Following Substitution Therapy in Preadolescent Eunuchoidism' in *THE JOURNAL*, April 24, in the second line of the fourth paragraph of the first column on page 1319, the word 'diameter' should have been 'circumference.'

The Publicity Campaign Against Venereal Diseases

As shown in previous letters to *The Journal*, the increase in venereal diseases due to the war and the need to protect our fighting men have made the problem of prevention urgent, and the Ministry of Health has taken the unprecedented step of inserting advertisements in the press throughout the country pointing out the dangers and the action to be taken. The Central Council for Health Education has held a conference in London to discuss health education and venereal disease. The chairman, Dr. Charles Hill, said that the problem could not be effectively tackled until the curtain of secrecy which surrounded it was lifted. Mr. Ernest Brown, minister of health, stated that the public still had a prejudice against the subject being discussed by women which must be broken down. The defense regulation for compulsory treatment (described in a previous letter) was to stop a gap in the treatment service. The press campaign would continue to stress the principle "Clean living is the only way to escape infection." He urged local authorities to take full advantage of posters, leaflets, lectures and films provided by the Central Council for Health Education. The council has been officially recognized as the one agency responsible for the central provision and integration of health education, including venereal diseases. The archbishop of Canterbury, who is president of the council, regarded the problem as primarily a moral one. All that we can do to promote healthy family life, both by adequate housing and by help to parents in the wise upbringing of children, was of inestimable value. He criticized the method followed in the army, which systematically ignored principle and instructed recruits in the use of prophylactics, thus suggesting tormentation. What was primarily a moral problem was treated as if it were primarily a medical one. The sacredness of sex must be put first in our educational campaign. In the discussion which followed, some objection was taken to this view. A health officer, Dr. Maitland Radford, thought that a false antithesis between the religious and the secular approach had been suggested. Sex was not universally regarded as sacred. The secular approach allowed a wider attitude in sex behavior than did the religious. But those with different points of view could work together. The bulk of cases have been among homeless foreign sailors. Improvement in pay and prospects have altered the attitude of the men in the royal navy toward marriage, and most of them are married, but in the merchant service the men in many cases are without home ties. A surgeon, Mr. McAdam Eccles, was glad that the public at last was freely discussing a subject which for fifty years he had tried to bring to notice. Doctors were looking to the public to give strong support to an educational campaign.

Nonspecific Epididymitis

At a joint meeting of the Sections of Urology and Surgery of the Royal Society of Medicine Mr. E. G. Slesinger discussed nonspecific epididymitis. During the last fifteen months Mr. Slesinger and his colleagues have seen 34 cases in the fighting services. The average age of the patients was 38.8 years. The symptoms were pain and swelling. In 19 the pain came first, in 8 the swelling and in 7 the pain and swelling came together. In 3 cases the onset was gradual, but in others it was stated to have been sudden. Some of the patients were febrile throughout, but most showed a pronounced pyrexia for the first few days. None of the patients appeared to be generally ill. In all cases there was tenderness and this was acute in 3

The whole epididymis was enlarged in every case, and the vas was demonstrable in 16. The urine showed a little albumin in 12, and coliform organisms were seen in 3.

Treatment consisted in rest in bed with support of the testis, the patient being fitted with a suspensory bandage. Sulfapyridine and sulfathiazole were tried, but neither made the slightest difference to the condition. Three patients were operated on. The results in the other 31 could be grouped as (1) resolution in from three to six weeks, (2) resolution requiring some months. In the second group some residual thickening was left in the epididymis, but the majority could not be followed up.

Mr. Slesinger considered that this series represented something new in incidence. In the absence of evidence of breakdown and obvious tuberculosis elsewhere the epididymitis must be treated conservatively in the first instance. Operation was not essential in any of the 3 cases in which it was performed. The lumen of the vas seemed to be the route of the infection. It was not clear whether the urine alone could produce an epididymitis or whether infection of the urine was a necessary concomitant. If all the 34 cases were due to infection with pathogenic microbes, it was difficult to believe that none would have supplicated. If the passage of uninfected urine down the vas was accepted as the determining factor there was nothing to explain why it should occur with such relative frequency in the men in the fighting services as compared with the normal population in peacetime.

Czech Medical Degrees Conferred at Oxford University

A graduation ceremony without precedent in the history of Oxford University has taken place. In the presence of the president of the Czechoslovak republic the vice chancellor of the university at the request of the Czechoslovak government conferred degrees on Czechoslovak students who had completed their medical education in this country. As is the custom, the public orator's speeches of presentation were made in what was once the international language of Europe. He referred to the ceremony as *spectaculum tam novum tamque magnum* (a spectacle as novel as it was great) and to the spirit of the Czech people as *indomita haec gentis oppressae in rebus adversis constantia, gravitas, perseverentia* (indomitable constancy, dignity and perseverance of this oppressed race in the face of adversity).

The Medical Profession Demands the Pasteurization of All Milk

Pasteurization of milk is performed on a large scale but is not universal. A deputation of leading members of the medical profession asking that milk might be made safe by pasteurization or other heat treatment was received by the minister of food. Professor Picken, who represented the British Medical Association, said that the profession was satisfied that pasteurization was the only practical safeguard and that it had no serious disadvantages. Professor Garrod stated that bovine tuberculosis was a widespread menace and from 5 to 10 per cent of churn samples of raw milk were infected. Milk borne tuberculosis was estimated to cause two thousand deaths a year. The minister said that he would report what had been said to the government.

Economy in Bread Increased Consumption of Potatoes

In normal times Britain imports about two thirds of its food. The need to devote shipping as much as possible to war purposes has altered this procedure. Now we are producing as much food as we can and the growing of cereals and potatoes has enormously increased. The one important food which has not been rationed so far is bread. A great increase in the

consumption of potatoes has reduced the need for bread, but the Ministry of Food is now considering further steps. A complete record of bread production and consumption, which would be an essential preliminary to rationing is being made. The fact that people's needs vary much is an obstacle. Lord Woolton, the food controller, wants to see more potatoes eaten instead of bread. The army is to do this. New instructions permit a substitution in the daily ration on the basis of 3 ounces of potatoes for 1 ounce of bread and 4 ounces of flour for 1 ounce. The present daily allowance for soldiers at home is 10 ounces of bread with 2 ounces of flour.

BRAZIL

Epidemiology of Cancer

No comprehensive work has ever been published about the epidemiology of cancer in Brazil. The problem has been particularly considered in relation to Rio de Janeiro, the largest city, where some aspects of the incidence of cancer have been analyzed by Luiz Briggs by J. Barros Barreto and by J. P. Fontenelle. A new contribution, rather more complete, has just been published by Dr. Joaquim E. Alencar. According to the latest available statistical returns, referring to the largest cities in the year 1941, cancer as a cause of death ranks in the sixth place in São Paulo and Belo Horizonte, in the seventh in Rio de Janeiro, Curitiba and Porto Alegre, in the eighth in Curitiba, in the ninth in Belém, Salvador, Niterói and Campos, and in the tenth in Recife, Vitória, Aracaju, Florianópolis, Maceio, Fortaleza and Santos. Thus cancer is less important in the northern, tropical, cities than in the southern ones with a cooler climate.

Dr. Alencar points out that, in the southern cities where the amount of people of European descent is larger, the principal cities present death rates from cancer in positive correlation with the percentage of European stock in the population. For the period 1932-1941 the average crude death rate per hundred thousand was as follows: Niterói 47.9, Rio de Janeiro 55.2, Curitiba 62.7, São Paulo 74.1 and Porto Alegre 88.0. It is necessary to point out also that these cities have a cooler and cooler climate as one goes south from Niterói to Porto Alegre. The crude death rate from cancer is increasing in Rio de Janeiro as Dr. Alencar shows, by the following rates: 1902-1911 33.8 per hundred thousand, 1912-1921, 41.7, 1922-1931, 45.9 and 1932-1941, 55.2. For the last five years, 1938 to 1942 the progression has been 55.0, 59.0, 65.3, 66.4 and 67.3.

One of the most interesting parts of the study is that concerning the distribution of the deaths according to the localization of cancer. From the beginning Dr. Alencar points out the defective classification of the localizations of cancer used in the International List of Causes of Death, in the previous editions as well as in the Fifth Decennial Revision made in October 1938 in Paris and now in use in many countries, including the United States and Brazil. Part II of this list, concerning Cancer and Other Tumors, is divided into eleven titles (numbers 45 to 55) related to malignant tumors, the first ten with cancer of the different organs of the digestive and the respiratory apparatuses of the skin of the nervous system and of the genitourinary organs and the last one (number 55) to include cancer of other organs (adrenal gland, bones, thyroid gland, and nasal cavity and accessory sinuses) and also of unspecified organs. As the number of deaths remains undetermined for the various unspecified organs classified under title 55 the inclusion of these deaths beside those of the other titles would cause a complete disturbance of the true percentage distribution. One solution for this difficulty is to separate the deaths classified under title 55 from those of the other titles for which the number of deaths is correctly related to a

specified localization. Thus, out of the total of 9,264 deaths, only 8,307 (3,735 of males and 4,572 of females) may be studied according to the localization, as there are 957 deaths classified as "cancer of other organs and unspecified organs." Out of these 8,307 deaths (of both sexes put together) from cancer the localization of which is well determined 626 or 7.5 per cent, are of the buccal cavity and pharynx, 1,861, or 22.4 per cent, are of the stomach and duodenum, 2,144, or 25.8 per cent, are of other parts of the digestive apparatus, 582, or 7.0 per cent, are of the respiratory apparatus, 596, or 7.2 per cent, are of the genitourinary organs except the uterus, 1,692, or 20.4 per cent are of the uterus, 640, or 7.7 per cent are of the breast, and 166, or 2.0 per cent, are of the skin. The distribution is different if we consider either sex separately. The deaths from cancer of the buccal cavity and pharynx represent 12.4 per cent in males and only 3.6 per cent in females for the stomach and duodenum the figures are respectively 33.3 and 13.5 per cent, for the other parts of the digestive apparatus, 29.1 and 23.1, for the respiratory apparatus, 13.0 and 2.1, for the genitourinary organs except the uterus, 9.9 and 4.9, for the uterus, 37.0, for the breast, 0.1 and 14.0, and for the skin, 2.2 and 1.8. To go further on the question of the distribution of the localization of cancer Dr. Alencar transcribes the data for the 1,616 cases attended during the year 1941 at the Center of Cancerology of Rio de Janeiro under the direction of Dr. Mario Kroeft: buccal cavity and pharynx 282 cases, or 17.4 per cent, other parts of the digestive apparatus 54 cases, or 3.3 per cent, respiratory apparatus 82 cases, or 5.1 per cent, genitourinary organs except the uterus 86 cases, or 5.3 per cent, uterus 368 cases, or 22.8 per cent, breast 224 cases, or 13.9 per cent, skin 192 cases, or 11.9 per cent, and other localizations 328 cases, or 20.3 per cent.

Types of Meningococci in São Paulo

Working with sixty strains of meningococci isolated from the cerebrospinal fluid and identified by biochemical tests, Dr. Jose Carlos Rivas found the following types of agglutination tests carried on in a water bath at 37°C during two hours: type I, fifteen strains (25 per cent), type II thirty-eight strains (63 per cent), type III, ten strains (16.7 per cent), type IV, seven strains (11.6 per cent).

Accordingly in the immunizations for the preparation of the polyvalent therapeutic serum emulsions of living and recently isolated meningococci in which the strains of type II predominate and of other types in the proportions in which they are found are employed as antigen by the Butantan Institute at São Paulo.

Marriages

JOHN YOUNG TEMPLETON III, Mooresville, N. C., to Miss Dorothy Fraley at Richmond, Va., April 30.

DANIEL LAURENCE MAGUIRE JR., Charleston, S. C., to Miss Martha Dora Oliver of Oswego recently.

LOUIS EMMETT BROWN JR. to Mrs. Mary Alice Parramore Douthett, both of Abilene, Texas, April 2.

FRIEDRICH EIGENBERGER to Miss Cordelia Schrader, both of Sheboygan, Wis., at Kohler, March 20.

ROBERT HOLT GREEN, Charleston, S. C., to Miss Audrey G. Johnston at New York recently.

WENDELL DAVIS, Rochester, N. Y., to Miss Marian Donaldson at Spring Creek, Pa. recently.

JOHN DAVID POWELL, Stuart, Va., to Miss Mable Kathryn Minter of Martinsville recently.

CHARLES HIGHSMITH to Miss Virginia Brannin Adams both of Fayetteville, N. C., May 8.

WILLIAM CON TLEKER, Birmingham, Ala., to Miss Frances Hay at Fayette, April 11.

RAYMOND SHORT CAMP, Fairburn, Ga., to Miss Ruth Allgood of Marietta, May 7.

Deaths

Philip Heinrich Kreuscher * Chicago, Northwestern University Medical School, Chicago, 1909, since 1912 assistant professor of surgery and formerly instructor in orthopedic surgery and clinical assistant in surgery at his alma mater, clinical professor of orthopedic surgery at Loyola University School of Medicine from 1919 to 1932, member of the Clinical Orthopedic Society, Chicago Surgical Society, Chicago Pathological Society, Institute of Fracture Surgery, American Association for the Surgery of Fractures and the Chicago Orthopedic Club, president of the Illinois State Medical Society in 1933 and past president of the Jackson Park Branch of the Chicago Medical Society, in 1934 president of the Northwest Regional Conference, fellow, vice president 1930-1931 and formerly a governor of the American College of Surgeons, medical director of the Industrial Commission of Illinois from 1932 to 1936, retired in February 1943 as chief surgeon of the Chicago District Carnegie-Illinois Steel Corporation, a position he had held since 1937, in the latter year had been named by the governor as a member to a newly created advisory board of the division for handicapped children, state department of public welfare and in 1942 was appointed chairman of the first special advisory committee to the division of industrial hygiene of the Illinois Department of Public Health, served as attending orthopedic surgeon to the Mercy, Misericordia and Cook County hospitals, attending major surgeon to the Passavant Memorial Hospital and the Wesley Memorial Hospital where he died June 1, of acute cardiac failure, aged 59.

Guy Leartus Connor * Detroit, Johns Hopkins University School of Medicine, Baltimore, 1901, formerly assistant clinical professor of neurology, psychiatry and preventive medicine at the Detroit College of Medicine, member of the House of Delegates of the American Medical Association in 1917, 1918 and 1920, formerly a member of the Federation of State Medical Boards and in 1928 president, a member of the Michigan State Board of Registration in Medicine from 1917 to 1929 and secretary from 1924 to 1929, president of the Michigan State Medical Society, 1923-1924 and vice president, 1911-1912, president of the Detroit Academy of Medicine in 1917, fellow of the American College of Physicians, for many years medical director for the board of education of Detroit, served on the staffs of the Children's Hospital of Michigan, St. Mary's Hospital and the Harper Hospital, assistant secretary and managing editor of the *Journal of the Michigan State Medical Society* from 1903 to 1905 and associate editor from 1919 to 1923, aged 68, died April 19 in Fort Lauderdale, Fla., of cerebral hemorrhage.

James Pemberton Hutchinson * Media, Pa., University of Pennsylvania Department of Medicine, Philadelphia, 1893, member of the American Surgical Association and the Society of Clinical Surgery, at one time adjunct professor of surgery at his alma mater, served as a major in the medical corps of the U. S. Army and as chief of the American Hospital at Neuilly, France, during World War I, received the Cross of the Legion of Honor of France from the French government and the Distinguished Service Cross, formerly associate director and director of the Pennsylvania Mutual Life Insurance Company, Philadelphia, at one time on the staffs of the Pennsylvania and Methodist hospitals and St. Timothy's Hospital, now known as the Memorial Hospital, Roxborough, Philadelphia, formerly on the staff and from 1925 to 1941 a member of the board of managers of the Hospital of the Protestant Episcopal Church, Philadelphia, for several years president of the board of directors of the School for the Blind, Overbrook, aged 75, died, April 8, of heart disease.

Frederick Cowles Herrick * Cleveland, Western Reserve University Medical Department, Cleveland, 1897, demonstrator of surgery at his alma mater from 1901 to 1907, instructor in surgery from 1907 to 1910, lecturer on surgery, 1910-1911, associate in surgery from 1911 to 1921, assistant clinical professor from 1921 to 1933 and later associate clinical professor of surgery, specialist certified by the American Board of Urology, Inc., and the American Board of Surgery, fellow of the American College of Surgeons, member and past president of the Ohio section of the American Urological Association, chief surgeon at Camp Grant, Ill., and Base Hospital number 83 of the American Expeditionary Forces during World War I, colonel in the medical reserve corps of the U. S. Army not on active duty, formerly chief of the surgical staff, St. Vincent Charity and Cleveland City hospitals, consultant in urology at St. John's Hospital, member of the city chamber of commerce, aged 70, died, April 5, of hypertensive arteriosclerotic heart disease.

George Burt Lake * Highland Park, Ill., Rush Medical College, Chicago, 1902, Army Medical School, Washington, D. C., 1911, assistant surgeon for the Mexican Central Railway from 1902 to 1904, practiced at Wolcottville, Ind., from 1904 to 1910 and was town health officer, 1907-1908, special lecturer in hygiene and sanitation at Purdue University, La Fayette, Ind., from 1908 to 1910, an officer in the medical corps of the U. S. Army from 1910 to 1924, resigned as a major, served during World War I, colonel in the medical reserve corps of the U. S. Army not on active duty, member of the Association of Military Surgeons of the United States, American Physicians' Art Association, Illinois Academy of Science and the American Association of the History of Medicine, attending internist to the American Hospital, Chicago, from 1927 to 1934, editor and publisher of *Clinical Medicine and Surgery*, author of poetry, aged 62, died, March 2, in the Lake Forest (Ill.) Hospital of paralytic ileus and hemorrhaphy.

William Edgar Caldwell * New York, University and Bellevue Hospital Medical College, New York, 1904, professor of clinical obstetrics and gynecology at the Columbia University College of Physicians and Surgeons, New York, formerly instructor of obstetrics at the New York University Medical College, specialist certified by the American Board of Obstetrics and Gynecology, Inc., member of the American Gynecological Society, fellow of the American College of Surgeons, served as a captain in the medical corps of the U. S. Army during World War I, for many years on the staff of the Bellevue Hospital, associate director of the Sloane Hospital for Women, consultant to the Presbyterian Hospital, New York, and the Monmouth Memorial Hospital, Long Branch, N. J., in 1934 received a gold medal from the American Roentgen Ray Society and in 1941 the honorary degree of doctor of public health from New York University, aged 63, died, April 1, of congestive heart disease.

William Allan * Winston-Salem, N. C., College of Physicians and Surgeons, Baltimore, 1906, professor of medical genetics at the Bowman Gray School of Medicine, served as visiting professor of medicine at the Medical College of Virginia, Richmond, and professor of parasitology at the North Carolina Medical College, Charlotte, past president of the Medical Society of the State of North Carolina and the Mecklenburg County Medical Society, member of the Association of American Physicians, specialist certified by the American Board of Internal Medicine, served during World War I, lieutenant colonel in the medical reserve corps, U. S. Army not on active duty, formerly director of the family record department at the Memorial Hospital in Charlotte, aged 61, died, April 24, in the North Carolina Baptist Hospital of lobar pneumonia.

Albert P. Brubaker, Philadelphia, Jefferson Medical College of Philadelphia, 1874, member of the Medical Society of the State of Pennsylvania, emeritus professor of physiology and medical jurisprudence at his alma mater, professor of physiology at the Pennsylvania College of Dental Surgery from 1885 to 1907, formerly lecturer of physiology and hygiene at the Drexel Institute of Art, Science and Industry, received the honorary master's degree from the Franklin and Marshall College, Lancaster, Pa., in 1888, a member of the College of Physicians of Philadelphia, Academy of Natural Sciences, American Philosophical Society and the American Physiological Society, author of a textbook of "Human Physiology" published in many editions, aged 90, died, April 29, in the Jefferson Hospital.

Arthur Henry Geiger * Chicago, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900, chairman of the Illinois Professional Committee for Medicine, Department of Registration and Education, specialist certified by the American Board of Otolaryngology, member of the American Academy of Ophthalmology and Otolaryngology and the Association of Military Surgeons of the United States, lieutenant colonel in the medical reserve corps of the U. S. Army not on active duty, member of the attending staff of the Henrotin Hospital, president of the staff and attending ear, nose and throat surgeon to the Illinois Masonic Hospital, where he died, May 12, of bronchogenic carcinoma of the right lung, aged 65.

Cornelius Gysbert Dyke * New York, State University of Iowa College of Medicine, Iowa City, 1926, associate professor of radiology at Columbia University College of Physicians and Surgeons, specialist certified by the American Board of Radiology, Inc., member and in 1938 vice president of the American Roentgen Ray Society, member of the American College of Radiology and the Harvey Cushing Society, director of radiology at the Neurological Institute of New York, joint author with Dr. Leo M. Davidoff of "Normal Encephalogram".

1937 and Roentgen Treatment of Diseases of the Nervous System 1942 attending radiologist to the Presbyterian Hospital where he died April 23 of acute leukemia, aged 42

Kerwin Weidman Kinard Φ Swarthmore Pa University of Pennsylvania Department of Medicine Philadelphia 1908, past president of the Jackson County (Mo) Medical Society and the American Association for the Study of Gout, fellow of the American College of Surgeons served as an officer in the medical corps of the U S Army and during World War I, colonel in the medical reserve corps of the U S Army not on active duty formerly chief of the division of clinics bureau of tuberculosis control, state department of health served on the staff of the Chester (Pa) Hospital, plant physician for the American Viscose Corporation at Marcus Hook, aged 57 died, April 1, in Philadelphia of coronary occlusion

John James Corbett Φ Detroit, Syracuse University College of Medicine 1917 associate professor of clinical proctology at the Wayne University College of Medicine specialist certified by the American Board of Surgery and a member of the founders group in proctology member and in 1940 elected vice president of the American Proctologic Society fellow of the American College of Surgeons served in the medical corps of the U S Army during World War I attending surgeon in proctology at the Harper Hospital Herman Kiefer Hospital and the Childrens Hospital an associate surgeon at the Receiving Hospital aged 49 died April 10 of carcinoma of the stomach

Herbert I Harris Φ Lieutenant Colonel U S Army, retired Geneva Ill University of Buffalo School of Medicine 1898 a contract surgeon in the U S Army from 1898 to 1908 captain in the medical section of the Officers Reserve Corps in 1917 and later a major lieutenant colonel in the medical corps of the National Army in 1918 honorably discharged Oct 31, 1919 and retired on the same date for disability in line of duty under a special act of Congress in June 1930 was retired with the rank of lieutenant colonel in the medical corps of the U S Army aged 68 died April 24 in the Community Hospital of diabetes mellitus and septicemia due to carbuncle of the neck

Frederick Allport Dale Φ Colonel U S Army retired Baltimore University of Pennsylvania Department of Medicine Philadelphia 1900 commissioned a first lieutenant in the medical corps of the U S Army in 1901 and rose through the various ranks to that of colonel his military career took him to China Japan the Philippine Islands, Siberia and to France during World War I retired Aug 31 1936 at which time he was surgeon of the Third Corps Area now the Third Service Command fellow of the American College of Surgeons aged 70 died April 16 in the U S Marine Hospital Baltimore of cerebral hemorrhage

David Nathaniel Shippee, Wanaque N J Baltimore Medical College 1894 on the courtesy staffs of St Josephs and Paterson General hospitals Paterson served as health officer school physician and a member of the board of education of Pompton township at one time president of the First National Bank of Pompton Lakes for many years surgeon for the Erie Railroad an examining physician for the Passaic County Draft Board number 1 during World War I for many years first assistant chief of the fire department of Wanaque Valley, aged 69, died April 6 of cerebral hemorrhage and diabetes mellitus

Herbert Lynn Halbert Φ Staten Island N Y Columbia University College of Physicians and Surgeons New York 1918 fellow of the American College of Surgeons president of the Richmond County Medical Society attending surgeon and roentgenologist Staten Island Hospital attending surgeon, Richmond Borough Hospital and Seaside Hospital consulting roentgenologist Richmond Memorial Hospital served in the army transport service during World War I aged 52 died, April 6 in the New York Post-Graduate Medical School and Hospital of intestinal obstruction

May Salona Holmes Φ Orleans Mass Woman's Medical College of the New York Infirmary for Women and Children New York 1895 an Affiliate Fellow of the American Medical Association superintendent of the Belmont Hospital Worcester from its inception in 1896 until her retirement in 1941, in 1936 a three story isolation wing of the hospital was named the May Salona Holmes Building in her honor the hospital employees honored her by placing a tablet in the building's library aged 71 died April 4 in the Worcester City Hospital of carcinoma of the breast with metastases

Thomas W Adair, Archie Mo Kansas City Medical College 1885 member of the Missouri State Medical Association twice president of the Cass County Medical Society formerly chief examining physician for the Cass County Selective Service System served as a member of the board of education aged 86 died March 5, of pneumonia

Jacob E Barrows, Parkersburg W Va, Metropolitan Medical College, Chicago, 1900, member of the West Virginia State Medical Association aged 73, died, February 18, of angina pectoris

Samuel McCune Black, Carnegie, Pa Western Pennsylvania Medical College Pittsburgh, 1897, aged 73, died, February 13, of cerebral hemorrhage, hypertension, arteriosclerosis and carcinoma

John A Colgan Φ Philadelphia, University of Pennsylvania Department of Medicine Philadelphia, 1901, formerly on the staffs of the Wills and Howard hospitals, aged 66, died February 16 of acute cardiac dilatation, chronic myocarditis and chronic endocarditis

John Parke Duggan, Pittsburgh, University of Louisville (Ky) Medical Department, 1911 served during World War I aged 55, died, February 5, in the Veterans Administration Facility of cerebral thrombosis and hypertensive cardiovascular disease

Alfred Ellhott Φ Middleboro, Mass College of Physicians and Surgeons Baltimore 1900 aged 71 served on the staff of St Luke's Hospital where he died March 1, of heart disease

Otoniel Trejos Flores, Dodge Center, Minn, Loyola University School of Medicine Chicago, 1919 mayor of Dodge Center from 1930 to 1932 Dodge County physician from 1926 to 1933 on the staff of the Owatonna (Minn) City Hospital aged 56 died March 5, in St Mary's Hospital, Rochester of diabetes mellitus and chronic nephritis

William H Gibson, Des Moines Iowa, Bennett College of Eclectic Medicine and Surgery, Chicago, 1903, aged 74, died March 4 of cerebral thrombosis

James A Henrichsen, Larsen, Wis, National Homeopathic Medical College Chicago 1894 member of the State Medical Society of Wisconsin aged 75, died, March 4 of carcinoma

Willis Wharton Jones, Washington, D C, Howard University College of Medicine, Washington 1904, aged 64, died, March 18 of hypertension and arteriosclerosis

William A Kinnan, Washington, D C Columbian University Medical Department Washington, 1895, aged 79, died, March 31, of carcinoma of the prostate

Francis Gustave Lagerstrom, Minneapolis, Kansas Medical College Topeka, 1899 aged 67 died March 13, of carcinoma of the tongue with metastasis and bronchopneumonia

N Sanford Messenger, Elmira, N Y University of Buffalo School of Medicine 1881, died, March 4, of coronary occlusion and arteriosclerosis

Avedis Nakashian, Forest Hills N Y American University of Beirut School of Medicine, Syria 1894, aged 75, died, March 29, of cerebral hemorrhage and heart disease

Lurton F Polk, Lincoln Neb, Physio-Medical College of Indiana Indianapolis, 1880, aged 84 died, March 22

George Rock, Auburn Ind Toledo (Ohio) Medical College 1891, aged 89 died March 31 in the Lutheran Hospital, Fort Wayne of carcinoma of the stomach

Emery Martin P Seeburt, San Francisco College of Physicians and Surgeons of San Francisco, 1918 aged 54, died March 27, of coronary occlusion

Frank Aloysius Tyler Φ Seattle University of Minnesota College of Medicine and Surgery, Minneapolis 1906 formerly a druggist aged 60 died, March 3 in the Virginia Mason Hospital Seattle of cerebral thrombosis and arteriosclerosis

Charles Grover Walters, Pittsburgh University of Pittsburgh School of Medicine, 1910 aged 55, died, March 28 in the Mercy Hospital

DIED WHILE IN MILITARY SERVICE

Morris S Birnbaum, New York Medizinische Fakultät der Universität, Wien Austria 1937 member of the Medical Society of the State of New York first lieutenant in the medical reserve corps of the U S Army aged 30 died Aug 18 1942 at the Island of Oahu Territory of Hawaii of brain tumor

Sam Futrovsky Washington D C George Washington University School of Medicine Washington 1940 served as a resident on the staff of the National Homeopathic Hospital first lieutenant in the medical corps of the Army of the United States a flight surgeon attached to Elgin Field Fla where he died Oct 6 1942 of injuries received in an airplane accident, aged 29

Correspondence

THE MEDICAL PROFESSION AND PLANNED HEALTH

To the Editor—Is the health of the people the concern of the people? The answer to this question is a challenge to the American medical profession. The war is accelerating the trend toward greater and more comprehensive social planning by governments throughout the world, and in every instance special consideration is being given to problems of national health. Our own government has stated clearly that the health of the people is the concern of the government. The Beveridge plan in England, the social security laws in New Zealand, the proposed Australian plans and the social security legislation already submitted to the Congress may be prophetic evidence that a program of planned health in our own country is ultimately inevitable. The medical profession, therefore, may soon be faced with a crisis in its affairs.

In general our profession has always regarded the health of the people as its own concern, and any attempt at governmental interference has been looked on with suspicion. This attitude is not peculiar to the medical profession but is common to many groups possessing specialized knowledge. Thus the banker may assume that he alone should regulate matters of finance, and the lawyer the field of law. As long as the course of human events runs smoothly, these assumptions are not questioned by the people. However, in periods of great social unrest, when adverse circumstances cast doubts on the validity of such assumptions, a significant change may occur. The people, having lost confidence in leaders of specialized groups, then undertake tasks requiring technical knowledge which they do not possess. In the absence of informed leadership, theories and plans are developed which must be discarded later because of their unsoundness and unsuitability. The mutual grievances of the moment then preclude the integration of the special knowledge of the one group with the needs of the other. At such times only by the closest cooperation and mutually unselfish devotion to a common objective can public confidence be maintained and progress assured.

It would be useless to deny that we are now going through a period of great social change and that the concept of a system of planned health, by the state, for all the people is rapidly emerging as an important part of every social security program. It may be interesting to point out that its origin is outside the medical profession. Organized medicine, however, cannot ignore for long this widespread popular demand, which affects so vitally its traditional tenets.

The attitude which the medical profession takes toward governmental planned health can be the one decisive factor which determines whether the plan shall be conducted on a high intellectual and scientific plane or on the level of purely economic and political expediency. The history of this movement in other countries has been too frequently associated with antagonism and bitterness, resulting in compromises which have proved to be unsatisfactory both to the state and to the medical profession. This predicament could be avoided if the state and the profession agreed to recognize their respective limitations. The larger aspects of a social security program and the scope of planned health should concern primarily the state, and here the role of the physician is that of a citizen rather than a doctor. The medical, or professional, phase of the program is the concern chiefly of the medical profession, since it alone possesses the technical knowledge on which far reaching decisions and plans for better health must be based.

It is increasingly obvious that it would be futile for the medical profession to favor the status quo, since in a society

changing as rapidly as ours the status quo is merely an illusion. We must go either forward or backward, and the status quo is relative regression, since society is surging onward. Furthermore, no group or profession, however well intentioned, can withstand a rampant public opinion once the people have become convinced that they have a just cause.

What, then, is the task which confronts the medical profession in this critical period of its long and honorable history?

First of all the profession should agree to join with the state in the common enterprise of formulating a plan which would provide the highest possible degree of health for all the people. At the outset the state and the profession should have a clear understanding of the common purpose and the common goal. The best minds and talent of the profession and the state must be enlisted to survey, jointly and objectively, the vast existing mechanisms of medical and all allied services. This study should embrace the scientific, the educational, the administrative, the economic and the sociological aspects of the entire field. In addition, a study should be undertaken along similar lines of planned health programs soon to be introduced or already functioning in other countries.

It would be a work of monumental proportions, but from the knowledge thus gained a foundation could be laid on which to build a system of planned health which approached the ideal and for which the state and the medical profession assumed joint responsibility. Since the public, in the final analysis, is both judge and jury, the result of this cooperative study and the plan arising from it should receive the widest possible publicity to the end that an informed people might render a fair and competent judgment.

Here is the task and the opportunity for service worthy of a great profession. May the effort be not too little or too late!

ASHLEY W. OUGHTERSON, M.D., New Haven, Conn.
EDWARD J. OTTENHEIMER, M.D., Windham, Conn.

"HUEPER'S OCCUPATIONAL TUMORS"

To the Editor—In the Book Notices in *THE JOURNAL*, January 23, was a review of Hueper's "Occupational Tumors and Allied Diseases." A paragraph states what the character of the subject matter is. And then follow four paragraphs of adverse criticism of some small phases of these important industrial problems.

I believe that this is an unfair review of a stimulating and exceedingly interesting presentation of the problem of occupational cancer. The reviewer may not agree with the author's theories concerning the origin of these malignant growths but he must have had his curiosity aroused regarding the origin of so many different forms of cancer which can be directly related to industrial chemical hazards. The historical presentation of chimney sweeps' cancer from the time of Percival Pott down to the present forms a fascinating chapter which is well worth the attention of any student of cancer. The author has collected an amazing number of references to every form of cancer which may have an occupational relationship. In some portions of this review he speaks authoritatively, as in the dye cancers of the genitourinary apparatus. The chapters on the radioactive chemicals are well done and beyond controversy. It is unnecessary to take up the subject matter chapter by chapter. There is a wealth of material in this book and much of it is new to the average medical reader. The attempt to include some of the more doubtful types of malignant tumors under the hazards of industry may be put down to enthusiasm. Inaccuracies, as noted in *THE JOURNAL* review, are bound to occur in such an extensive subject. These will no doubt be corrected in later editions.

To my mind this book is a "must" volume to every physician connected with industry. The clinical workers in the tumor clinics of the country will find much to arouse their interest from reading this book. The research workers also can use it as a reference book to great advantage.

JOHN J. MORTON, M.D., Rochester, N. Y.
Professor of Surgery, University of Rochester
School of Medicine and Dentistry

TREATMENT OF DELAYED MENSTRUATION

To the Editor—An article recently published displays a deliberate obscurity in reference to previous work and thus gives a false impression of originality to the casual reader. I refer to a Combined Method for the Treatment of Delayed Menstruation and a Test for Early Pregnancy, by Haig Carapetyan (THE JOURNAL, May 8, p. 81).

The author treats the subject as if it were a new idea arrived at by acute deduction from vague hints in the previous literature. Actually the original clinical article on this subject was published by myself and co-workers in THE JOURNAL two years ago. In this article we related the subject matter to our previous work in animals and reported our results in 48 clinical cases. Since that time there have been at least four confirming clinical reports in the American literature, namely:

- Settel Edward Simultaneous Use of Prostagmine Methylsulfate as Treatment for Delayed Menstruation and as a Diagnostic Test for Pregnancy *M Rec* 155 331 (Jan.) 1942
- Grossman L. L. Treatment of Delayed Menstruation with Prostagmine *West J Surg* 50 103 (Feb.) 1942
- Parrella Dominick Prostagmine in Delayed Menstruation *North est Med* 41 384 (Nov.) 1942
- Sneider M. J. The Prostagmine Pregnancy Test and Treatment for Delayed Menstruation *Illinois M J* 83 107 (Feb.) 1943

There have also been some confirming articles in the South American literature. At least 200 clinical cases in all are now on record. To these Dr. Carapetyan has merely added 57 additional cases which are only confirmatory in nature and which do not add any original observations or ideas.

True Dr. Carapetyan mentions my previous articles in his paper. But this is only with reference to certain control animal experiments and is done in such a way as to make his own clinical data appear to be completely original. He makes no mention whatever of the confirming literature indicated. Nowhere either in the body of his paper or in his conclusions, does he say or even suggest that his data are confirmatory in nature.

Director, Metabolic and Endocrine Research,
Michael Reese Hospital.

'PENTOSURIA AND DIABETES MELLITUS'

To the Editor—It should have been as apparent to us as it was to several friendly critics that the evidence presented in our report (THE JOURNAL, Sept. 5, 1942, p. 25) did not warrant the statement in the summary that we were dealing with a case of chronic essential pentosuria. Using the same tests as were used at the time of the original study (as well as additional tests) seven collections of the same patient's urine at intervals between September 1942 and January 1943 were found to contain no pentose. This further evidence, in our opinion, makes it clear that the reported pentosuria was transitory, certainly not 'chronic,' and doubtfully worthy of the designation 'essential.'

Pyogenic Osteomyelitis of Thoracic Spine—In the developing clinical picture of pyogenic osteomyelitis of the spine, Solomon and Pichman point out, the local or distant paravertebral complications may commonly appear as the primary condition, while extensive destruction of the spine may progress and remain unrecognized. In any instance with high fever, pain in the back over the spine and x-ray evidence of mediastinal widening (mediastinitis) should have the possibility of pyogenic dorsal vertebral osteomyelitis excluded regardless of other pulmonary signs, symptoms or x-ray appearances and despite the failure to demonstrate x-ray changes in the vertebrae. The clinical, pathologic and x-ray features of this condition are discussed and an illustrative case with changes at necropsy is reported.

Roentgen Treatment of Chronic Asthma—Observations on the roentgen treatment of their first 100 consecutive patients with chronic asthma over six months unexpectedly focused the attention of Hull, Balyat and Chont on the importance of infection in the asthmatic problem. Because of the superior results in such patients from roentgen therapy the selection of the 1,529 patients treated since has been made easier. Although a number of investigators have used roentgen therapy in the treatment of asthma, none have considered fully the importance of infected accessory nasal sinuses as an etiologic and aggravating factor in severe cases. Most of the patients who received roentgen therapy to the chest also received radiation therapy to the accessory sinuses whenever they were involved. At this time the authors are able to offer the following conclusions on this method of treating severe asthma complicated by infection:

- 1 Asthma can be controlled in many individuals who did not respond satisfactorily to methods used previously.
- 2 Radiation therapy in asthma is of definite value to patients with infection in the bronchial tubes and/or the paranasal accessory sinuses.
- 3 Infection has proved to be of greater importance in the asthmatic problem than previously regarded because of the pronounced response of these individuals to radiation therapy.
- 4 Radiation therapy of patients with asthma free of infection seems to have little or no effect.
- 5 The technique of choice is the "cross fire" method in which the dosage is concentrated over the greatest areas of the lungs where most of the bronchial tubes are distributed.
- 6 The method is not without danger but is safe when accurate, detailed records are kept on each individual and when the dose of radiation is maintained within a safe range. Irradiation of larger areas of the chest appears to have given better results.

Intraperitoneal Protection Test for Yellow Fever—Whitman found that mice between 18 and 21 days of age are intermediate between newborn and adult mice in their susceptibility to the intraperitoneal injection of yellow fever virus. Uniform death may be produced by injecting one tenth of the virus dosage required for adult mice without the need for the additional intracerebral injection of starch. Three times as much virus is required to kill 21 day old mice as it does to kill 18 day old mice.

Recent Extension of Typhus in the United States—Topping and Dyer present histories of several cases of endemic typhus that occurred in cities not considered within the endemic area in the United States. They recommend that physicians throughout the Midwest and other sections of the country keep endemic typhus fever in mind as a possible diagnosis in cases of fever of undetermined origin, particularly those with an unexplained exanthem.

- Electrical Skin Resistance Technique Used to Map Areas of Skin Affected by Sympathectomy and by Other Surgical or Functional Factors F G Whelan and C P Richter, Baltimore—p 454

Experimental Studies on Headache—Kunkle and his associates regularly induced headache in normal erect human subjects by the free drainage of approximately 20 cc of cerebrospinal fluid. Such drainage headache was reduced in intensity by the intrathecal injection of isotonic solution of sodium chloride and the restoration of the cerebrospinal fluid volume, by tilting the body toward the horizontal or simply by flexion or extension of the head. In its response to postural changes, drainage headache was independent of the estimated intracranial pressure. Drainage headache was usually augmented in intensity during distention of intracranial veins secondary to bilateral jugular compression. In a subject who previously had had

unilateral section of the roots of the fifth and ninth cranial and the upper four cervical nerves induced drainage headache was absent over the homolateral frontotemporal area. This indicates that the afferent impulses from the frontal portion of the area of drainage headache traverse the fifth cranial nerve. Thus it is inferred that drainage headache is caused primarily by traction by the brain on various structures sensitive to pain which anchor it to the cranium, dilatation of some of these structures, the intracranial veins and increase in brain volume are suggested as joint factors in the augmented traction which follows drainage of fluid and leads to headache. The headache that often follows lumbar puncture has predictable and unique features all of which indicate its similarity to drainage headache. The usual variety of postpuncture headache is similar in type and mechanism to the headache induced by drainage of cerebrospinal fluid, i. e. it is caused by dilatation of and traction on intracranial vascular structures sensitive to pain. It is probably secondary to a prolonged leakage of fluid through the dural hole in the lumbar sac produced by the operator's needle. The headache often associated with increased intracranial pressure has been assumed, but never proved to be related to the increased pressure. Present studies indicate that in the production of headache, increased intracranial pressure is neither a prime nor an essential factor. From the data it is concluded that the headache associated with decreased or increased intracranial pressure results from traction on or displacement of intracranial structures sensitive to pain and is by itself independent of generalized intracranial pressure changes.

Sequelae of Equine Encephalomyelitis—Noran and Baker studied the pathologic changes in the nervous system of a child who died three years and five months after contracting equine encephalomyelitis at the age of 5 months. During the years following recovery from the acute illness convulsive seizures, spasticity of all limbs atrophy of the optic nerves mental retardation and progressive cerebral atrophy developed. The observations represent the first report on the chronic end results of infection with the western strain of equine encephalitis. The neurologic lesions consisted chiefly of a destructive process which had produced multiple glia-lined cavities within the frontal lobes and widespread degeneration of the parenchymal elements throughout the brain. Many of the vessels were occluded by an endothelial increase or by deposition of calcium within their lumens. The extensive vascular damage, with occlusion of the lumens and ischemia appears to be the primary cause of the tissue damage in this disease and suggests a vascular spread of the virus.

Cholesteatomas of Central Nervous System—Eleven of the 23 epidermoids and dermoids (cholesteatomas) of the central nervous system that Rand and Reeves discuss are instances of diploic or cranial epidermoids. The cases represent tumors of the type observed in persons admitted to the neurosurgical service or discovered on postmortem examination at the Los

Angeles County General Hospital and cases of such neoplasms studied in private practice. As far as the authors know fewer than 200 epidermoids of the central nervous system have been reported. The intracranial variety is seldom diagnosed preoperatively. The extradural or diploic type can be recognized roentgenographically. The diploic type is easily accessible surgically and the operative results are exceptionally good. Sebaceous cysts of the scalp can be distinguished pathologically from epidermoid tumors by the absence of squamous epithelium and of keratohyaline granules and the presence instead, of a secreting type of epithelium in the former. The fact that such epidermoids are sometimes overlooked may be given as the reason that Mahoney was able to find only 23 diploic epidermoids among the 142 that he found reported in the literature in 1936. Although complete extirpation of these tumors is necessary to prevent recurrence, this often is not feasible with intracranial epidermoids because of their extent and attachment to vital structures. The signs and symptoms of epidermoids of the cerebellopontine angle are similar to those of acoustic neuromas with the exception that cranial nerves on the affected side appear to be more definitely involved. "Epidermoid" and "dermoid" seem the most satisfactory terminology for these tumors. The use of the term "cholesteatoma" is unfortunate because it refers to a chemical by-product which is neither an essential nor an invariable constituent of these tumors.

So-Called Benign Metastasizing Gout—Friedman's first illustrative case of benign metastasizing gout neatly falls into this category. Yet in spite of the benign microscopic appearance of both the primary lesion and the secondary lesions the condition is regarded malignant. Secondary deposits in the skull indicate that invasion through the blood vessels had taken place at some time during the presence of the primary neoplasm of the thyroid. This is evidence of a malignant state. The microscopic structure is of little importance in the determination of a malignant condition of thyroid tissue. It is possible that serial sections of the thyroid might have uncovered a miniature carcinomatous area. Such an examination was not feasible in this case because of technical difficulties. Friedman's second case illustrates that metastasis from thyroid carcinoma may bear little or no resemblance to the primary lesion and that unless the primary tumor is also studied the true nature of the condition remains unrecognized. Because of the clinically benign appearance of the thyroid and the benign microscopic character of the cranial tumor this case would undoubtedly have been recorded in the older literature as metastasizing thyroid adenoma. The tumor's pulsatile nature and the audible bruit are in keeping with the well recognized clinical features of these lesions. Intracranial neoplasms in patients with goiters should be considered metastatic until proved otherwise even though the lesion of the thyroid appears insignificant. Treatment consists in radical surgical removal of both lesions followed by roentgen therapy.

"Demerol" as Substitute for Morphine—Batterman and Mulholland used Demerol as a substitute for morphine to control the postoperative pain and restlessness of 488 postoperative patients, 165 of whom had had abdominal section. Demerol also known as dolantin, is the ethyl ester of 1-methyl-4-phenylpiperidine-4-carboxylic acid. The majority had received the drug as a preanesthetic. Among the 164 postoperative patients who received it parenterally after laparotomy, 95.5 per cent of the 182 trials resulted in complete, satisfactory relief of pain discomfort and restlessness. After procedures other than laparotomy, Demerol was only slightly less effective. Thus in 91.5 per cent of 271 trials in 252 cases postoperative pain was completely controlled. An additional 5.2 per cent experienced relief for approximately three hours. In only 4 out of 45 trials after rectal operations did the Demerol fail to give a satisfactory response even in these 4 subsequent administration of a larger dose alleviated pain. Regardless of the severity of the condition the duration of the operation the age of the patient and the ultimate prognosis with rare exceptions 75 to 100 mg of Demerol parenterally every three to four hours, if necessary, made the patient comfortable and facilitated the usual therapeutic procedures. Orally Demerol was effective when pain was not severe or after acute postoperative symptoms had subsided. It is possible to continue to use and to rely on the

oril preparation if postoperative discomfort persists for several days. Postoperatively Demerol rarely caused untoward reactions. The incidence of vomiting was no more than expected after major operations. Since Demerol has been used in the surgical service respiratory depression has not occurred postoperatively. This is a distinct advantage over the opiates. The incidence of catheterization within twenty-four to forty eight hours during ten months among 160 consecutive postoperative patients receiving morphine was 12.5 per cent as compared to 7.8 per cent among 178 consecutive patients operated on during eleven months. The majority of the patients who were catheterized, whether they received morphine or Demerol, had had a rectal operation, a herniorrhaphy or an operation on the lower part of the abdomen. Although the number of such postoperative patients is small and the difference in the incidence of urinary retention between patients given morphine and those given Demerol may not be statistically significant, it is the authors' belief that Demerol is less likely to produce this undesirable complication. In many patients 'gas' pains were effectively relieved. The antispasmodic action of Demerol and the lack of constipation may be definite advantages of the drug. It has little if any action on the cough reflex and hence does not encourage bronchial secretion. Its atropine like action on mucous secretions and the bronchial dilatation that it produces are advantages. The latter is of particular help to patients with bronchial asthma, for whom morphine is contraindicated. Its only disadvantage is far as its postoperative use is concerned is its short action. There is no particular danger of causing undue depression through frequent or large doses.

Effects of Insulin on Blood Lipids of Man—Kaplan and his associates measured the free and esterified blood cholesterol, total fatty acids and phospholipids in 9 schizophrenic subjects in whom hypoglycemia was maintained for several hours by the administration of up to 460 units of insulin. During insulin shock the blood sugar fell as low as 15 or 17 mg and remained at low levels for nearly two hours. The depth of shock observed in the subjects was variable. The almost complete removal of dextrose from the blood stream failed to change appreciably the concentrations of cholesterol, fatty acids or phospholipids of the blood. The injection of 460 units of insulin had as little effect as 110 units.

Succinylsulfathiazole—During the last six months Crohn subjected 28 patients with nonspecific ulcerative colitis, 8 with ileitis or ileocolitis and 1 with intestinal actinomycosis to therapeutic trial by the administration of succinylsulfathiazole. The dose was 0.25 Gm of the drug per kilogram of body weight for ten days, after a lapse of five days a second series was given. With severe diarrhea some form of opium should be administered concurrently to slow down the intestinal discharge and to permit a natural concentration of the drug. Toxic effects were few, loss of appetite was common, nausea or vomiting was rare and occasionally there was a complaint of headache or malaise and mild prostration. In 5 an apparent and quick symptomatic cure was obtained and 11 more of the ulcerative colitis series showed definite improvement. The drug is a welcome addition, particularly since it exhibits no toxic by-effects and can be pushed in large doses with relative impunity. The best results are seen in acute colitis, therefore, if the disease should be recognized in its early acute stages and treated intensively with succinylsulfathiazole the whole picture of the lingering debilitating discouraging chronic ulcerative colitis might be altered. Three out of 4 patients with colitis can be carried to a stage of remission. Preventing recurrences is as great as if not greater than that of inducing the remission. Perhaps the continuous administration of the drug will meet this problem. The case for ileitis is less promising. Terminal ileitis is associated with delay in the distal loops of the small intestine, and a concentration of the drug at this point may overcome a pathologic process if the disease is really an infection. The patient with actinomycosis and several fistulas to the abdominal wall showed definite improvement. Under succinylsulfathiazole the fistulas showed a tendency to dry up, discharge diminished and the macerated dermal tissues of the abdominal wall were enabled to undergo a definite stage of granulation.

Chronic Superficial Atrophic Gastritis—Barnett believes that the moot point as to what constitutes an early chronic pathologic mucosal change may be partially resolved by its persistence. The presence of adherent mucus, patchy redness, definite erosions and edema, all still present on gastroscopic study after an interval of one month, should satisfy the most skeptical. Mucosal hemorrhages do not all progress into pigmented spots but may become erosions or heal. No clear demarcation between the superficial and the atrophic stages can be made. The superficial stage does occur in younger persons and has a shorter duration than the atrophic phase. Superficial gastritis may progress to true atrophic gastritis. In patients who have had frequent gastroscopic examinations, small patchy areas of atrophy can be observed to increase in size and become possible precursors of gastric carcinoma, gastric polyps and sometimes Addison's anemia. The transition of the superficial phase of gastritis into the atrophic phase, accompanied by increased manifestations of malaise, weakness, fatigue and nervousness, is described. Functional gastrointestinal irritability, as illustrated by mucous colitis, was not found to predispose to or to be etiologically related to superficial or atrophic gastritis.

However, the occurrence of mucosal hemorrhage in 39 per cent of patients with mucous colitis suggested that mucosal gastric hemorrhage, not accompanied by gastritis may have some relation to gastrointestinal irritability

Cardiovascular Response to Mecholyl in Mental Disorders—Altman and his co-workers tried to determine whether or not there is any significant or characteristic difference between the cardiovascular reactions of 49 male and 24 female psychoneurotic psychotic and normal subjects to acetyl beta-methylcholine chloride subcutaneously. As a rule the pulse rate increases from 15 to 60 beats per minute after the injection of the drug, the average increase was around 35 beats. The maximal reading was usually obtained three minutes after injection. This was followed either by a precipitate or by a gradual fall, so that the rate reached the preinjection level about twenty-one minutes after the drug was given. Two characteristics of the pulse and diastolic pressure curves were apparent regardless of whether the subject was normal, psychoneurotic or psychotic. The two curves of any single patient pursued remarkably parallel courses in relation to time, the two exhibited maximal deviation from the preinjection level at the same time and returned to that level in about the same time. However the curves were in general not similar quantitatively—a definite

increase in pulse rate was not necessarily associated with a pronounced fall in diastolic pressure. Also little correlation could be made out between the curves and the diagnosis. There was no significant difference except for a slight tendency for the recovery time to be prolonged as the anxiety to the depressed to the hebephrenic group was passed. The systolic blood pressure of the anxiety psychoneurotic group of patients fell within a range of —41 to —99, that of the manic depressive patients between —107 and —201 and that of the hebephrenic dementia precox patients between —205 and —299. Normal individuals when tested with epinephrine or mecholyl may react like the paranoid patients, and this raises the highly speculative question as to whether a normal subject with a high score may not be predisposed to a mental disorder such as anxiety, and whether one with a low score may not be exhibiting a predisposition for hebephrenic schizophrenia.

Hyperparathyroidism and Albright's Syndrome—In the differential diagnosis of hyperparathyroidism, Gorham states: Albright's syndrome, osteitis fibrosa cystica brown pigmented spots and precocious puberty (particularly in females), is most important. In a total of 51 collected reports of patients, 20 were uselessly subjected to operation and 4 of the 20 were operated on a second time. Albright's syndrome is the most important condition to be differentiated from hyperparathyroidism as records show that confusion arises in 40 per cent or cases. The syndrome occurs in a complete and in an incomplete form. The disease starts in early childhood, and in nearly all victims with the complete type symptoms develop before the age of 10. Patients with the incomplete form may be 30, 40 or older before clinical manifestations appear. The disease is more frequent in females. While the X-ray appearance of the bones may be confusing, it should be emphasized that in Albright's syndrome the lesions are scattered localized and multiple and that considerable portions of the skeleton are unaffected. This patchy distribution is in sharp contrast to the general decalcification of all osseous tissue found in hyperparathyroidism and osteomalacia and is more like Paget's disease and xanthomatosis. Sexual and somatic precocity are present regularly in the afflicted female and if accompanied by cutaneous pigmentation or lesions of the bone they should call Albright's syndrome to mind. Calcium and phosphorus determinations on the blood usually distinguish Albright's syndrome from hyperparathyroidism but occasionally a blood calcium above 11 mg and a blood phosphorus below 3 mg may cause confusion.

Epidemic Nausea and Vomiting—Bradley relates that a widespread outbreak of nausea and vomiting was observed in Denmark in 1935. Similar outbreaks were reported in schools and among the general population in England. Although the disease is of minor significance, clinically and economically it may give rise to considerable administrative uncertainty. Those who are unfamiliar with the clinical and epidemiologic picture may be led to suspect food poisoning or dysentery and be stampeded into ineffectual and wasteful action. It is important that at present "epidemic nausea" should be considered in the differential diagnosis of all outbreaks of gastroenteritis. Observers believed that epidemic nausea and vomiting is an upper respiratory infection with an incubation period of from two to seven days and is probably due to a virus. The described outbreak strengthened the impression that the disease is communicable and that the point of entry is the upper respiratory passages. The incubation period was probably within the range of from two to seven days but could not be determined accurately. Infection ex alimentatione immediately preceding the attack was excluded.

Sulfathiazole for Impetigo Contagiosa—Peterkin and Jones state that the effect of local sulfanilamide and sulfapyridine therapy in impetigo was sometimes striking but often disappointing. Sulfathiazole proved to be the drug of choice. Sulfathiazole in a water miscible cream or a starch and zinc oxide paste was used in 120 cases, of 27 not cured by sulfathiazole, 17 were treated with 25 per cent cream. The 93 cures were obtained in an average of 68 days, which compares favorably with the average stay of impetigo cases in the hospital (146 days). The vehicle used seemed to make little difference in the healing rate of the skin cases treated with the 5 per cent paste healed in 65 days and those with the 5 per cent cream in 611 days. Results obtained with 5 per cent concen-

tration were better than those with 25 per cent and compared favorably with results from 10 per cent. Sulfadiazine and sulfamethazine were used in a number of cases, but the results were disappointing. Sodium sulfathiazole (5 per cent cream) gave somewhat erratic results but was definitely better than sulfadiazine and sulfamethazine. Quick healing was also obtained with sulfathiazole in ecchyma and early infective dermatitis, but results were disappointing in infectious eczematoid dermatitis, acne vulgaris and sycosis.

Aminoacridine Compounds as Surface Antiseptics—Browning points out that limitations in the performance of the sulfonamides suggested a return to the aminoacridine compounds which were introduced as surface antiseptics in 1917. These substances are powerfully bacteriostatic toward the important pyogenic organisms and serum does not diminish their action, although blood somewhat reduces it and pus greatly. Their toxicity for the body as a whole is not high, they are comparatively un irritating, and they interfere little with phagocytosis. They are highly effective in preventing the development of infection with various organisms, including streptococci and certain gas gangrene anaerobes when applied to tissues at the site of inoculation. They can control established suppuration in wounds when drugs of the sulfonamide group have failed. Retardation of granulation and healing tends to follow continued use of these compounds, so that it may be advantageous to resort to other treatment later. The important point is their capacity to prevent or control infection.

N-Methylamphetamine, a New Blood Pressure Raising Drug—Dodd and Prescott studied the effects of N-methylamphetamine, a sympathomimetic drug known also as Methedrine or Pervitin. Blood pressure and pulse rates were recorded every three to five minutes in one hundred and thirty operations. In 54 cases the systolic pressure or the pulse pressure dropped sufficiently for the patient to need a pressor agent. N-methylamphetamine was used solely in these cases and was administered when the systolic pressure fell to and remained at 80 mm or less or when the pulse pressure was 10 mm or less, twenty minutes was allowed first for natural recovery. The capacity of N-methylamphetamine to meet the needs of these patients has been studied under average general hospital operating conditions. Anesthetics included all those in common use. N-methylamphetamine has been found to be an effective blood pressure raising drug with a prolonged action. The effective dose is from 15 to 30 mg intramuscularly, or 10 to 20 mg intravenously plus a depot dose of 10 to 20 Gm intramuscularly. In 97 per cent of the cases the systolic pressure was restored to normal levels in from two to eighteen minutes. The systolic pressure was raised from an average of 66 mm to an average maximum of 135 mm and settled to an average minimum of 124 mm. There is no abnormally high rise if the dose is carefully calculated. One injection was adequate for 81 per cent of patients, repeated injections were given to 17 per cent, 1 patient (2 per cent) did not respond. The blood pressure was maintained throughout operation and for several hours after.

Bronchial and Pulmonary Cancer—Wegelin directs attention to the great increase in pulmonary cancer and to the question of whether this increase is real or apparent. Various factors may be responsible for the apparent increase such as improvement in histologic diagnosis and the change in the necropsy material. The change in age levels in the necropsy material deserves consideration. Statistical studies made at the author's request suggest that the higher age levels are a contributing cause in the increased frequency. Pulmonary cancer is from three and a half to four and a half times more frequent in men than in women according to several statistics. The macroscopic picture is not uniform. Wegelin accepts W. Fisher's classification into (1) a nodular and massive form (2) a diffuse infiltrating form (pneumonia-like) and (3) a medullary form. Pulmonary cancer is slightly more frequent on the right than on the left side. Secondary changes occur in the form of necrosis and autolytic decomposition. Metastases are frequent in the author's material of 117 cases; metastases were not found in only 13. The etiology of pulmonary cancer rests on a rather insecure basis. The necessary statistical proofs for the role of chronic irritants in the pathogenesis of pulmonary cancer are still largely absent. W and C Macklin are inclined to ascribe a more important role to the hereditary than to the external factors. The author is inclined to believe that heredity as well as external irritants play a part.

Clinical Aspects of Bronchial and Pulmonary Cancer—Stachlin reports observations on 115 cases observed since 1924. The cases were verified by necropsy and 1 by a microscopic examination of lung puncture. All except 3 proved to be primary bronchial carcinomas, 2 were primary tracheal carcinomas and 1 alveolar carcinoma. No one symptom was present in all cases. Cough, the most frequent symptom, was absent in 19. Expectoration the next most frequent symptom was absent in 30 per cent. Bloody sputum repeatedly suggestive of bronchial carcinoma was detected in only 8 cases. The raspberry jelly sputum regarded as especially characteristic was present in only 3 apparently less often than in other pulmonary diseases. All sputums were searched for tumor cells but were detected in only 1. Dyspnea was present in 75, cyanosis in 40 and the supposedly frequent chest and back pains in 45. Auscultation and percussion failed to reveal abnormalities in 42 per cent. Many symptoms result from complications or from local metastases. Exudative pleurisy often masks the primary tumor; this was observed in 29 cases. Hoarseness existed in 21, recurrent nerve paralysis in 10, audible stridor in 7, dysphagia in 5 and foreign body sensation in 2. These symptoms were caused by the enlargement of intrathoracic lymph nodes. Enlarged extrathoracic lymph nodes were noted in 19 cases (sixteen times in the neck). General symptoms included clubbed fingers, labile or sublabile temperature, weakness and emaciation. Only 78 of the patients exhibited cachexia. The peripheral tumors are not all alveolar tumors but may originate from the epithelium of the small bronchial ramifications. The majority of carcinomas begin in the hilus in one of the main bronchi. The further dissemination along the lymph passages of the lung may produce reticulated outlines in the roentgenogram. Bronchial cancers may give rise to pulmonary metastases which produce spherical shadows. Metastases into the regional lymph nodes are much more frequent than the into

the lung tissue. Necropsy discloses them in the majority of the cases. Secondary processes such as pleural exudates, bronchoectasis or atelectasis obscure the roentgenographic appearance even more frequently than do the lymph node metastases. Roentgenography usually reveals a combination of tumor shadows with shadows of secondary processes. Bronchography and particularly bronchocopy improved the diagnostic results. Early diagnosis is rarely possible because even small bronchial carcinomas may give rise to lymph node metastases. The prognosis is bad; only 7 of the patients survived for more than two years.

Bronchial and Pulmonary Cancer—Radiologic Aspects—Schum reviews 70 cases of pulmonary cancer observed at the radiologic institute of Zurich during the decade 1930-1940. The average age of the patients, of whom 71 were men was 59.8 years. Bronchography was done in 21 cases, with positive results in 10. Bronchoscopy combined with biopsy was performed in 33 cases and gave positive results in one half. Early diagnosis is rare. The clinical picture is dominated by metastases of the regional lymph nodes, the diagnosis is usually made with the cancer in an advanced state. Irradiation produced early palliative results. Noticeable objective and subjective improvement and shrinkage of the tumor in the roentgenogram was observed in 42 per cent of the irradiated patients. The best early results were obtained with protracted fractionated roentgen irradiation. Intrabronchial radium implantation proved ineffective. Pulmonary cancers should be subjected to irradiation because in a certain percentage of the cases life can be made more bearable. In about one fifth of the cases the improvement is considerable but unfortunately not of long duration. Surgery might effect cure in the early stage, but timely recognition is rare. The author has gained the impression that of all cancers the pulmonary ones are least amenable to treatment.

Cancers Produced by Metals—Schutz reports studies on the possible carcinogenic action of metals. The aim was to throw light on the pulmonary cancers of the Schneeberg region, a mining district in which cobalt, nickel, bismuth, arsenic, iron and uranium ores are mined. Because of comparatively high radium emanation in the Schneeberg mines, it was assumed that the Schneeberg cancers, like those of Joachimsthal were radioactive cancers or, more correctly, electronic cancers. However, since pulmonary cancers were observed among men working with chromates, doubts were raised as to the radioactive origin of the Schneeberg cancer. Metal deposits of chromium, arsenic and cobalt were made in the thighs of rabbits. After three years of observation none of the 21 animals exhibited tumors. Of 12 animals observed for a longer period 4 are alive, 1 died of cachexia without cancer and 7 died of malignant growth. Four of the cancers were in the lungs, 2 at the site of implantation and 1 in the hollow of the scutum. The author thinks that the carcinogenic action of metals has been demonstrated, for in view of the rarity of spontaneous cancer in rabbits he doubts that such a high percentage could have had spontaneous cancer.

Action of Estrone in Insulin Resistant Diabetes.—Rocca and Pollack point out that the carbohydrate metabolism is regulated by multiple neurohormonal factors. Besides true pancreatic and renal diabetes there are forms in which the muscular apparatus of the pancreas does not play the decisive role and in which hyperactivity of the hypophysis, the thyroid or the adrenals is responsible. Symptoms of these types of diabetes disappear if the cause is suppressed by irradiation of the hypophysis by a thyroidectomy or by removal of the adrenal tumor. Extrapancreatic factors may also inhibit the action of insulin. The authors resorted to a steroid therapy for diabetic

patients of both sexes, particularly those of the climacteric age and those with insulin resistance, because this hormone is an antagonist of the hypophysis, particularly in its regulatory effect during the menopause. Their observations on a group of patients suggests that estrone has a beneficial effect on the subjective symptoms, the general condition, the carbohydrate tolerance and the insulin requirement. In 1 case a daily dose of 270 units of insulin did not counteract the ketosis and glycosuria and did not reduce the diuresis but the condition improved when estradiol benzoate was given in large doses.

Experimental Dental Lesions of Glandular Origin—Lachella Costa and his collaborators subjected young dogs to thyroparathyroidectomies in order to ascertain whether dental disorders would result. In some of the animals the loss of parathyroids did not cause early or late teeth, probably because of the existence of thyroid parathyroids. The teeth in these dogs were smaller, the implantation was defective and the eruption retarded. In the dogs in which thyroparathyroidectomy resulted in postoperative tetany the dental lesions were more pronounced: they involved the calcification, leading to the destruction of the enamel and exposure of the dentin. The lesions are the result of changes in the calcium metabolism which in turn had been caused by the parathyroid deficiency. Compensatory endocrine treatment did not modify the lesions.

*Report of Diseases in Polish Soldiers Treated in Scotland in Summer of 1940 R. Blum — p. 38

Experience of the German Health Service During the Polish Campaign S. Strumenski — p. 52

Diseases of Polish Soldiers in Scotland—During the summer of 1940 in one field hospital of the Polish camp in Scotland, 1,065 patients were examined. The most frequent infectious disease was scabies (196 cases). It recurred only if disinfection was not adequate. Among 80 with venereal disease there were 31 with recent syphilitic infection, 6 with an old infection, 1 with tibia dorsalis and 42 with acute gonococcal infection. Troops should be examined two or three days after week end permits. Seventy cases of malaria of different forms were successfully treated with quinine and neoarsphenamine. All the primary infections took place in military camps in Rumminia, in the Babradak area. Other diseases were tuberculosis, rheumatic diseases, traumatic casualties, acute and chronic diseases of the alimentary tract, acute appendicitis, illnesses of the respiratory system of nontuberculous origin, diseases of the cardiovascular system, nephrolithiasis, cystitis, neurosis (in 29), tonsillitis, otitis media, hepatic and biliary duct diseases, turunculos (in 15), errors of retraction and 1 each of salivary calculus and tooth and mouth disease.

Experience of German Health Service During Polish Campaign—According to Strumenski the German literature from September 1939 to June 1940 is conflicting as to their preparedness for the evacuation and treatment of the wounded and ill brought about by the mechanized war. Their methods of evacuating the wounded were really not organized for perfect functioning. Contagious diseases and surgical war wounds were their most important concern. The first epidemic of *Shigella* dysentery occurred by the end of September 1939, when many German soldiers were afflicted. The mortality rate was approximately 10 per cent. The German epidemiologist Werner states that at the end of September 1939 epidemic typhus struck the German soldiers. Wildegans writes that the first medical problem of the army in Poland was the transportation of the wounded and ill from the combat zone, they were moved frequently from one station to another and it was several days before they reached a permanent hospital. The situation was similar to that existing in the first world war. Wounds from the maiming of various war arms were less numerous among the Polish than among the German soldiers. Later the situation became more favorable to the Germans, such wounds comprised only 50 per cent of a 5,000 bed capacity of a military hospital in Poland. However, there was a greater number of such German wounded during the invasion of Warsaw and

almost all required surgical treatment. True primary open wounds, when arriving at the hospital, were heavily infected, but still they were easier to treat than the primarily closed (sutured) wounds. The author encountered but 9 instances of gas gangrene among 10,000 wounds.

Surgical Technique in Craniocerebral Wounds N. I. Propper Grashchenkov — p. 3

Morphology of Spinal Fluid in Purulent Meningitis D. A. Shamburov — p. 18

Syndromes Associated with Lesions of Premotor and Motor Zones in Gunshot Wounds of Cranium, Pyramidal Syndrome E. V. Shmidt — p. 40

Surgical Technic in Craniocerebral Wounds—Propper Grashchenkov advocates a liberal use of sulfonamides in the treatment of penetrating craniocerebral wounds, which under conditions of present day warfare are almost invariably infected. Beginning at the first aid station, 1 Gm of sulfanilamide or sulfapyridine should be given internally every four hours. After primary excision of the wound with removal of superficial fragments of metal and bone, a mixture of sulfanilamide and sulfamethylthiazole in the form of an emulsion or a powder should be applied. Specialized neurosurgical units should be attached to the field hospitals to insure early treatment and to limit the stages of evacuation. These units should be equipped with x-ray apparatus and should have plentiful supplies of sulfonamide compounds and a sufficiently large nursing staff to provide individual care for the wounded. This type of wounded should maintain a recumbent posture during transportation, and jolting should be avoided as much as possible. Traumatic meningitis is to be actively treated by intraspinal injection of an 0.8 per cent solution of sulfanilamide, peroral administration of sulfapyridine (1 Gm every four hours) and abundant local treatment of the wounded with a mixed powder or emulsion of sulfanilamide and sulfamethylthiazole in a ratio of 1:2. Toxic effects on the blood may be detected early by noting the appearance of granulated neutrophils and beginning leukopenia. The most effective method for prophylaxis of cerebral abscess is the radical removal of bone fragments and infected metal splinters. Prolapse of the brain indicates a developing meningitis, abscess or gas gangrene and calls for causal therapy. Gas gangrene of the brain is a frequent complication and should be treated by surgical intervention and liberal use of sulfonamides. After infection of the wound has been arrested, granulation and epithelialization may be stimulated by application of balsam oil dressings and ultraviolet irradiation. Increased intracranial pressure may be relieved by intravenous administration of a 40 per cent dextrose solution and a 10 per cent solution of sodium chloride. Magnesium sulfate should not be used at the same time as the sulfonamide preparations, since it increases their toxic properties.

Syndromes of Premotor and Motor Zones—Shmidt reports 2 cases of tangential cranial wounds with fracture of the internal plate of the cranial bones in which small fragments of bone injured a narrowly circumscribed area of the brain, producing syndromes of motor and premotor cortical lesions first observed by Fulton in experimental animals. Although the type of wound was essentially the same in the 2 cases the clinical picture was quite different. In the first case there was paralysis of the right leg with decreased tonus, positive Babinski and Oppenheim reflexes, slightly intensified tendon reflexes and foot clonus. These symptoms indicated an involvement of the motor zone (area 4 and the pyramidal tract). The second case presented a syndrome of premotor zone lesion—spastic paralysis with greatly intensified tendon reflexes, clonus, positive Rossolimo and Bekhterev-Mendel reflexes, grasping reflex of the foot and fanlike spreading of the toes in connection with an exaggerated plantar reflex. There were also definite vegetative disturbances. According to Shmidt the Rossolimo reflex is not a genuine pyramidal symptom but occurs in connection with lesions of area 6 and its pathways. Likewise spasticity is a symptom of the same type of lesion, only it is provoked by a more severe injury. A definite demarcation of the motor and premotor syndromes explains the frequent cases of "dissociated pyramidal syndrome" when either one or the other of its characteristic components is absent.

Book Notices

The Principles and Practice of Obstetrics By Joseph B. De Lee, M.D. and J. L. Greenhill, B.S., M.D. Attending, Obstetrician and Gynecologist, Michael Reese Hospital, Chicago. Eighth edition. Cloth. Price \$10. Pp. 1101 with 1074 illustrations. Philadelphia & London: W. B. Saunders Company, 1913.

Since 1913 there have been six editions of the De Lee textbook. Between the seventh and eighth editions Dr. De Lee died. Two years before his death he asked Dr. J. P. Greenhill to prepare the eighth edition.

In making this revision the author has endeavored to maintain the high standard set by Dr. De Lee for this book. Nearly all the additions, deletions and corrections were submitted to Dr. De Lee and received his approval. One of the major changes is a rearrangement of the material in the first third of the book. English terms have been substituted for Latin terms in naming presentation and position. New chapters have been added concerning obstetric and gynecologic endocrinology, the use of vitamin K in obstetrics, erythroblastosis fetalis, vitamins and minerals, roentgenography in obstetrics, the sulfonamide drugs in obstetrics and the Waters extraperitoneal cesarean section.

Among the sections which have been completely rewritten are those dealing with the toxemias of pregnancy, contracted pelvis, puerperal infection, pyelitis, the acute infections, analgesia and anesthesia, the use of solution of posterior pituitary and of ergot and cesarean section. Many old illustrations have been omitted and many new ones have been added. Each of the bibliographies has been revised to bring it up to date. In his preface the author recognizes the assistance and the contributions of a number of physicians who have aided in maintaining the quality of the book. The index which occupies more than thirty pages is one of the most useful features of this most practical volume. The publisher has done a magnificent job in selecting for the work a light weight paper with an excellent finish so that the illustrations are of extraordinary quality.

The textbook is one of the most complete and at the same time one of the most practical works available in its field. The varied emphasis obtained by the use of different sizes of type and by the nature of the presentation makes it an exceedingly useful book to the student, the practitioner or the specialist.

Treatment of Fractures By Guy A. Caldwell, M.D., F.A.C.S., Professor of Orthopedic Surgery, Tulane University of Louisiana School of Medicine, New Orleans. Cloth. Price \$5. Pp. 303 with 92 illustrations. New York & London: Paul B. Hoeber, Inc., 1943.

Dr. Caldwell states in his preface that he is undertaking to present one or two procedures for each of the common types of fracture which have given good results in his own experience. He recognizes as most of us do that far too many and much too complicated techniques and apparatus have been proposed. The average surgeon or general practitioner finds it difficult to make a selection from among them for the cases that fall into his hands. Dr. Caldwell's discussions of the different kinds of fractures and his descriptions of the treatment methods employed are generally clear and practical. The bibliographies show extensive reading and study but go much beyond the material presented.

Recommendations for the early operative treatment of simple fractures might lead, as they have in previous journal articles and textbooks, to operation too early and to procedures beyond the capacity of the average surgeon. Dr. Caldwell does indeed state quite accurately the points involved but fails to emphasize the difficulties and danger of complications which may be encountered unless the doctor's facilities, experience and technique are such as to justify him in operating on fracture patients. After all, Dr. Caldwell's book is not written for the specialist.

In the treatment of compound fractures the control of hemorrhage, treatment of shock and wound medication are all given precedence over the reduction of the fracture and immediate immobilization. These should always be a first item of consideration. Also, the object of debridement is to remove all foreign material and devitalized tissue. This is accomplished by excising the skin margins for a distance of about one eighth

of an inch and enlarging the wound sufficiently. This is open to misunderstanding and misinterpretation so that excision is done instead of the drainage operation which should always be the principal object of the surgical procedure. Adequate drainage may usually be provided without removal of any skin or much other tissue. Nature should have the responsibility of separating the tissue that is going to die from living tissue which can be used in repair in a majority of these cases.

As is to be expected nowadays, the sulfonamide drugs are given a prominent place in the primary treatment of compound fractures. This leaves out of consideration the toxic character of the sulfonamide drugs, the fact that their role in infected wounds is still imperfectly understood and finally the fact that most wounds will recover with soap and water preparation and no chemical therapy whatever if the principles of surgical treatment are observed.

In chapters on fractures of the clavicle and scapula and fractures of the spine, simple efficient treatment is recommended and explained clearly and in satisfactory detail. The hanging cast of John Caldwell for fracture of the shaft of the humerus is described and recommended. This treatment does not conform to the principles of fracture treatment and should be accepted, if at all, with great caution. The hanging effect and exactly the position desired may be obtained by a body and arm cast in which immobilization is assured and complications of certain kinds much more certainly avoided.

One point of importance in the treatment of the fractures of the lower leg and ankle is that manipulative reductions are recommended without traction. In many of these cases adequate traction is a fundamental preliminary requirement. Manipulation without traction should generally be avoided. Pin traction through the heel with molding of the fragments into place in many lower leg and ankle fractures is the only satisfactory way to insure length and even correct relationship of the tibia, fibula and soft parts in the foot and ankle as a whole. It might be mentioned as a minor comment that the word traction does not even appear in the index of Dr. Caldwell's book, which in itself suggests that this item in treatment is given inadequate consideration.

Biología y tratamiento de las heridas Por el Dr. Luis Gubern Saltschachs, cirujano de número del Hospital de Badalona, Badalona. Con un prólogo del Dr. J. Puig Sureda. Cloth. Pp. 486 with 204 illustrations. Barcelona & Buenos Aires: Salvat Editores, S. A., 1941.

The author of this book is a surgeon who has lived through the experiences of the Spanish Civil War. Although no doubt the multiple problems of a practical nature which came out of this war, problems which had to be solved often in the most precarious circumstances, were the direct motivation for his writing, the author has kept his book far above a simple manual in which clinical impressions are empirically recorded.

The first part comprising fourteen chapters is devoted entirely to the scientific principles governing the biology of injury and repair and of wound infection. The views of Carrel, Leriche, Harvey and others are amply considered and the newer knowledge on the processes of infection and resistance are carefully discussed. Every field in physiology, pathology and bacteriology is explored to yield data for a better understanding of the main topic of wound healing and wound infection, but this is done so thoroughly that the first part of the book is in itself a treatise on general pathology of interest to any student of medicine and biology.

The second part devoted to the treatment of wounds comprises another twenty-two chapters and it is in this part that original contributions of direct interest to the war surgeon are to be found. In this part we often come across the names of such surgeons as Carrel, Quenu, Delbet and Böhrer, men who crystallized in their books the teachings from the first world war. We find also such names as Trueta, Gomez-Duran, Eguagaray and Argüelles who preceded the author in writing about war surgery in the Spanish conflict. The practice of operating regardless of advanced shock in patients is upheld. The usefulness of removing large segments of veins to avoid further extension of thrombophlebitis and septicemia is supported by adequate examples. Also the proper type of suture is indicated in each case.

In the treatment of gas gangrene, Gubbern disagrees with Trueta on the application of the latter's method in severe cases and gives his reasons for so doing. The author's favored method seems to be that of Carrel modified by himself in that the wounds are irrigated when uncovered. This method he applies to wounds in which suture after surgical cleansing is contraindicated or in those previously infected. The methods of Trueta and Orr are amply discussed.

The last chapters are devoted to treatment by physical agents—sunlight being the best—antiseptics, maggots and several others. Orthopedics is also resorted to when the acute phase of the process has subsided.

Two very important items, treatment by sulfonamide compounds and therapeutics of shock, are only slightly dealt with. No new teachings on these two points emerged from the Spanish Civil War. There was neither time nor equipment for research, and there were no large amounts of drugs to be tested. These are the points left to be solved by war research going on at present in so many laboratories.

In the same way in which historians of the future writing on the second world war will have to consider the Spanish conflict as a foreword to it, so no doubt will surgeons of the future writing on war wounds have to take into consideration as a starting point what was sadly learned in Spain, the facts of which are crystallized in this book. Therefore the book is a precious document and its translation into English would be highly desirable.

Comparative Vertebrate Anatomy. By Hilde Heurich Hymm. American Museum of Natural History, New York. Second edition. Cloth. Price, \$1.50. Pp. 511 with 116 illustrations. Chicago: University of Chicago Press, 1942.

Comparative anatomy is usually presented as a dry as dust course from which most students carry away an array of polysyllabic words and a vague impression that the vertebrates, including man, have developed from a diagram of a primitive chordate. Hymm's excellent presentation of the subject should do much to counteract this impression. With its functional and dynamic approach presented in scholarly yet readable and stimulating fashion, it presents comparative anatomy as a grand developmental process. Embryologic, microscopic, gross and physiologic data appear in a cleverly interwoven tissue. Many of the problems and unanswered questions are clearly placed for all to see. This volume should be the leading textbook in its field. As in the past, it will serve as an important aid to many future physicians in their attempts to answer many of the "whys" and "how comes" of the human body. It serves as both laboratory manual and textbook. The latter has been considerably enlarged over the previous edition and clearly reflects a long continued, careful perusal and evaluation of much of the enormous descriptive and experimental literature. The illustrations are excellent.

Lupus oritematoso (estudio clínico sobre 156 observaciones). Por el Dr. Félix Eduardo Ambrosetti. Tesis. Universidad nacional de Buenos Aires, Facultad de ciencias médicas. Paper. Pp. 130 with illustrations. Buenos Aires: Imprenta de Alfredo Frascoli, 1942.

The author summarizes his extensive studies in twenty-nine conclusions, some of which follow. The incidence of the disease is 0.78 per cent of the total of dermatoses studied. Its relation to genuine skin tuberculosis is at the rate of 3 to 1. Cases in females are twice as frequent as in males, the highest incidence being between 20 and 30 years. Epithelioma as a complication was observed in only 2 cases. Sixty per cent showed radiologic signs of tuberculosis and 80 per cent responded to the intradermorrhection with tuberculin. Tuberculosis is not the only cause, for the disease is systemic and the result of several factors. Treatment with chaulmoogra oil and bismuth salts gives satisfactory results. Three hundred and eighty-four references and numerous illustrations are appended.

Cytology and Cell Physiology. Edited by Geoffrey Bourne. Cloth. Price, \$6. Pp. 296, with illustrations. New York & London: Oxford University Press, 1942.

The mere existence of this book is worthy of comment, since it was written in Great Britain during the heaviest air raids, some of it actually in air raid shelters. The editor states in his preface that probably some part of every chapter was written

within the sound of falling bombs. That a composite work by nine authors could be brought together and attractively published under such difficulties is another evidence of British energy and tenacity.

Its eight chapters constitute a review by a group of workers, most of them relatively young, of selected aspects of cytology and of certain fields of biochemistry and biophysics which have something to contribute to our knowledge of cell structure and cell physiology. Its aim is to bring together the work in these fields in the hope of joint progress in the future. The authors assume that the reader has a general knowledge of cytology and they cover only the work of the past few years. On the one hand the book touches on morphology, including microscopic technique, the cell organelles such as mitochondria and the Golgi apparatus, the nucleus and the chromosomes, on the other hand it discusses the physical characteristics of cytoplasm, surface phenomena, the new monolayer technique, the study of mineral constituents by micromicronization and microchemistry, and enzyme systems.

These chapters are all carefully and clearly written, and they assemble information which has not been brought together elsewhere, but they leave us all too well aware that cytology can not yet be greatly clarified by considerations drawn from physics and chemistry. Microscopic observation has added very little in the past few years to what it long since taught us about protoplasm, while it is as yet too early to get more than a glimpse of the light which is to come from physical chemistry. Only here and there in this book, as for example in the chapter on the monolayer technique as applied to substances of biologic importance, do we get a tantalizing glimpse of the future science of cytology. This disappointment is partly inherent in the subject matter, but it must be added that the book itself lacks the master's touch that might give unity and direction to the few real gems of recent years.

Its usefulness is therefore limited, for it is not intended to be a textbook for new students of cytology, nor does it go far enough to serve the advanced worker. For the graduate student beginning his research in physiologic cytology, and for the histologist or pathologist who needs to brush up on the recent work, it contains much information and a comprehensive bibliography.

Heart Disease Is Curable. By Peter J. Steiner, M.D. Cloth. Price, \$1.98. Pp. 193. Garden City, New York: Doubleday, Doran and Company, Inc., 1943.

The chief objection to this book is its title. In the opening chapter the author states that by "curable" he means that which may be made much better and not necessarily all better. Yet one cannot escape the conviction that the title is designed to stimulate the interest of the prospective purchaser. The author writes in language which the layman can understand concerning the various types of heart disease and their management. He emphasizes the importance of early symptoms and urges prompt medical attention in order that a proper regimen may be planned for the individual case. He also offers sound advice to the person who has the fear of heart disease rather than the disease itself. On the whole the book should prove helpful to the person who wishes to know something of the nature of heart disease and of the way to live with it.

Laboratory Manual on Fundamental Principles of Bacteriology. By A. J. Sille. B.S. M.S. Ph.D., Associate Professor of Bacteriology, University of California, Los Angeles. Second edition. Cloth. Price, \$1.50. Pp. 184. New York & London: McGraw-Hill Book Company, 1943.

This manual was written especially to accompany the author's textbook "Fundamental Principles of Bacteriology." Material is included to meet the requirements of beginning students in bacteriology and for students in various divisions of agriculture as well as forestry, home economics, pharmacy, dentistry, sanitary engineering, chemistry, physical education, hygiene and public health. The experiments are arranged for a one semester course of six laboratory hours a week. A brief introduction explains the purpose and value of each exercise. At the end of each exercise, questions are given. This manual may be recommended to students in elementary courses in which the author's textbook is used.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

ROCKY MOUNTAIN SPOTTED FEVER AND DISTRIBUTION OF TICKS

To the Editor—I should like to have detailed information concerning available preparations for prophylaxis against tick bite fever. I am not familiar with the species of ticks in this section. I have a patient whose country place is heavily infested with ticks. There are two children in the family and the mother is anxious to have them immunized. Any information you have concerning sprays to be used on the lawn, pets and so on will be appreciated.

M D Arkansas

ANSWER—There are at present two preparations available for immunization against Rocky Mountain spotted fever (tick bite fever). The first of these is the vaccine prepared from infected tick tissues treated with phenol and solution of formaldehyde. This is the so-called Spencer-Parker vaccine that has been prepared by the United States Public Health Service for some fifteen years. It is distributed without charge to physicians in areas where the disease is endemic. It can be obtained by a physician on request addressed to either the Rocky Mountain Laboratory, Hamilton, Mont. or the National Institute of Health, Bethesda, Md.

The second vaccine that is available for the immunization against Rocky Mountain spotted fever is that prepared from the infected yolk sacs of fertile hen's eggs. This vaccine has been in use in certain sections of the United States for the past several years. The yolk sac vaccine is less difficult to prepare and may eventually supplant the tick tissue type material. One of the biologic laboratories has been licensed to manufacture the egg vaccine but because of press of war work it is doubted that the material is commercially available at this time. However, until such time as it is commercially available, this type of vaccine can also be obtained from the Public Health Service either at the laboratories in Hamilton, Mont., or in Bethesda, Md. In certain states where the attack rates warrant such procedure an adequate supply for each year has been sent to the state health department early in the tick season. In areas where the disease is commonly seen therefore vaccine can be obtained, without charge, directly through the state health officer.

Up until recently *Dermacentor andersoni* (the common wood tick of the Rocky Mountains) and *Dermacentor variabilis* (the brown dog tick, eastern wood tick) were the only two ticks implicated in the transmission of spotted fever to human beings. During the past few months Parker and his associates have found another possible vector, *Amblyomma americanum* (lone star tick) commonly found throughout the southern and southwestern part of the United States. The distribution of these three ticks is such that for practical purposes one can assume that there are few if any areas of the United States that are free from an effective vector of the disease.

There has not been described a tick repellent or spray that is very effective. The U. S. Department of Agriculture has recommended derris powder to use on dogs either as a powder or as a dip. The derris powder should have a rotenone content of at least 2 per cent. An effective dip or wash can be made by dissolving an ounce of soap in a gallon of water and adding 2 to 4 ounces of derris powder containing 4 per cent rotenone. The powder should be applied to the dog at intervals of two to three days and the wash or dip at intervals of five to six days. The handling of dogs or other animals infested with ticks is hazardous and should be done with care. Tweezers should be used to remove ticks if possible; otherwise the fingers should be protected with a piece of cloth or paper. The hands should be carefully washed afterward with soap and water and rinsed in alcohol to sterilize following soilage with contents of any possibly infected ticks.

OPERATION FOR CATARACT

To the Editor—What is the percentage of successful operations for cataract?

Israel Herman M.D. Paterson N. J.

ANSWER—The answer depends on the character of the cataract, on the patient and on the operator. The average skilled operator produces useful vision in about 90 to 98 per cent of operations for uncomplicated senile cataract provided there are no other ocular abnormalities.

EFFECT ON FETUS OF QUINIDINE ADMINISTERED IN PREGNANCY FOR PAROXYSMAL TACHYCARDIA

To the Editor—A white woman aged 38, five months pregnant, has had recurrent attacks of auricular fibrillation for the last three or four years. No organic heart disease is demonstrable. The electrocardiographic tracing is normal in all four leads except during the attacks of paroxysmal auricular fibrillation and then the tracing corroborates this rhythmic disturbance. There is no thyroid struma and there are no nodules palpable. The basal metabolic rate is minus 8 and the blood cholesterol is 333 mg. normal 140 to 170 mg. Her blood pressure is 110/80. There are no demonstrable foci of infection. The attacks respond promptly to 15 to 20 grains (1 to 1.3 Gm.) of quinidine sulfate. Is quinidine sulfate detrimental to the acoustic nerves of the fetus? Does this constitute a contraindication? If it does, what medication is suggested for the attacks or in the interim? Discussion of the etiology, not only in regard to the thyroid but as to the other possible causes will be appreciated.

John F. Raney M.D., Anderson, S. C.

ANSWER—There are no published reports on the effect of quinidine sulfate on the acoustic nerves of the fetus. However, quinine, another of the cinchona bark derivatives, when given in large doses, may cause functional impairment of the eighth nerve (Goodman, Louis, and Gilman, Alfred, *The Pharmacological Basis of Therapeutics*, New York, Macmillan Company, 1940, p. 91). Correspondingly large doses administered to pregnant experimental animals have been shown to produce degenerative changes in the myelin sheath of the acoustic nerve (Covell, W. P., *A Cytologic Study of the Effects of Drugs on the Cochlea*, *Arch. Otolaryng.* 23:633 [June] 1936; West, R. A., *The Effect of Quinine on the Auditory Nerve*, *Am. J. Obst. & Gynec.* 36:241 [Aug.] 1938).

Although quinidine in large doses as well as quinine may give rise to symptoms of cinchonism, doses as small as 15 to 20 grains of quinidine sulfate should not be harmful to the patient or fetus (unless there is an idiosyncrasy to the drug). There is therefore no reason for discontinuing the quinidine therapy.

Alternative treatment would be full digitalization in the interim between attacks (1½ grains [0.1 Gm.] three times a day for a week, depending on the reaction of the patient) with subsequent maintenance dosage varying with the needs of the patient (1½ grains daily).

Paroxysmal auricular fibrillation occurs frequently in association with hypertensive, arteriosclerotic and rheumatic heart disease before the fibrillation becomes chronic. Its relationship to thyrotoxicosis is well established. When organic heart disease is not present, many varied conditions have been suggested as contributory and precipitating factors. These have been classified by Organ, Wolff and White (*Uncomplicated Auricular Fibrillation and Auricular Flutter*, *Arch. Int. Med.* 57:493 [March] 1936) into (1) toxic factors including (a) infections (such as pneumonia), (b) drugs (epinephrine, digitalis, ether), (c) other chemical agents (carbon monoxide, alcohol, tobacco), (2) traumatic factors, (3) reflex mechanisms (secondary to appendicitis, gallbladder colic), (4) exertion, (5) neurogenic influences including mental excitement and emotional disturbance.

When organic heart disease is excluded, paroxysmal auricular fibrillation is as benign as paroxysmal tachycardia of supraventricular origin.

Since nervous excitement and emotional strain have been frequently cited as precipitating attacks of paroxysmal auricular fibrillation in susceptible individuals, reassurance of this patient alleviation of her fears or the emotional strain aroused by the pregnant state are important adjuncts to therapy and together with quinidine or digitalis prophylactically, should reduce the frequency of the attacks.

SUBCUTANEOUS EMPHYSEMA AFTER DELIVERY

To the Editor—I have a patient who two days after delivery showed rather pronounced cervical and upper thoracic emphysema of the subcutaneous tissues. X-ray examination showed that the emphysema extended into the mediastinum but there was no evidence of pneumothorax. Delivery was spontaneous and uncomplicated except for the fact that the patient's response to anesthesia (gas oxygen-ether) was bad being accompanied by much retching, vomiting and coughing. I should like you to explain the mechanism in this case.

Captain M. C. A. U. S.

ANSWER—Emphysema of the cervical and upper thoracic, as well as the mediastinal subcutaneous tissues, usually arises as a result of trauma to the trachea or esophageal passages. There is rarely evidence of pneumothorax in these cases. This trauma may be so trivial that a careful examination may fail to reveal it. In the resuscitation of the newborn, similar emphysema may develop without gross evidence of the trauma in the trachea or the esophagus at necropsy. It is possible that the retching and coughing associated with the anesthetic produced the trauma which provided the avenues for the escape of the gas into the subcutaneous tissues.

not one of them was a good source of either virus or immunizing antigen for these two viruses. A study of the titers developed in several stocks of available mice indicated no significant differences. In general the highest titers were most regularly obtained in the brains of intracerebrally inoculated 2 to 3 week old mice. As regards the utilization of susceptible hosts of larger size, it was found that while the Syrian hamsters yielded titers of virus that were almost but not quite as high as those achieved in mice, their brains were only about twice as large as those of mice. The horse was not investigated as a source of St. Louis encephalitis virus because of the very low titer of virus developed in its brain. Newborn lambs and young sheep were studied as a possible source of the Japanese B virus, but their brains were found to contain too small an amount of virus.

(b) *Selection of Strain of Virus*—The strain of virus used was found to be an important factor. Of the three strains of St. Louis encephalitis virus tested, the No. 3 isolated in 1933 (obtained from Dr. L. I. Webster) the 'Hubbard' isolated in 1937 (obtained from Dr. Margaret Smith) and the "Taylor" isolated in 1937 (obtained from Dr. Carl G. Hartford) the Webster No. 3 yielded ten to six times as much virus as the other two strains in simultaneous tests on mice of the same stock and age. In tests for immunogenic potency of the inactivated viruses the "Taylor" strain was definitely inferior to the other two. Of the two strains of Japanese B encephalitis virus tested the No. 12 obtained from Dr. L. I. Webster and the Nakayama obtained from Dr. Margaret Smith the Nakayama strain regularly yielded at least ten times as much virus as the Webster No. 12 and on complete inactivation of the virus the "Nakayama" strain yielded an adequate immunogenic vaccine while the other strain did not. Thus the Webster No. 3 strain of St. Louis encephalitis virus and the "Nakayama" strain of Japanese B encephalitis virus were chosen for the vaccines.

(c) *Effect of Centrifugation*—The effect of centrifuging the mouse brain suspensions on the virus content and antigenicity of the supernatant liquids was studied extensively with both viruses. In the case of the Japanese B virus repeated tests failed to show any difference in virus titer between the uncentrifuged suspension and the clear supernatant liquid obtained after spinning this suspension on a Swedish angle centrifuge at 3 000 revolutions per minute for thirty minutes. The uncentrifuged suspension nevertheless yielded a more potent vaccine. With the Webster No. 3 strain of St. Louis virus the uncentrifuged suspensions regularly yielded higher titers (three to ten times higher) than even the opalescent supernatant liquids obtained after horizontal centrifugation at about 2 000 revolutions per minute for ten minutes. Here again the results of a number of tests indicated that the uncentrifuged suspensions yielded the more potent vaccines. The intracerebral LD_{50} titers of four St. Louis encephalitis uncentrifuged vaccines were $10^{-8.2}$, $10^{-8.6}$, $10^{-8.3}$ and $10^{-8.0}$. The titers of the Japanese B vaccines were usually of the same order of magnitude.

CHOICE OF METHOD OF VIRUS INACTIVATION

Solution of formaldehyde, ultraviolet radiation, ozone and "soft" x-rays were studied for their capacity to inactivate these viruses with the least loss of antigenicity. The effect of different concentrations of solution of

formaldehyde acting at different temperatures was investigated. It was found (a) that both too little and too much could yield poorer antigens and (b) that, while inactivation entirely in the cold (2 to 6 C) was capable of yielding a satisfactory vaccine, exposure of the same material to room temperatures of 23 to 25 C for two days resulted in a practically worthless vaccine. The results of many tests indicated that a final concentration of 0.2 per cent solution of formaldehyde acting at 2 to 3 C yielded the best preparations.

The effect of ultraviolet irradiation (Hanovia Chemical Company spiral quartz-mercury resonance lamp, said to emit about 85 per cent of the energy in the line of 2 537 angstrom units) was studied on relatively clear angle centrifuged as well as on somewhat opalescent horizontal centrifuged preparations. In the case of St. Louis encephalitis virus the minimal amount of radiation required for complete inactivation of the virus resulted in the complete or almost complete destruction of its immunogenic capacity. Simultaneous tests on aliquot portions of the same St. Louis virus preparation indicated that treating with formaldehyde according to the procedure described yielded a satisfactory vaccine while ultraviolet radiation did not. Ultraviolet irradiation did not destroy the antigenicity of the Japanese B virus but in comparative tests the vaccines produced by this method were no more potent and were often less potent than those produced by suitable treatment with formaldehyde. There was a wide range of safety in irradiation of the Japanese B virus since preparations which because of insufficient exposure, still contained small amounts of infective virus were no better as vaccines than preparations which had been irradiated for twenty to forty minutes more than was necessary to inactivate the virus.

The effect of ozone and of "soft" (long wavelength) x-rays was studied in collaboration with Dr. Harold J. Keirsten of the Department of Physics of the University of Cincinnati in the hope of finding a chemical or physical method that would inactivate the virus and yield more potent vaccines than those obtained with the aid of solution of formaldehyde. Ozone gas, freshly prepared by the passage of a strong electric current through oxygen and bubbled into clear, angle centrifuged virus preparations required more than one and less than two hours for complete inactivation of the virus, and the antigenicity was apparently destroyed along with the virus. With the "soft" x-rays there was no evidence of inactivation after exposure for four hours unless a very thin layer of about 1 to 2 mm of the clear, angle centrifuged virus was used. Since no more than 1 cc could be handled at one time and the relatively large amounts required for assay and study could not be treated without great difficulty this approach was abandoned as unpractical at the present time.

QUANTITATIVE ASSAY OF THE VACCINES

The desirability of testing the extent of resistance produced by the vaccines within one week and under conditions which may be considered comparable to those obtaining in nature necessitated devising a method of assay based on infection by the subcutaneous, intraperitoneal or intravenous routes. Studies on both the St. Louis and Japanese B viruses have revealed that resistance to infection by peripheral routes, other than the intranasal, develops spontaneously as mice grow older. This spontaneous maturation resistance was found to develop at different times and to different extents for the subcutaneous (or intramuscular),

intraperitoneal and intravenous routes. Considerable susceptibility to infection by the intraperitoneal and intravenous routes remains when resistance to subcutaneous or intramuscular infection is practically complete, and when the peak of spontaneous resistance is attained there is greater susceptibility to infection by the intravenous than by the intraperitoneal route. However, because of the greater ease of inoculating large numbers of mice by the intraperitoneal route and because a suitable age period was found during which it was possible to carry out quantitative titrations of susceptibility, this route of infection was chosen for testing the resistance produced by the various vaccines. This method of assay was also facilitated, if not actually made possible, by the use of virus suspensions of the highest possible intracerebral titers. Because there were occasional carriers of pathogenic enteric organisms among the stock of mice we used, the virus-containing brain suspensions were occasionally contaminated and would spoil a whole test. To have a source of known bacteria free virus of the highest possible titer it was necessary to resort to a special method of preserving the virus. The brains of infected 2 to 3 week old mice were ground to a 10 per cent suspension with undiluted rabbit serum which had been inactivated at 56 C. The uncentrifuged suspension, distributed in rubber capped vaccine bottles, was quickly frozen in a mixture of carbon dioxide and alcohol and stored in a box containing solidified carbon dioxide. On thawing and centrifuging these preparations at any time during a period of at least two months we obtained virus suspensions with intracerebral titers as high as or higher than those of fresh virus. We also found that some batches of broth could be highly toxic for the smaller concentrations of virus and therefore used 10 per cent rabbit serum in saline solution for the preparation of all dilutions.

In general two methods of assay, based on resistance to infection by the intraperitoneal route, were used: (1) a so-called "complete assay" in which 3 to 4 week old mice received graded doses of vaccine and one week later were tested for immunity with various doses of virus, and (2) a so-called "screening test" requiring a smaller number of animals, in which 8 to 12 week old virgin female mice received various doses of vaccine and one week later were tested for immunity with a single large dose of virus representing as a rule 10^8 intracerebral and 10 to 20 intraperitoneal LD₅₀ doses. In the case of St. Louis encephalitis virus the best results were obtained when, at the time of vaccination, the mice were close to 4 weeks old and were selected individually to weigh not less than 11 nor more than 13 Gm (this weight may be different for other stocks of mice). Mice younger than 3 weeks of age were not used because they did not develop as good an immunity in one week, while mice older than 4 weeks were not used for the "complete assay" because at the time they were tested for resistance one week later the intraperitoneal titer of the virus was usually not high enough in the unvaccinated controls. Using virus suspensions with intracerebral titers of $10^{-8.0}$ or more, the intraperitoneal titers in the unvaccinated controls ranged between about 1:750 to 1:1,500. The intraperitoneal titrations were therefore carried out with fourfold dilutions of the St. Louis virus, and with mice selected by age and weight as described it was possible to obtain regularly graded results ranging between 100 per cent mortality and 100 per cent survival.

The Japanese B virus behaved differently in that it was pathogenic for approximately 4 week old mice in much smaller amounts by the intraperitoneal route. Thus on some occasions a single intracerebral LD₅₀ dose injected intraperitoneally produced fatal infection in 30 per cent of the mice. The best results were obtained when the mice selected for vaccination were 21 to 24 days old and for the stock we used weighed not less than 9 Gm nor more than 11 Gm. For the most part, however, mice of this age and size, when tested one week later, represent a population of uneven susceptibility (a situation which is undoubtedly also encountered in nature, in man, and other hosts), i. e., the majority are still susceptible to relatively minute amounts of virus given intraperitoneally while others may already be resistant to as much as 10^2 or 10^6 times that amount. For this reason it proved necessary to use about 10 mice for each dilution of virus in the intraperitoneal test and to inoculate the controls with tenfold dilutions extending to 10^{-8} or 10^{-10} and the vaccinated mice with 10^{-1} to 10^{-7} . This high susceptibility of a large proportion of mice to intraperitoneal injection of Japanese B virus disappears by the sixth week of life, and between the sixth and eighth weeks of life the resistance to large amounts of this virus may be greater than to similar amounts of the St. Louis virus. For this reason the simpler "screening" test with older mice, which has proved most valuable with the St. Louis virus, has frequently given poor results with the Japanese B virus. Because in several tests on large numbers of mice which were 4 to 7 months old the intraperitoneal injection of approximately 10^8 intracerebral LD₅₀ doses resulted in fatal infections in 95 per cent of the mice, the possibility that mice of this age may perhaps be more susceptible than those which are approximately 2 months old must still be investigated.

EFFECTS OF ST. LOUIS ENCEPHALITIS VACCINE IN MICE

Horizontal or angle centrifuged as well as uncentrifuged 10 per cent mouse brain suspensions inactivated by 0.2 per cent solution of formaldehyde at 2 to 6 C were capable of giving rise to significant resistance against infection by the intraperitoneal route within one week after the intraperitoneal injection of a single dose of vaccine. The results presented in table 1 show (a) the degree of resistance produced by a single dose of St. Louis vaccine, (b) that resistance is apparent after subcutaneous as well as after intraperitoneal vaccination although the latter route is more effective and (c) that the nonspecific effect of the intraperitoneal injection of brain tissue is negligible since the administration of the Japanese B vaccine by this route produced no significant resistance to infection with the St. Louis virus. The specificity of the induced resistance was further established when it was shown in simultaneous tests that the same Japanese B vaccine produced effective resistance against the Japanese B virus while the St. Louis vaccine did not. Additional evidence that the immunity produced by the St. Louis vaccine was systemic rather than local was obtained when it was found that mice developed resistance to infection by the intravenous route after introduction of the vaccine into the peritoneal cavity.

The results of many quantitative tests with single doses of vaccine indicated that while it was possible to establish significant resistance in one week even with amounts of vaccine as small as 0.03 cc, the develop-

ment of immunity was not uniform in all the animals, since a certain number invariably remained susceptible to infection. While it is a well established fact that multiple doses of noninfective vaccines produce a stronger immunity, it was necessary to determine how much could be accomplished by this means within a period of a week. A number of preliminary tests indicated that the immunity engendered in one week by a given small dose of vaccine was decidedly increased

zontal centrifuged vaccine prepared from the same lot of mouse brains. In this particular assay the total dose of 0.003 cc of the uncentrifuged vaccine still induced a significant immune response in that the mice were able to resist eighteen times as much virus as the unvaccinated controls. The results of many tests have indicated that by this method of assay the best vaccines we have been able to prepare have had a minimal immunogenic dose of 0.01 to 0.003 cc.

All the mice used in these tests were close to 4 weeks old and each was chosen by weight, with few exceptions not less than 11 Gm nor more than 13 Gm.

* The second dose was given 3 days after the first in each instance.

† The second dose was given 3 days after the first in each instance.

‡ The intracerebral titer of this virus suspension was $10^{4.5}$ to $10^{4.6}$ cc.

§ The intracerebral titer of this virus suspension was $10^{4.5}$ to $10^{4.6}$ cc.

when the total amount was administered in two equal doses three days apart. The results presented in table 2 show not only that, by administering the total amount of vaccine in two doses in this manner, it is possible to produce a solid immunity against infection with the largest test doses by the intraperitoneal route, but also that the same amount of vaccine can be about thirty times more effective within one week when it is administered in two doses rather than in a single dose. Thus, in the case of two types of vaccine in series P, 0.01 cc given in two doses produced as much immunity as 0.3 cc administered as a single dose. The data in table 2, furthermore, indicate the better protective capacity of the uncentrifuged as compared with the hori-

zontal centrifuged vaccine prepared from the same lot of mouse brains. In this particular assay the total dose of 0.003 cc of the uncentrifuged vaccine still induced a significant immune response in that the mice were able to resist eighteen times as much virus as the unvaccinated controls. The results of many tests have indicated that by this method of assay the best vaccines we have been able to prepare have had a minimal immunogenic dose of 0.01 to 0.003 cc.

to give rise to solid resistance against infection by the intracerebral route, reported in the early years after its isolation, has been lost on passage. Tests which we have carried out with the "Hubbard" and "Taylor" strains of St. Louis virus which were isolated in 1937 indicated that they also gave rise to poor or irregular intracerebral resistance after a single injection of live virus.

residual solution of formaldehyde sufficient ammonium hydroxide was added to the vaccines to bring the p_H to about 8.2, their immunogenic potency diminished so rapidly on storage in the refrigerator that at the end of one month the vaccines were practically worthless. Subsequent studies showed that horizontal centrifuged or uncentrifuged vaccines containing 0.2 per cent solution of formaldehyde retained their original potency as

TABLE 3—Resistance of Mice to Intracerebral Inoculation of St. Louis Virus After Administration of Uncentrifuged Formaldehyde Treated Vaccines

Vaccine	Doseage		0.03 Cc of Indicated Dilution of Virus Injected Intracerebrally					LD ₅₀ Titer Log of Dilution	Immunity Index
	Total Cc	Individual	10 ⁻²	10 ⁻³	10 ⁻⁴	10 ⁻⁵	10 ⁻⁶		
Inactivated controls								7.6	
R 0.2% solution of formaldehyde	0.5	0.2 x 4	5/10	8/3	6/10	5/10	0/9	5.5 - 9	125 - 7
R 0.4% solution of formaldehyde	1.0	0.2 x 5	5/9	4/10	1/11	1/10		5.4 - 9	160 - 9

The mice used in this test were approximately 3 weeks old virgin females at the time of vaccination. The first 3 doses of vaccine were given at 45 hour intervals and the others after a rest period of 4 days. The intracerebral test for resistance was carried out 3 weeks after the first dose of vaccine.

* Administered in two doses as indicated in table 2

The formaldehyde treated noninfective vaccines were also found to give rise to neutralizing antibodies in mice. The neutralizing antibody response against the St. Louis virus in mice even when living virus is used is of a low order and irregular, except after multiple doses and may not be demonstrable in mice which are actively resistant to infection.

STABILITY OF ST. LOUIS ENCEPHALITIS VACCINES

It was found early during the course of this work that when to reduce the irritating properties of the

determined by quantitative tests for five months or longer when they were stored in a refrigerator (2 to 3 C) in the fluid state without neutralization of the formaldehyde. That a certain amount of residual formaldehyde is necessary for the preservation of the potency of these vaccines was further proved by the fact that complete neutralization of the formaldehyde by means of sodium bisulfite without adjusting the p_H to neutrality or slight alkalinity also resulted in a definite drop in the immunogenic potency of the vaccine when it was stored in the fluid state. Because the untreated and unneutralized formaldehyde vaccine gives rise

to pain and local reactions on inoculation in human beings, and because it could not be expected to retain its stability unless it was shipped under refrigerated conditions, an attempt was made to obtain a more suitable preparation by lyophilization.

When formaldehydized mouse brain suspensions such as we used, with or without added ammonium hydroxide, are dried from the frozen state they become denatured to such an extent that rehydration is practically impossible. We are indebted to Mr. Willard G. Webster of Sharp and Dohme, Inc., for the suggestion that this denaturation can be avoided when sodium bisulfite is used for neutralization of the formaldehyde. Tests of various preparations on human volunteers indicated that in order to eliminate the pain and local reactions it was necessary to adjust the pH to about 7.3 as well as to neutralize the formaldehyde. The final procedure adopted for lyophilization of the uncentrifuged vaccine was therefore as follows:

1. After the infectivity of the virus has been destroyed and the intracerebral titration has indicated the presence of a

However, it is noteworthy that storage at 37.5 C and high humidity for a period of seven to ten days did not appear to diminish significantly the potency of such lyophilized vaccines, although longer periods of storage under these conditions were definitely detrimental. The indications are, however, that storage of the lyophilized vaccines under refrigerated conditions should preserve their potency for long periods of time.

Most of the quantitative tests on the stability of different types of St. Louis vaccines were carried out by the simpler "screening" method of assay, but basic results were confirmed by the more complete assays in younger mice. The data presented in table 4 show results obtained in the "screening" tests on several vaccines. It may be seen that with only occasional exceptions it is possible to obtain cleancut endpoints and reproducible values for the minimal immunogenic dose. The potency of a St. Louis encephalitis vaccine may be checked conveniently by this simpler method at frequent intervals, and a satisfactory vaccine should have a minimal immunogenic dose which is not less than 0.01 cc.

* Approximately 3 to 4 week old mice used in this test.

† The infectivity of samples taken at different times during the ultraviolet irradiation was as follows: 20 minutes, 3/10; 30 minutes, 0/10; 40 minutes, 0/10.

‡ Infectivity tests on the ozone treated material were as follows: One hour, 10/10; 2 hours, 0/10.

satisfactory titer of virus before inactivation at any time after a period of eight to fourteen days, sufficient powdered sodium bisulfite is added to neutralize the residual formaldehyde completely. The Schryver test for formaldehyde is used as a check after diluting the vaccine 1:10 with distilled water, because the suspended brain tissue interferes with the reaction. Three to 4 mg of sodium bisulfite per cubic centimeter of vaccine was usually sufficient.

2. The pH, which is about 6.6 at this stage, is adjusted to about 7.3 with sodium hydroxide.

3. Enough of a 1:100 solution of phenylmercuric borate is then added for antiseptic purposes to yield a final concentration of 1:50,000.

4. After removal of appropriate amounts for aerobic and anaerobic cultures and for intracerebral infectivity tests, the remainder of the vaccine was immediately distributed in lyovac containers, frozen in a mixture of solidified carbon dioxide and alcohol, and dried from the frozen state.

5. On completion of the lyophilization in twenty-four to forty-eight hours, the rubber stopper and glass sealed, evacuated ampules were stored in the refrigerator at 2 to 3 C.

Many tests on vaccines lyophilized in this manner showed that the potency was either fully preserved or only slightly diminished. It cannot be said that the mechanical conditions of lyophilization were optimal in our laboratory and it is not improbable that more adequately dried preparations could be obtained under the superior conditions obtaining in large scale production.

EFFECTS OF JAPANESE B ENCEPHALITIS VACCINES IN MICE

In general the basic properties exhibited by the St. Louis encephalitis vaccines obtain also for the Japanese B vaccines, except that the angle centrifuged preparations of the latter as a rule contained more virus before inactivation (10⁸ LD₅₀ doses or more per 0.3 cc) and possessed greater immunogenic potency. The data presented in table 5 on the immunogenic capacity of several different types of noninfective vaccines prepared from the same lot of angle centrifuged mouse brain virus clearly show the superiority of the formaldehyde method over ultraviolet irradiation and the practically negative results obtained when ozone was used to inactivate the virus. It may also be seen that the formaldehyde treated vaccine dried from the frozen state according to the procedure previously described produced excellent protection within one week even after a single dose of 0.03 cc. The fact that in the fluid preparation of the same vaccine the formaldehyde was neutralized with sodium bisulfite six days before it was used may perhaps account for the poorer resistance it produced with the 0.03 cc dose. It is noteworthy that the protection afforded by a single dose of the vaccine is just as definite at two months as at one week and may still be demonstrable six months after vaccination.

Since ultraviolet light has come to be regarded by many as being capable, under suitable conditions, of abolishing infectivity of the virus with the least deterioration in the antigenicity of the preparation, studies were carried out to determine to what extent the antigenicity diminished when the irradiation was carried beyond the minimal time required for the inactivation of the virus. Portions of the same angle centrifuged preparation of virus were distributed into four quartz tubes, which were irradiated one at a time, the course of virus inactivation being determined separately at given inter-

previously described procedure. That there are limits to this stability, however, is shown by the tenfold drop in potency which was demonstrated to occur when some of the ampules containing the lyophilized vaccine were stored in an incubator at 37.5 C and high humidity for a period of seventeen days (table 7).

The most reliable method for assaying the immunogenic potency of the Japanese encephalitis vaccine is illustrated in a protocol presented in table 8. The various amounts of vaccine are administered intraperitoneally in two doses three days apart and the

vals in each tube. The data presented in table 6 show that while twenty-five to thirty minutes was required to inactivate the virus, preparations which had been irradiated for twenty, twenty-five, thirty or forty minutes did not vary significantly in their capacity as vaccines. It was thus quite clear that even when the least possible amount of ultraviolet irradiation was used, it was not possible to obtain a better vaccine, and seemingly not even as good a one, as could be prepared by proper treatment with formaldehyde.

Japanese B encephalitis vaccines in which part of the formaldehyde and the acidity were neutralized by ammonium hydroxide were just as unstable on storage in the refrigerator as the St. Louis encephalitis vaccines. Here again it was possible to obtain satisfactory stability by lyophilization according to the

mice are tested for resistance by the intraperitoneal route with tenfold dilutions of virus one week after the first dose of vaccine. The mice are observed for a period of three weeks after inoculation of the virus and the results shown in table 8 indicate that even the 0.001 cc. dose of vaccine produced a significant increase in resistance. It should be noted here that it is difficult to define precisely the numerical value of an immunity index that may be regarded as indicating the least amount of significant resistance in this type of test, but for practical purposes a minimal value of 100 was selected. Because the degree of susceptibility of the mice used in a given test determines not only the titer of the virus in the control animals but also the size of the immunity index, the chief usefulness of the index is limited to a comparison of the values obtained with

different doses of the same or different vaccines in the same test (table 9). Vaccines possessing a minimal immunogenic dose of 0.003 to 0.001 cc., as determined by this type of assay, are the best that have been achieved thus far.

It proved quite difficult to produce significant resistance to infection by the nasal route and even more so to infection by the intracerebral route. At least three doses of 0.2 cc. each had to be administered to approximately 2 month old mice to produce resistance against 10 to 100 intranasal fatal doses, while even five doses, 0.5 cc. each of formaldehyde treated angle centrifuged vaccine failed to give rise to significant resistance to intracerebral infection. However, five doses of 0.2 cc. each of the uncentrifuged vaccines protected the majority of mice against ten fatal intracerebral doses. In general, most groups of mice inoculated with the various types of formaldehyde treated vaccines developed significant amounts of neutralizing antibodies although the titers varied considerably in different groups of animals.

and medical students, received subcutaneously various doses and preparations of one or the other of these vaccines, and tests for neutralizing antibodies were carried out on serums obtained from them before and at various intervals after vaccination. There were no systemic reactions, and when the lyophilized preparations, in which both the formaldehyde and the acidity were neutralized, were administered in 2 cc. doses the pain of the injection and local reactions was also eliminated. There were no hypersensitive local reactions when the second dose of 2 cc. was administered three days after the first, but some were encountered when the interval was one week. Of various types of St. Louis encephalitis vaccines that were tested the uncentrifuged lyophilized preparation was the only one to stimulate antibody production in human beings. Even in this group the antibody response was evident in only 50 per cent of the individuals at two weeks, and there was no difference, in the small group that was studied, between those

* The Reed-Muench accumulation formula for calculating the 50 per cent mortality endpoint was used here despite the fact that the data are not suited for this method because there is no regular gradation from 100 per cent mortality to 100 per cent survival. The method however provides convenient mathematical expressions which may be used for comparative purposes. Actually by inspection of the data it is evident that the adequately vaccinated mice are resistant to 100,000 to 1,000,000 times the amount of virus that is fatal to about 50 per cent of the unvaccinated controls.

EFFECT OF ST. LOUIS AND JAPANESE B ENCEPHALITIS VACCINES ON HUMAN VOLUNTEERS⁷¹

The purpose of testing these vaccines on human beings was to determine (a) the safety with which they may be administered and the type of local or systemic

receiving two doses of 2 cc. or two doses of 5 cc. (table 10). Those who had no response at two weeks were negative also at six weeks, and at least 1 who was distinctly positive at two weeks (A. Ber., table 10) became distinctly negative at six weeks. Since we as well as others have found that resistance to infection with St. Louis encephalitis virus can be present in the absence of demonstrable neutralizing antibodies, we are not inclined to draw any conclusions from the human data beyond the one that two doses of 2 cc. of the uncentrifuged lyophilized St. Louis vaccine contains enough antigen to stimulate a neutralizing antibody response in a certain proportion of adult human beings. For this reason we would also be inclined to use this dosage in any field trials with this vaccine in human beings.

In the case of the Japanese encephalitis vaccine a definite neutralizing antibody response was obtained with angle centrifuged lyophilized vaccine, and one may therefore expect an even better response with the uncentrifuged vaccine. Considerable difficulty was encountered in obtaining suitable human volunteers for the Japanese encephalitis neutralizing antibody studies, because tests for this antibody on over 80 "normal" adults from the Cincinnati region, including only a few laboratory workers exposed to the virus, revealed an unusually high incidence of positive results comparable in titer to those recorded for patients convalescent from the disease in Japan. The perplexing character of the data is well illustrated by the results of tests on 150

reactions that might be expected and (b) the amount that may represent an adequate antigenic stimulus. A total of 51 volunteers, consisting of laboratory personnel

⁷¹ Members of the staff of the Children's Hospital Research Foundation and members of the second and third year classes of the University of Cincinnati College of Medicine offered themselves without any reservation as subjects for these studies.

groups of students from the University of Cincinnati College of Medicine. Among one group of 29 third year students bled on Aug 13, 1942 there were 2 with distinctly positive serums against the Japanese virus (neutralization indexes of 100 to 600) while all the others were just as distinctly negative with neutralization indexes not exceeding a value of 5. The positive results were reproducible not only on the same specimens of serum but also on subsequent specimens obtained on Sept 2, 1942. One of these positive serums also neutralized the St Louis encephalitis virus while the other one did not. Twelve of the "negative" students were selected to receive the Japanese encephalitis angle centrifuged lyophilized vaccine, and additional prevaccination specimens obtained on August 27 were again negative. Seven of these 12 students however, showed neutralizing antibodies (indexes ranging from 25 to 2,500) two weeks after vaccination. In a search

SUMMARY AND COMMENT

The essential features of the St Louis and Japanese B encephalitis vaccines described in the present communication are as follows:

1 Strains of virus were selected which yielded high titers in the brains of 2 to 3 week old mice and which were found to be more antigenic than others tested. Various portions of embryonated eggs, and the brains of hamsters and young sheep were found to be unsatisfactory, for one or another reason, as the source of virus for the vaccines.

2 The vaccines consist of uncentrifuged 10 per cent mouse brain suspensions in isotonic solution of sodium chloride in which the virus has been rendered noninfective by 0.2 per cent solution of formaldehyde, the entire process of inactivation having taken place in the cold (2 to 3 C). Other methods of inactivation including ultraviolet light and ozone were unsatisfactory. Vac-

* Neutralization index = $\frac{\text{LD}_{50} \text{ titer of virus in control serum virus mixture}}{\text{LD}_{50} \text{ titer of virus in test serum virus mixture}}$

for suitable volunteers to receive the uncentrifuged Japanese vaccine, a group of 21 second year students were bled on Dec 3, 1942 and positive tests for Japanese B "antibody" were obtained on 18 of the 21 serums. Only 1 of these 18 serums also neutralized the St Louis virus. These positive results with the Japanese virus were reproducible on the same specimens of serum and with one exception also on subsequent specimens obtained on Dec 21, 1942 or Jan 12, 1943. There were even some "rises" in titers in a few instances on subsequent tests, which, if the students had been vaccinated, might have been attributed to the vaccination.

It is obviously difficult to interpret these data. Either the Japanese B virus is widely distributed in the United States and has not yet been isolated (which we doubt) or else certain human beings may possess the capacity of inactivating this virus without having been exposed to it. Certain other studies which we have carried out in this laboratory on hamsters and rats born and raised under isolated conditions and tested for neutralizing antibodies against St Louis encephalitis or vesicular stomatitis virus respectively indicated that the latter possibility is not altogether improbable.

cines in which most of the brain tissue was removed by centrifugation were not as potent.

3 The vaccines retained their original potency only when they were stored in the cold without neutralization of the residual formaldehyde but not when the formaldehyde and acidity were neutralized sufficiently to permit their use in human beings without undesirable reactions. This difficulty was overcome by lyophilization of the vaccines according to the following procedure: (a) addition of sufficient sodium bisulfite to yield a negative Schryver test for formaldehyde; (b) neutralization of the acidity with sodium hydroxide to a pH of about 7.3; and (c) addition of phenylmercuric borate to a final concentration of 1:50,000 as an antiseptic.

The resulting product is readily rehydrated and on inoculation in human beings is essentially free of pain and local reactions.

4 These vaccines were effective chiefly in producing resistance against infection by peripheral routes such as the intravenous or intraperitoneal. Only when large amounts and multiple doses of the uncentrifuged vaccines were given to mice was it possible to induce resistance to 10 to 100 minimal lethal doses of virus by the intranasal or intracerebral routes. For this rea-

son the antigenic potency of these vaccines is assayed quantitatively in mice by determining the minimal dose required to produce significant resistance to infection by the intraperitoneal route within one week. The potency of the best St. Louis vaccines was such that 0.01 to 0.003 cc. (administered in two doses three days apart) fulfilled this criterion while in the case of the Japanese encephalitis vaccines the minimal immunogenic dose was 0.003 to 0.001 cc. While single doses produced significant resistance to intraperitoneal infection within one week, it was found that the administration of the total amount of vaccine in two equal doses three days apart produced an immunogenic effect within one week equivalent to that obtained with thirty times that amount of vaccine given as a single dose.

5 Tests on human volunteers indicated that two doses of 2 cc. given three days apart could be administered without fear of local or systemic reactions and that this amount of vaccine contained enough antigen to stimulate the development of neutralizing antibodies in about 50 per cent of adults.

It is conceivable that in the face of a very severe developing epidemic of encephalitis proved to be caused by either one of these viruses it may be desired to test the effectiveness of such vaccines in protecting human beings against these diseases. It is obvious that no such tests will be possible unless sufficiently large amounts of these vaccines are prepared ahead of time and maintained under suitable conditions of storage with repeated assays at appropriate intervals in readiness for such an emergency. In contemplating such a step one may keep in mind the Russian experience with a similar vaccine in protecting against the spring-summer tick-borne encephalitis.⁸ From the few details available to us, it appears that the Russian encephalitis vaccine consisted of 0.5 to 1 per cent emulsion of mouse brain in which the virus was inactivated by solution of formaldehyde (1:600 to 1:750) at 2 to 5 C., and that experimentally it was also chiefly effective against peripheral inoculation of the virus. In one prophylactic experiment on human beings two doses of this vaccine (amount not indicated) were administered to 1,527 individuals residing in an endemic zone. Neither local nor systemic reactions resulted from the vaccination, and while only 2 mild cases of encephalitis occurred among the 1,527 vaccinated persons, there were 44 cases including 11 fatalities among the 2,942 nonvaccinated controls.

Bread Making—The materials that have been used in bread making range from lotus seeds in Egypt to moss in the Scandinavian countries. Potatoes in Germany, chestnuts in Italy, peas and beans in Mexico and millet in China are other unusual materials used at the present time in the making of bread. Wheat, rye and corn are the cereals most commonly used for this purpose, but barley and oats are also employed to some extent. The first breads were probably unleavened, that is made without the use of yeast or other leavening agents. The Jews, though acquainted with the use of leaven, were enjoined to use unleavened bread at the time of the first feast of the Passover (Exodus 12:15-20, 13:6-7) and its use is still a part of this ceremonial. Barley bread over 4,000 years old, in which the outlines of yeast cells were still clearly visible, has been found in Egypt—Peterson, William H., Skinner, John T., and Strong, Frank M. *Elements of Food Biochemistry*, New York, Prentice-Hall, Inc., 1943.

SOME CURRENT MEDICOMILITARY PROBLEMS

BRIGADIER GENERAL FRED W. RANKIN
Chief Consulting Surgeon
UNITED STATES ARMY

The war has now progressed to a point where every one is definitely involved in its complexities and ramifications and is committed to playing his part in the holocaust. Physicians, even earlier than most groups, became aware of the inevitable requirements and demands which would be made, or develop, as a consequence of the military, industrial and continuing civilian needs for adequate medical care. All efforts have been directed toward a single fundamental purpose, but the problems which have arisen and required solution have been multiplex and extremely variable as far as the immediate readjustments which their accomplishment has entailed. In every sphere, however, resourcefulness, flexibility of character, ingenuity, determination and at least a modicum of patience and tolerance have been required. The revamping of plans and ambitions, and the personal sacrifices involved in meeting the exigencies of our times, have tested well the normal and physical endurance and the adaptability of each of us.

That all this has been accomplished so speedily and efficiently merits a review of how such things were performed, at the same time setting forth what further will inevitably be required of medicine or physicians to assure the successful termination of this war.

With the threat of war towering and thundering upon us, the first and most urgent problem which arose and required immediate solution was to provide a skeleton crew of physicians to participate in the initial recruitment and induction of military manpower. Members of the Medical Department of the Regular Army, aided by a comparatively small group of reserve medical officers, quickly and efficiently set themselves to the task of selecting the mentally, emotionally and physically qualified nucleus of what has since become an imposing and powerful military machine.

Medical schools and hospitals throughout the country reincarnated the base and evacuation hospitals which were staffed from their ranks in World War I, thus quickly establishing a reserve force of experienced and enthusiastic physicians and surgeons whose services became immediately available. The establishment of this bulwark against epidemic disease and military casualties was cheerfully done in spite of the recognition by the affiliated institutions that the withdrawal from their faculties and staffs would seriously deplete their personnel, require drastic readjustments and impose great hardships on their functional capacities.

More than a year ago the roster of regular and activated reserve medical officers had reached an impressive figure. At present there are on active duty with the various branches of the armed forces more than 40 per cent of the usable medical personnel of the country. The subtraction from civilian life of the medical services represented by this large proportion of the normal total connotes the tremendous burden which has been placed on, and which is being so admirably borne by, the thinned ranks of the remaining civilian physicians. The parallel gigantic industrial expansion has added further to the tax placed on their physical endurance and professional capacity.

All this has been done with minimal and remarkably slight impairment of medical service to the civilian population, albeit luxury and unnecessary medical attention have been curtailed and greatly eliminated, a consequence which has inadvertently been beneficial in establishing and stimulating the development of an improved civilian morale.

The metamorphosis from civilian to military life for physicians has been rapid and has not only required changes in interests but has necessitated special training to prepare them to shoulder new responsibilities. The acquisition of hitherto unpossessed knowledge of military customs and practices has required intensive study, including reeducation in many phases of daily life, professional activities and interests. The training of medical officers has been accomplished by several methods and in various types of military installations. The traditional training ground, the Medical Field Service School at Carlisle Barracks, Pennsylvania, has been expanded to serve as the principal center for tactical and field service, officer pools including the Army Medical Center in Washington and those which have been established at various recently built general hospitals, have fulfilled an extremely useful purpose in orienting recently enlisted medical officers and have also served as liaison agencies in facilitating the staffing of new hospitals and special medical service organizations such as the Auxiliary Surgical Groups, instructional courses at the Chemical Warfare School of Edgewood Arsenal, Maryland, have been conducted in an intensive fashion to acquaint medical officers with the peculiar problems connected with the management of gas casualties, refresher courses in specialized fields of medicine including tropical medicine, general surgery, neurosurgery, thoracic surgery, maxillofacial surgery and orthopedic surgery have been provided through the cooperation of medical schools throughout the country, flight surgeon training to acquaint medical officers attached to the Army Air Forces with the unique phases in the expanding field of aviation medicine, has been greatly augmented to meet present and anticipated requirements. The magnitude of this training program and the rapid and impressive manner in which it has been initiated have been possible only because of the foresight and detailed planning of the Surgeon General and his staff along with cooperating Army organizations, the National Research Council, the universities and the many civilian groups and individuals whose interests and activities have been intimately connected with matters pertaining to the Medical Department of the Army. To promote and improve further the quality of medical service and to insure the interchange of significant observations and newly acquired knowledge, as well as to coordinate the medical and surgical activities both in the zone of the interior and in the various theaters of operations, specially qualified consultants in medicine and surgery have been assigned to the service commands in this country and to the theaters of operations abroad. Already, from the consultant groups, there have been received valuable reports which have made possible appropriate modifications of existing medicomilitary practice and the inauguration of more efficacious innovations.

CHANGE IN METHOD OF PROCURING PHYSICIANS

We have now come to a stage where it has become necessary to apply more selective criteria in the apportionment of civilian, industrial and military personnel. Accordingly, the method of procuring doctors for the

Medical Department of the Army has been changed. The method, which has been described in detail¹ in a recent issue of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, consists essentially in the establishment of an Officer Procurement Service which is the only agency authorized to solicit applications for commissions. The state chairman of the procurement service for doctors will furnish to the national headquarters of that service (the War Manpower Commission) the names of available individuals. The national headquarters will forward to the individual a notice of his availability and a card for him to sign and return to the state chairman, who will prepare proper availability clearance papers which will permit the preparation of proper application. The completely processed papers will then be sent directly to the Surgeon General. By arrangement with the national headquarters of the Procurement and Assignment Service the individual will be contacted and the card previously referred to will be furnished him in order that he may apply through the state chairman of the Procurement and Assignment Service for a commission. In the past such inquiries have been answered directly from the Office of the Surgeon General and application blanks furnished the individual, but such procedure will no longer be followed.

The Army's most urgent need is for young, vigorous and alert medical officers who comprise the vanguard of army medical service and on whom rests a burden of professional performance which must be accomplished under the most trying circumstances and adverse conditions. The duties of these officers, whose versatility must be sufficient to meet their functions as physicians, sanitarians and soldiers, far transcend the prosaic existence with which their position is commonly associated. In their capacity as physicians they must practice the healing art in respect to disease and injury, sustain and bolster the spirit of their troops, anticipate, promptly recognize and correct mental hazards which have been augmented by the extreme mechanization and mobility of modern warfare, and institute careful yet quick appraisal of individual casualties which is required in expeditious triage and in the face of rapidly developing and kaleidoscopically changing situations.

CHANGES IN THE PROGRAM OF MEDICAL EDUCATION

In order to provide sufficient numbers of medical officers to meet the requirements for our continuously expanding armed forces, radical changes in the program of medical education have become necessary. Already two effective steps have been taken. The first of these has been directed toward the acceleration of the curriculums of medical schools to the fullest extent to which such a procedure can operate without imposing undue hardships on medical students or impairing the quality and thoroughness of medical education, this program is now well under way. The second step which is just now being formulated in complete detail is the plan for assuring the constant flow of students into medical schools and subsequently securing their normal medical education. This plan has recently been described by Brig Gen Joseph N. Dalton² and consists essentially in the establishment of an Army Specialized Training Division one purpose of which is

¹ Procuring Physicians, Dentists and Veterinarians in the Field J. A. M. A. 122: 151 (May 15) 1943.

² Dalton, J. N. Premedical and Medical Education as Related to the United States Army J. A. M. A. 121: 633 (Feb. 27) 1943.

to provide carefully selected enlisted men, under government contract, the accepted training in approved schools of medicine for granting them the degree of Doctor of Medicine. The preparatory collegiate training of these soldiers, which must be acceptable to the medical schools but must be concentrated and abbreviated to meet the present exigencies, will also be obtained at contracting institutions.

These departures from established educational schedules and customs pose several problems and contain implications which stimulate thought concerning the matter of trends in medical, as well as academic, education. Many phases of the future of specialized and liberal education have for some time past held a conspicuous position in the minds of national educators. That the need for such deviations must be appreciated and accepted in view of war demand, and indeed that it is recognized by educators, is evidenced by the remarks of President Dodds of Princeton University, who accepts the idea of a moratorium on liberal and humanistic studies and who concurs with the decision that young men with exceptional capability and talent should be directed into channels in which their fullest capacity as scientists and technicians can be employed. At the same time, however, he has expressed the conviction that "the government is duty bound to do all it can to make sure that conversion to a war basis does not mean a death sentence to that part of our educational system not required in the war effort." That changes in our economic structure have already unfavorably influenced endowed institutions and are reasonably liable to cause even more critical effects which may force dependence on government subsidy understandably occasions great concern among educators.

That the mechanism whereby these modifications in the medical educational system necessitated by war should be carefully controlled and well integrated is evident from the reported readjustments already in effect in European countries. Except in England the status of medical education abroad has been subjected to radical reorganization. In Germany, early in 1939, it was considered necessary to effect drastic changes in the program of medical education and hospital training in order to meet the immediate and anticipated expanding needs of the highly militarized and the conquest aspiring Third Reich. Thus, in contrast with the established seven or eight year course of formal medical education which obtained in that country, the Germans considered it expedient not only to concentrate this program into a period of five years but also to add to the curriculum certain subjects deemed indispensable to prepare the graduates to meet fully their sociological duties under the new regimen. This program was extended further to embrace in the undergraduate curriculum the clinical training period in hospitals and thus eliminate internships. The undesirable abbreviations and substitutions entailed in this form of medical education will undoubtedly be followed by many repercussions, the most important of which is the consequent lowering of the standards of medical service. That circumstances affecting us might give rise to a situation approximating that which earlier confronted the Germans should be thoroughly realized. Accordingly, careful thought and deliberate consideration should be given the procedure of medical tutelage and the means of assuring its successful accomplishment without sacrificing unnecessarily the integrity of pedagogic background and clinical apprenticeship.

POSTGRADUATE MEDICAL EDUCATION

Postgraduate medical education as it has evolved to its present high level has already suffered a definite setback and faces further disorganization and recession because of the necessary disturbance in the resident system which constitutes the framework supporting postgraduate medical education. The urgent military need for recent medical graduates who would normally comprise the group from which residents are selected, and the necessary dislocation of those who have partially completed residencies, has inflicted a severe blow which has seriously impaired and temporarily disrupted the entire resident system and has shaken the very foundation of postgraduate medical education. Not only those residents who were called on to forfeit the remainder of their normal period of residency but also those who have been entirely deprived of an opportunity to obtain a residency have suffered by this disintegration of the resident system, and succeeding groups of medical graduates will surely feel its baneful influence until the present emergency shall have passed and postwar reconstruction accomplished. An attempt will be made to have the essential civilian resident positions filled by individuals who are not physically qualified for military service, or by women. Since, however, the majority of physically qualified medical graduates will enter military service immediately after the completion of a one year internship, it is planned that, as far as practicable, opportunities will be afforded in Army hospitals for subsequent training in specialized fields. Of interest in this connection is the fact that appropriate consideration of training and experience gained during military service will be given by the respective specialty boards. This will in some measure compensate for the deprivation of resident training which would have been obtained under peacetime conditions and will to a certain extent obviate the gap in the increasing supply of specially trained physicians. The extent to which this plan must be depended on in training individuals who have been partially or totally denied special training prior to entry into military service will, of course, be influenced by many factors, principal among which is the duration of the war.

INCREASED NEED FOR RESEARCH

That the continuance of medical research during the course of war is an essential function cannot reasonably be questioned. Indeed, the very occurrence of war greatly increases the need for research at an accelerated pace. Opportunities for certain types of research, particularly clinical investigations in traumatic lesions and epidemiologic diseases, are increased manifold and, if they are accepted and developed, permit the accumulation of data and the formation of principles and practices which find widespread application not only in meeting the immediate exigencies of warfare but also in civilian needs and postwar purposes. The origin and development of surgery have been so intimately connected with and dependent on the experiences gained in war, and the entire field of preventive medicine owes so much of its present vigor to initial strength imparted to it by military endowment, that research must be carefully nurtured and constantly encouraged despite whatever obstacles arise to threaten its integrity and progress. Indeed, in England, where the effects of this war have been felt longer and more intensely, the significance of research has been considered so valuable that medical research sections have been established at home and abroad.

SOCIAL AND ECONOMIC TRENDS

The complex connotations and inevitable implications which have suddenly loomed on the entire medical scene as a result of the drastic changes necessarily associated with war have been magnified by the tremendously forceful socioeconomic trends which characterize our time and which have preceded and still accompany the present military conflict. What effect the war will eventually have in hurrying some and retarding other developments remains conjectural, but that mighty influences are at work to effect epochal changes in the complexion of medical practice is incontrovertible. As physicians we are so engrossed in our purely professional and scientific interests that we are prone to neglect our role in current socioeconomic developments. Indeed some (too many) of us have been reluctant, even hostile, toward accepting this responsibility which is so eagerly desired by certain nonmedical groups. Such an attitude is no longer tenable and would actually jeopardize our vital function and altruistic aims so aptly expressed in a recent editorial³ in *THE JOURNAL*: "The provision of optimum health through the widest possible application of the principles of preventive medicine and the treatment of disease, and through the best possible distribution of medical services." We must face realistically the ineluctable trends in the national and international social and economic structure—trends directionally signaled by already established signposts such as "social security," "sick benefits," "unemployment insurance," "old age compensation" and various alphabetically captioned governmental agencies, and by recently lighted cressets such as certain postwar plans proposed by our government and other governments, which have already received much editorial comment. These and other widely discussed and intensively considered plans for cushioning the transitional shock from wartime to peacetime economy, and proposals for broadening the social security program and extending the nation's economic resources, merely delineate with increasing clarity the current trends in the nation's thoughts and ideas. That we are intimately involved and deeply concerned with these plans and proposals is clearly demonstrated by certain recommendations that the government, in cooperation with the medical profession, take action to enable the individual to budget medical expenses over a reasonable period and "contribute toward the costs of care according to his ability," and that federal aid be extended toward developing an adequate system of regional and local hospitals, maternal and child care and other measures to assure "adequate medical and health care for all, regardless of place of residence or income status." The elucidation of these proposals makes it quite apparent that the old system of medical practice will be considerably modified. Because of this, and the startling realization that the potentialities for both good and evil are so limitless and can be projected so far into the future of medicine both as a science and as an art, it becomes imperative in this transition period that the wise and tempered counsel of the medical profession exert its proper influence. There is some comfort and reassurance in the fact that our leaders are keenly aware of the significance and necessity for organization of medical services and participation in postwar planning.

It is becoming more and more apparent that the responsibilities in the sphere of medical practice during

the coming year will be a matter of ever increasing concern to us and will demand a degree of attention and a measure of effort far beyond that of our predecessors. The perspective and sound judgment which must come from our ranks cannot be gained without an intense interest, thorough knowledge and deliberate action on the part of every one sincerely concerned with the medical security of our country. Each of us must become thoroughly acquainted with the challenges now confronting medicine, challenges which will undoubtedly be multiplied when the current worldwide hostilities cease and the difficult reconstruction period begins. Our success in meeting these challenges will in large measure be determined and sharply delimited by the intelligence, perspicacity and zeal which we manifest in approaching and participating in the evolutionary process.

HISTOPLASMOSIS PRODUCING VEGETATIVE ENDOCARDITIS

REVIEW OF LITERATURE, WITH REPORT OF A CASE

ALBERT C. BRODERS, M.D.

GEORGE R. DOCHAT, M.D.

Fellow in Pathology, Mayo Foundation

WALLACE E. HERRELL, M.D.

AND

LOUIS D. VAUGHN, M.D.

ROCHESTER, MINN.

While studying the natives of Panama, Darling¹ was the first to describe histoplasmosis. This investigator, in fact, reasoned that a condition similar to Old World leishmaniasis should be found in this area, and as a result of these studies infection brought about by histoplasmosis was first recognized as a clinical syndrome. In 1906 Darling proposed the name "histoplasma capsulata", however, in 1908 he used the term "histoplasma capsulatum." He reported 1 case of histoplasmosis in 1906 with autopsy findings. In 1908 he published reports of 3 cases with autopsy findings, which included the case he reported in 1906. Darling found enormous numbers of small ovoid and round bodies in the liver, spleen and lymph glands in each of these 3 cases. The majority of these bodies were intracellular and differed structurally from members of the genus *Leishmania*, that is, they did not contain a chromatin rod or blepharoplast. He proposed that the name *Histoplasma capsulatum* be applied to these small organisms. Two additional reports were made by him on these 3 original cases. According to him the essential pathologic feature of the syndrome was an invasion of the endothelial cells in various parts of the body.

Histoplasmosis was not recognized again until 1926. In that year Riley and Watson² reported the first instance of the disease in the United States proper. This case originated in Minnesota.

From the Section on Surgical Pathology, Mayo Clinic (Dr. Broders) and the Division of Medicine, Mayo Clinic (Drs. Herrell and Vaughn).

Crumrine and Kessel³ in 1931 noted both the intracellular and extracellular phases of the growth of *Histoplasma capsulatum*. They also noted budding of some parasites in the cellular phase. DeMonbreun,⁴ however, was the first to grow the organism *in vitro*. The material used in his study was obtained from the blood of a 6 months old infant whose condition had been diagnosed as histoplasmosis on the basis of observation of the organisms in some of the large mononuclear cells in the blood. This case was reported by Dodd and Tompkins. DeMonbreun observed that on culture mediums the yeastlike form of *Histoplasma capsulatum* gave rise to a typical fungous growth with the production of mycelia and spores. He was further able to inoculate successfully both monkeys and mice with the fungous growth and to observe that the yeastlike structure of *Histoplasma capsulatum* was reproduced in the animal. In 1930 DeMonbreun recovered the organisms from a dog and was able to reinfect puppies with *Histoplasma capsulatum* by feeding suitable preparations of the mycelial form.

Conant⁵ in 1941 made a very comprehensive study of the life cycle of *Histoplasma capsulatum* and placed the organism in the group Moniliaceae of the fungi imperfecti. He thus recognized the fungous nature of the organism.

In reporting the fourth instance of the disease to be observed in the United States Shaffer, Shaul and Mitchell⁶ in 1939 observed the organisms in the reticuloendothelial cells of a large number of organs. This infection also occurred in an infant. The authors expressed the opinion that the disease was more common than was apparent at that time. Since 1939 the condition has been recognized more and more frequently, although little has been added to the clinical pathologic observations made by the earlier workers. McInerney⁷ in 1940 reviewed the entire subject and collected 32 cases of the disease. He also mentioned 13 cases reports of which had not been published. Early in 1942 Hild¹⁰ reported that the total number of cases reports of which had been published was 37. Seven of the 37 patients were infants less than 15 months of age.

Humphrey¹¹ has pointed out that splenomegaly is the most constant result of infection due to histoplasmosis. Splenomegaly is later followed by the occurrence of small nodules in the lungs, liver and spleen. These nodules represent collections of reticuloendothelial cells containing *Histoplasma capsulatum*. These nodules are essentially granulomas. Henderson, Pinkerton and Moore,¹² as well as Brown, Havens and Magath,¹³

stressed the point that the adrenal body is particularly susceptible to the infection. Henderson, Pinkerton and Moore further emphasized the importance of examination of the stool for the parasite in the presence of any type of undiagnosed enteritis. Reid, Scherer and Irving¹⁴ believed that sternal puncture may be useful in establishment of the diagnosis. Biopsy of a specimen obtained from enlarged lymph glands may be helpful in establishing the diagnosis.

The clinical course of the disease syndrome resulting from infection due to histoplasmosis mimics any severe systemic infection. To date the disease has been universally fatal. Severe anemia, leukopenia and splenomegaly usually are observed. Various organ systems, but particularly the gastrointestinal tract, may be involved. Lesions of the nasopharynx and throat often are present. Generalized or localized abscesses or ulcers of the skin may occur. Histoplasmosis also may give rise to chronic pulmonary infection. Asthenia and anorexia with severe loss of weight are not uncommon.

At the time of this review there was no recorded instance of involvement of the heart valves (vegetative endocarditis) due to the organism *Histoplasma capsulatum*. Such a condition has been observed and forms the basis for this report.

REPORT OF CASE

A white man aged 47, American born, first presented himself at the Mayo Clinic for examination on Nov. 27, 1941, complaining chiefly of unexplained fever of four months' duration. He had enjoyed excellent health during most of his life except for an attack of scarlet fever in his youth. Six months before his admission he had suffered from a peritonsillar abscess. This had been opened

Fig. 1—Record of patient's temperature and pulse rate to the sixth day of hospitalization.

surgically, and his recovery was uneventful. Four months before he was admitted he had been awakened by a dull, band like pain across the lower part of the abdomen which simulated the sensation caused by a distended bladder. He voided with some relief, but the pain continued for two days, extending gradually up to the right costal margin. At that time a diagnosis of disease of the gallbladder had been made, and the patient was hospitalized because of a temperature of 103 F. His treatment had consisted of hot compresses applied to the abdomen. The next day the symptoms had subsided and he returned to work within a few days. A week later he became ill again and the illness was characterized by prostration and a febrile reaction with a daily temperature as high as 102 F. Subsequent to this he had experienced generalized malaise with recurrent episodes of hyperpyrexia.

Complete laboratory studies carried out by his local physician resulted in no definite findings, although a presumptive diagnosis of "endocarditis" was made. At the time of his admission the patient's temperature was normal, although it ranged between 103 F and normal for the next six days after his admission (fig. 1). His weight was 145 pounds (about 66 Kg), which represented a loss of approximately 35 pounds (16 Kg) in four months' time. He did not appear to be acutely ill. Results of examination of the head, nose and throat were essentially negative, except for some evidence of gingivitis and a few injected portions in the lower lip. Results of examination of the thorax were negative. Examination of the heart disclosed tachycardia and a soft systolic murmur which could be heard over the precordium. Examination of the abdomen revealed some degree of tenderness in the left upper quadrant.

¹⁴ Reid, J. D., Scherer, J. H., and Irving, H. Systematic Histoplasmosis in the United States. *Science* 91: 264 (March 12) 1940.

The liver was palpable. Results of the rest of the physical examination were negative.

Repeated urinalysis disclosed a slight amount of albumin, the persistence of a few granular casts, occasional erythrocytes and occasional pus cells. The value for hemoglobin was 117 Gm per hundred cubic centimeters, and erythrocytes numbered 4,180,000. The leukocyte count was never higher than 6900. Differential counts and special blood smears disclosed only a definite shift to the left of the polymorphonuclear leukocytes and some myeloid immaturity. The Wassermann reaction was negative. Roentgenograms of the thorax revealed nothing abnormal. The sedimentation rate was 52 mm per hour. Results of five blood cultures were reported as being negative. Results of complete examination of the sputum were negative. Results of examination of the stools for parasites were negative. Results of agglutination tests for *Brucella melitensis*, *Pasteurella tularensis*, *Eberthella typhosa* and X19 strains of *Proteus vulgaris* all were negative. The tuberculin test was negative. Results of examination of a thick smear

After careful microscopic study of the sections obtained from the liver, one of us (Broders) felt that this material represented a chronic granuloma with multiple small zones of necrosis associated with scattered foreign body giant cells. In the small zones of necrosis were microscopic organisms which

Fig 3—Heart opened to show large vegetation on mitral valve

to him resembled the causative organism of histoplasmosis (fig 2).

The patient's postoperative course was relatively uneventful. Before the pathologic diagnosis had been received we administered hypodermically to the patient 1 grain (0.065 Gm) of

Fig 2—Section of tissue of liver removed for biopsy. Chronic granuloma (hematoxylin and eosin $\times 110$)

of the blood for any evidence of plasmodia were negative. A test for hepatic function revealed retention of dye of grade 2.

Because of the heart murmur and the recurrent febrile reactions, a diagnosis of "subacute bacterial endocarditis" was entertained, although because of the negative blood cultures this diagnosis was never considered to be the final one. In view of the palpable liver, the finding of retention of dye of grade 2 and the history of abdominal colicky pain which extended to the right upper quadrant it was thought wise to perform peritoneoscopy and abdominal surgical exploration to exclude the possibility of primary or secondary hepatic disease. On December 4 Dr J. M. Waugh of the Division of Surgery carried out abdominal exploration. Enlargement of the liver was found and seemed to be fairly well confined to the right lobe. The colon, appendix, stomach, duodenum, pancreas and aortic lymph nodes were all normal. The spleen was definitely enlarged. There was nothing to suggest a hepatic abscess, and although aspiration biopsy of the right lobe of the liver was carried out three times no fluid was encountered. Because of an unusual brownish discoloration, almost of a nutmeg type, specimens of tissue of the liver were taken for biopsy. The operation was terminated as a simple exploration.

Fig 4—Vegetation on the aortic valve showing colonies of *Histoplasma capsulatum* (vegetation on the mitral valve presented an identical picture) (hematoxylin and eosin $\times 110$)

emetine three times daily for three days. Interestingly enough, the patient's temperature during the time he was receiving emetine was never higher than 99 F. After the pathologic diagnosis of histoplasmosis had been arrived at on the basis of biopsy specimens of the liver, no further antiamoebic

therapy was employed. Aside from supportive treatment and general measures for the patient's comfort, no attempt at specific therapy was made. Fourteen days after the abdominal surgical exploration he was dismissed from the hospital and allowed to return home. After his return home he received a course of antimony and potassium tartrate in amounts of 0.5 cc of a 1 per cent solution. This amount was administered daily for a trial period of six or eight days. All attempts at therapy were without avail, and the patient died eleven weeks after his dismissal from the clinic.

PATHOLOGIC DATA

The results at necropsy, reported through the courtesy of Dr. Paul Bertrand Champlin of Find, Okla., revealed definite endocarditis of the mitral valve as well as a small warty lesion on the aortic valve (fig 3). The only other observation of significance was one infarct in the spleen. The other abdominal viscera were essentially normal. The observations were again suggestive that the fatal termination of the patient's illness was accompanied by subacute bacterial endocarditis with the usual associated findings.

Special studies of the pathologic tissue were made by one of the sections on pathology. Extensive, organized vegetation on the mitral valve of the heart covered approximately a fifth of the surface of the valve. The vegetation extended on the chordae tendinae, and inextensive vegetation was seen on the free edge of one of the aortic cusps. Histologically there was definite evidence of old rheumatic fever both in the myocardium and at the base of the valves. Enmeshed in the vegetations were myriads of a yeastlike organism having the typical appearance of *Histoplasma capsulatum* (fig 4). Examination of the spleen revealed an old healed infarct. An occasional *Histoplasma capsulatum* was demonstrable in the reticuloendothelial cells of this organ. Examination of the kidneys disclosed a moderate amount of arteriolar sclerosis, with an occasional zone of a granulomatous nature in the cortex. These zones were composed of inflammatory cells and foreign body giant cells. Although *Histoplasma capsulatum* could not be demonstrated after special staining, these zones nevertheless were suggestively involved by the organism. Study of a portion of the liver obtained at necropsy revealed nothing but chronic passive congestion. In the specimens of tissue of the liver previously taken for biopsy, however, *Histoplasma capsulatum* could be demonstrated in the granulomatous zones.

COMMENT

From a clinical point of view this case represents primarily another example of the problem of recurrent hyperpyrexia of obscure origin. The patient had never suffered from rheumatic fever, although he had had scarlet fever in his youth as well as "growing pains" as a child. The clinical course, together with the physical findings, was highly suggestive of subacute bacterial endocarditis. Repeated blood cultures were negative, a fact which resulted in our attempt to establish the definite diagnosis by simple abdominal exploration. The finding of *Histoplasma capsulatum* by means of biopsy of tissue obtained from the liver was extremely valuable. There is little doubt that the patient was suffering from what appears to have been one of the few instances of systemic infection due to histoplasmosis. What part the preceding peritonitis played in the onset of the patient's illness cannot be definitely stated. It seems reasonable to assume, however, that this may have been the initial lesion. The subsequent course, as well as the pathologic data, which included an old rheumatic heart lesion and

also the unusual finding of this organism in the vegetative process in the heart, renders this case a rather unusual clinical and pathologic entity. It appears to be the first case of its kind noted in the literature. As knowledge of the organism of infection increases, opportunity to observe similar instances of the disease may be afforded.

SUMMARY

In a case presenting the clinical syndrome characteristic of vegetative endocarditis in which the causative organism was *Histoplasma capsulatum*, the clinical course, laboratory and physical findings were identical to those which accompany subacute bacterial endocarditis. The illness terminated fatally, in spite of attempts at therapy. This appears to be the first case of its kind recorded in the literature.

THE SELECTIVE ACTION OF THIOBISMOL ON INDUCED MALARIA

MARTIN D. YOUNG, ScD

SOL B. McLENDON, MD

AND

ROY G. SMARR, MD

COLUMBIA, S. C.

One of the problems of the malarial therapy of neurosyphilis has been the need of a drug to reduce the frequency of the paroxysms without eliminating them altogether. Until recently no drug, including the common antimalarials, has demonstrated a reliable selective effect, the administration of the drug causing either no change or a total suppression of the paroxysms. In 1939 Schwartz¹ found that thioibismol (sodium bismuth thioglycollate) would convert *Plasmodium vivax* paroxysms from a quotidian (daily) periodicity to a tertian (alternate days) periodicity. Subsequently other workers² confirmed this observation. However, the age (measured in the number of hours from the last fever peak) at which parasites are affected and therefore the best time to administer the drug have not been definitely established.

The present investigation was undertaken with a two-fold purpose: (1) to determine at what age the parasites are affected by thioibismol and consequently the optimum time of administration and (2) to find whether species of malaria other than *P. vivax* can be controlled similarly.

PROCEDURE

The drug was tested on the strains of malaria which are employed at the South Carolina State Hospital for the treatment of neurosyphilis. Our method of inducing and handling this malaria has been described elsewhere.³

The drug was administered intramuscularly in amounts of from 0.05 to 0.2 Gm. Frequency of administration and amounts of drug given are discussed later. The observations reported herein cover a two year period.

OBSERVATIONS

Plasmodium Vivax — As with other strains of vivax malaria, our strain (St Elizabeths) often shows multiple broods of parasites, producing quotidian paroxysms. To prevent the patient from weakening unduly, it is desirable to have the paroxysms occur every other day. Therefore thioabismol was tried.

A total of 13 white patients were given one or more doses of thioabismol. The results are presented in the accompanying table.

One patient (J L H) with two broods of parasites was given 0.05 Gm of thioabismol. This dosage had no effect on the paroxysms, and the dosages thereafter were increased.

The table shows that an injection of 0.1 or 0.2 Gm of thioabismol given sixteen to twenty-eight hours after a fever peak (column 3) prevented recurrences of the paroxysms caused by that brood of parasites. When the drug was given at the other hours indicated (column 4) either the paroxysms were not affected or the effect was desultory.

The chart (temperature chart of patient W V) shows a typical reaction. The 17 hour old group ceased to produce paroxysms, the 41 hour old group continued to produce them.

In 2 instances, more than one injection of the drug was given at forty-eight hour intervals: patient J L H received two injections and patient D J B received three. However, no advantage was obtained from multiple injections that was not realized from a single injection.

To determine whether the number of broods of parasites influenced the action of the drug, patients with

However, when there was only one brood of parasites and the drug was given when they were about half grown, future paroxysms were prevented. In patients with multiple broods (H B and L H in the table), only the brood about half grown was affected. The foregoing results indicated that the number of broods

Temperature chart of patient W V showing the conversion of paroxysms from a quotidian to a tertian periodicity by one injection of 0.1 Gm of thioabismol (indicated by arrow). The drug was given seventeen hours after the last paroxysm caused by parasite brood A and forty-one hours after the paroxysm by parasite brood B. The A paroxysms were eliminated and the B paroxysms continued.

present did not influence the action of the drug but that the main factor was the age of the parasites.

The parasitologic picture coincided with the clinical picture. When the drug was given at the peak of the paroxysm in a single brood infection (tertian) the parasite density was not materially changed (patient T B S). However, when two broods were present the parasites that were half grown decreased in number and, although the other brood was not affected, the total parasite count dropped considerably. When only one brood of parasites was present and thioabismol was given when these were half grown, the parasite density dropped sharply and, although a few parasites might still be found in the blood stream, the paroxysms usually ceased.

By examining the blood smears at four hour intervals one could see the effects of the thioabismol on the half grown parasites. Within four hours after administration shrunken, fragmentary and irregular staining parasites were found, as well as parasites free from the erythrocytes. Correlating the parasites according to size and age groups revealed that the half grown parasites diminished in number sharply in the twelve hours following drug administration. This observation correlates with the foregoing parasitologic and clinical findings. However, it must be pointed out that although thioabismol seemed to act to some extent directly on the parasite, as demonstrated by the degenerative changes just mentioned, the degree of this action does not seem to be extensive enough to account for all the decrease in the brood affected. There appears to be some other influence as well and the clarification of the exact action of thioabismol against the parasites needs further investigation.

Plasmodium Malariae — Because of several favorable characteristics quartan malaria is being widely used in the treatment of neurosyphilis. Occasionally, but much less frequently than with *P. vivax*, multiple broods of parasites appear, causing paroxysms oftener than every seventy-two hours. Since such a condition is usually undesirable thioabismol was tried on this strain (United States Public Health Service) or *P. malariae* to see whether some of the broods or parasites could be eliminated.

Effect of Thioabismol on the Different Age Groups of *Plasmodium Vivax* Parasites

* Age is given as the number of hours from last fever peak caused by that brood of parasites to the time of drug administration.

† Drug given at forty-eight hour intervals.

‡ Results desultory. Usually were given several days rest then paroxysms returned as formerly.

both single and double broods were tested. Patient T B S with only one brood of parasites producing paroxysms every other day (tertian) received one injection of 0.2 Gm at the height of a paroxysm. The paroxysm recurred every other day thereafter, as would have been expected if no drug had been given, showing that the drug had no effect. About two weeks later another 0.2 Gm injection was given the patient at the height of a fever with the same results as before.

Thiobismol in 0.1 and 0.2 Gm amounts was given thirty-seven times to 9 Negroes showing either one, two or three broods of parasites. Fifty-three broods of parasites in thirty-three age groups ranging from two to seventy-two hours after the fever peak were involved, so that practically every age group was covered.

No consistent results were obtained. Usually the parasite density decreased for several days. Sometimes several paroxysms would be skipped, but this was not always true. In short, definite action against various age groups of *P. malariae* could not be demonstrated.

Plasmodium falciparum.—Occasionally a neurosyphilitic patient is immune to both *P. vivax* and *P. malariae*. In such cases *P. falciparum* can be used, but the patient must be watched most carefully because of its malignant character. Therefore we tested thiobismol on *P. falciparum* to see whether it could be rendered more manageable. The *P. falciparum* used was obtained Oct. 16, 1940 from a young Negro male who was admitted to the hospital suffering from malaria and is hereby designated as the McIndoon strain. Since the isolation of the McIndoon strain of *P. falciparum* it has been used continuously for the treatment of neurosyphilis.

Nine Negro patients received thirteen injections of the drug, ten of these injections were of 0.2 Gm and three were of 0.1 Gm.

No remission of the paroxysms could be demonstrated. The parasite density apparently was not altered by the drug. Of the three species, *P. falciparum* showed the least response to the drug.

COMMENT

Thiobismol in 0.1 and 0.2 Gm amounts exhibited a definite inhibitory effect on half-grown *P. vivax* parasites i. e. about sixteen to twenty-eight hours after a paroxysm caused by that group of parasites. (As the peak of the fever follows the peak of the parasite segmentation by several hours, the actual age of the parasites was several hours greater than the elapsed time from the fever peak.)

The thiobismol did not exert much effect on parasites either younger or older than the sixteen to twenty-eight hour limits. When two broods of parasites were present producing quotidian paroxysms, an injection of thiobismol eliminated the brood about half grown, leaving the other brood to continue producing paroxysms every other day. This tertian periodicity of paroxysms usually persisted throughout the remainder of the infection and in some cases through several subsequent transfers.

If it is possible, therefore, to change quotidian paroxysms of *P. vivax* to tertian by giving 0.1 or 0.2 Gm of thiobismol, preferably the former amount, about twenty-four hours before or after the paroxysms to be eliminated. A convenient time to administer the drug is at the fever peak. The quotidian occurrence of paroxysms often taxes the patient so severely that it is impossible for him to undergo a full course of twenty paroxysms. Changing the paroxysms to a tertian occurrence better enables the patient to withstand a full course of malaria. The selective property of thiobismol is of much value in the control of malaria and is a characteristic that so far has not been demonstrated by the commonly used antimalarials such as quinine.

In our work on *P. malariae*, a selective effect of thiobismol on different age broods of the parasites has

not been demonstrated. Usually there was a decrease in parasite numbers following administration.

Against *P. falciparum*, thiobismol seems to have almost no inhibitory effect.

We are not able at present to offer any satisfactory explanation for this difference in the action of thiobismol on the three species of malaria.

Quite often quinine will not prevent the occurrence of paroxysms for several days after it has been started. It has been found useful here in terminating a *vivax* infection to give an injection of thiobismol the day on which quinine is started. The thiobismol will usually prevent the occurrence of a paroxysm the following day. After that the quinine controls the infection.

This combination of thiobismol and quinine might be found useful in malaria infections generally.

SUMMARY AND CONCLUSIONS

1. Thiobismol in 0.1 or 0.2 Gm amounts was found to have an inhibitory effect against *P. vivax* parasites which were half grown, i. e., about sixteen to twenty-eight hours after the last paroxysm caused by that brood of parasites. Parasites older or younger were not affected.

2. On examination of the blood, thiobismol seemed to injure the half grown parasites and to reduce their numbers (density). No such effect was seen when parasites were older or younger.

3. By giving the drug during the sixteen to twenty-eight hour period after a paroxysm, that series of paroxysms was eliminated. Thus paroxysms were converted from quotidian to tertian periodicity.

4. Paroxysms converted to tertian periodicity usually remained so during the remainder of the infection and sometimes through several subinoculations.

5. The occurrence of paroxysms every other day (tertian) instead of daily (quotidian) enables a neurosyphilitic patient better to undergo a full course of malaria therapy.

6. In *P. malariae* infections, a definite action of thiobismol against any particular age group of the parasites could not be demonstrated. The administration of the drug sometimes gave temporary rest and a transitory diminution of parasites.

7. Practically no effect of thiobismol could be demonstrated against *P. falciparum* infections. Neither the course of the paroxysms nor the parasite density was considerably altered by the administration of the drug.

8. For the termination of *P. vivax* infections it has been found that one injection of thiobismol given the day quinine is started usually acts quicker than quinine alone by preventing a paroxysm the following day. It is suggested that this combination might find a wider use generally.

The Need for Oxygen During a High Parachute Jump

—The time of survival without oxygen has been estimated for various altitudes. At 40,000 feet a man would have one minute before he became unconscious, at 35,000 feet he would have three minutes, while at 20,000 feet he may last fifteen minutes. These facts illustrate the need for oxygen during a parachute jump from high altitudes. If a man should jump out of his plane at 40,000 feet and pull the rip cord, he would descend at the rate of 1,500 feet per minute. It would take him ten minutes to reach 25,000 feet and he would be dead from anoxia as a result.—Gemmell, Chalmers, L. *Physiology in Aviation*. Springfield, Ill., Charles C Thomas, Publisher, 1943.

SULFADIAZINE IN RESPIRATORY
TRACT INFECTIONSITS VALUE IN TREATMENT DURING WINTER OF
1942-1943 AT JEFFERSON BARRACKS MISSOURI

LIEUTENANT COLONEL HOWARD A RUSK

AND

CAPTAIN ARIC C VAN RAVENSWAAY

MEDICAL CORPS ARMY OF THE UNITED STATES

While it seems well established, both on a clinical basis and from the present concept of the mode of action of the sulfonamide drugs, that these drugs have no effect on virus infections, they are nevertheless being widely used in the treatment of such conditions as the common cold, influenza and atypical pneumonia symptom complexes which are difficult to evaluate clinically from a causative standpoint because of lack of simple laboratory diagnostic procedures but which in most instances are considered to be caused by virus infections.

Such use of the sulfonamide drugs is based on several premises: the prevention of secondary bacterial infections, the danger of withholding treatment in cases of pneumonitis caused by unrecognized sulfonamide sensitive bacterial infections and possibly chiefly because the American physician has become extremely sulfonamide conscious and, as newer and less toxic forms have been devised, has become less hesitant in the use of these substances. In obscure cases, perhaps he relies on them with the same feeling that his grandfather had toward quinine.

Because of the large number of respiratory tract infections which are seen in a large army station hospital under conditions which make possible a more carefully controlled clinical study than is possible in civilian life, three comparable and controlled series of patients with respiratory tract infections with fever and malaise sufficient to warrant hospitalization were studied during the winter of 1942-1943. The accompanying table illustrates the results obtained.

In each of the three series, the patients admitted to one or more wards were treated with sulfadiazine at an initial dose of 3 Gm and subsequent doses of 1 Gm every four hours being given and the latter being continued until convalescence was established or until non-improvement in protracted cases indicated that it should be stopped. The average total dose given was 25 Gm. Those admitted to other and similar wards were given A P C capsules¹ every four hours. In addition, both groups of patients were given the usual supplementary therapy consisting of adequate fluids by mouth, gargles, intranasal medication, cough mixtures and steam inhalations as indicated. Patients with typical follicular tonsillitis were excluded and transferred to other wards. Chest plates were taken of all patients on the third day of hospitalization and at other times as conditions suggested. All patients developing x-ray evidence of pneumonia were excluded from the series.

There was no appreciable difference in the number of cases of pneumonia appearing in the wards in which sulfadiazine was given as compared with the control

wards. The percentage in the former was 14 and in the latter 16. It should be emphasized that probably the majority of cases of pneumonia were in the incubation period at the time of admission and that this is not considered a test of prophylaxis. Patients with obvious pneumonia were sent directly to special pneumonia wards on admission, and while etiologic studies were rendered difficult in the group receiving sulfadiazine, it seems probable on the basis of x-ray and laboratory evidence and sputum studies in the control group, that the bulk of these cases of pneumonia were of the atypical variety.

The patients included in the study, after those in whom pneumonia developed are eliminated, were kept hospitalized for a minimum postfebrile period of seventy-two hours, or longer if troublesome symptoms persisted. Routine urinalysis and complete blood counts were done on all patients. In the series of cases studied there were no reactions from sulfadiazine therapy aside from a few instances of slight nausea.

Comparable Results Obtained in Treatments of
Respiratory Tract Infections

Series	Ward	Treatment	Num- ber of Cases	Percent age Devel- op- ing Pneu- monia	Aver- age Days of Fever	Aver- age Days in Hos- pital	Percentage of Cases in Which Fever Persisted After 48 Hrs
1	11/17/42	Sulfadiazine	46	15	3.2	7.0	
to	12/1/42	A P C	60	9	4.1	8.8	
2	12/7/42	Sulfadiazine	50	9	2.4	6.5	
to	12/30/42	A P C	72	13	2.4	6.7	
3	12/17/42	Sulfadiazine	165	16	2.7	6.9	33

to	12/6/42						
Summary for sulfadiazine group			317	15	2.7	7.2	
Summary for A P C group			314	14	3.1	7.4	

A study of the table will reveal indications of variation in virulence of the infectious process when series of cases studied at different times during the winter are compared. Sixty patients in November 1942 receiving A P C capsules had an average hospital febrile period of 4.1 days while 72 similarly treated patients in December 1942 had a comparable febrile period of 2.4 days. Comparison of the groups receiving sulfadiazine with the control groups revealed no significant difference in favor of the former.

A third small group of patients were given 5 gram tablets of Dover's powder (powder of ipecac and opium), 1 tablet every four hours. The clinical results were so poor and obstipation so troublesome that this treatment was soon discontinued. The results in this small group are also indicated in the table.

Since no deaths occurred in the series either directly or from complications and since there was no appreciable difference in the complications which did appear in the two groups (atypical pneumonia) the cost factor may properly be considered. Assuming a purely arbitrary number of 100 new hospital cases of respiratory

¹ A P C capsules contain a grain 315 grains (acetosalicylic acid 0.2 Gm), phenacetin 24 grains (acetophenetidin 0.16 Gm) and citrated caffeine 1/2 grain (0.032 Gm).

tract infections daily, treatment with sulfadiazine on the basis of 75 cents for 25 gm would cost \$2,250 a month, while A P C capsules, on a basis of 4 cents for 20 capsules would give a comparable figure of \$120 a month. The differential in civilian life would obviously be much greater.

CONCLUSION

In a clinically controlled series of 670 cases of simple respiratory tract infections there was no significant difference, either in the length of the febrile period or in the period of hospitalization, among the group receiving sulfadiazine as compared with the control group receiving symptomatic treatment.

Clinical Notes, Suggestions and New Instruments

BROMIDISM AFTER EXCESSIVE DOSAGE OF PROSTIGMINE BROMIDE FOR MYASTHENIA GRAVIS

J. M. NIELSEN, M.D., LOS ANGELES

The quantity of bromide which can safely be ingested by different persons varies enormously. The variability seems to depend not only on the differences with which various persons retain bromide but on the different concentrations of bromide which cause clinical symptoms of bromidism in different persons. For two reasons therefore, it is necessary for the clinician to guard against bromide intoxication even in instances in which the bromine forms a relatively small portion of the bromide molecule prescribed.

Since the advent of prostigmine bromide as a means of administering prostigmine orally in the treatment of myasthenia gravis, patients with this disease have had a means of steadier relief from symptoms in addition to obviating the necessity for numerous hypodermic injections of prostigmine methylsulfate. The case here reported however, shows a possible danger through bromidism in the self administration of prostigmine bromide—a danger which one would hardly anticipate and one of which I have been unable to find any previous record.

Recently a patient was received for treatment of myasthenia gravis after she had herself increased her dosage of prostigmine bromide to a point generally considered dangerous, but the danger arose from the bromide portion of the molecule instead of from the prostigmine portion. She had taken 30 mg every three hours day and night for months. To her symptoms of myasthenia gravis were added those of bromide intoxication—mental confusion and paranoid symptoms—as well as the physical sign of thickness of speech. As the last named symptom is common to bromidism and myasthenia gravis, the remedy prostigmine bromide may greatly add to the symptoms of the disease being treated.

REPORT OF CASE

Myasthenia gravis, successful treatment with prostigmine bromide, excessive dosage self administered, bromidism, death

Mrs W J O, a white woman aged 32 with an irrelevant history of past illnesses, considered herself well up to March 1941, at which time she had an acute illness diagnosed as streptococcic sore throat. The organism was said to have been isolated and the patient was treated with sulfanilamide. After an apparent immediate recovery she had a relapse in a week or ten days. A second course of treatment with the same drug brought about a complete recovery.

She remained well until September, when she began to have episodes of "talking through her nose." This symptom was considered a sort of complication of her previous trouble.

At Christmas an illness diagnosed as influenza developed, and since that time, she said, she had never been well. In

another month, by January 1942, her arms were so weak that she had difficulty in washing her hair. By March she had difficulty in chewing, swallowing and talking after midafternoon, though she had no trouble early in the day. It was more difficult for her to swallow solid food than liquids, she seemed to lack strength to force food through the esophagus.

In July diplopia developed, first noticed while she was driving her car. By that time she had to confine all her activities to the forenoon. Then, just as she was becoming incapacitated, she had a remission with disappearance of all her symptoms.

After a remission of several weeks her symptoms suddenly returned and she consulted a neurologist who, as part of the examination, gave her an injection of prostigmine methylsulfate, which removed all her symptoms in fifteen minutes. However, her joy was short lived, because he told her that what he had done was only by way of a test and that inevitably she would die of her disease within a year. He prescribed prostigmine bromide to be taken by mouth, and she got along quite well for a few months.

When I saw her she presented typical myasthenia gravis. She was too weak to reach over her head and she could not depend sufficiently on her grip to hold dishes, of which she had broken many. She had an almost constant ptosis and anisocoria and she fatigued very rapidly in general on exertion. The reflexes diminished in less than one minute on repeated testing. The thyroid was not palpable and x-ray examination showed no evidence of enlarged thymus. The heart and lungs were normal. The blood pressure was 118 systolic and 90 diastolic. The pulse rate was 72 a minute. There were no pathologic reflexes anywhere.

To remove the emotional depression due to a hopeless prognosis, I assured her (with her husband's collaboration and understanding) that her illness was no longer serious because of new facts recently discovered. With her new hope she returned home, taking 90 mg of prostigmine bromide daily, and she did remarkably well for a few months.

I saw nothing more of the patient, who lived in another city, until Feb 11, 1943, when she was admitted to a sanatorium in Los Angeles because of mental confusion. Examination there showed decided thickness of speech and other signs of myasthenia gravis but also disorientation and unwillingness to accept any advice. She demanded her discharge, was suspicious of the food served and was unapproachable by any argument. She evidently had a paranoid psychosis.

Because of the altered clinical picture and because the patient had brought a large supply of prostigmine bromide, the husband was asked as to dosage of the drug. He stated that the patient had gradually increased the dosage in desperation for relief until she was taking 240 mg daily. He had bought all she had asked for because he considered the situation hopeless anyway. When questioned about other drugs, he denied that he had given her anything except an occasional tablet of phenobarbital when she was fearful or anxious. For that purpose he had obtained a prescription from a local physician. No one had prescribed bromide or any other medication except as stated.

A blood bromide determination was ordered on that day. During the night the patient died in her sleep. On the following day the laboratory report was obtained, showing a concentration of bromide in the blood amounting to 225 mg per hundred cubic centimeters.

COMMENT

No other instance of bromide intoxication has been found reported in the literature from prostigmine bromide. Of the 240 mg of prostigmine bromide taken daily only a relatively small portion would be bromine, and even if the entire quantity was calculated as "bromide" the dosage would be smaller than that which is ordinarily considered dangerous, yet this small amount accumulated in the patient's blood to cause bromidism.

Doctors using prostigmine bromide in cases of myasthenia gravis should be warned to guard against bromidism. The danger can be avoided by stringent supervision or by an occasional change to prostigmine methylsulfate.

HANDBOOK OF NUTRITION· XXVI

PRINCIPLES OF DIET IN THE
TREATMENT OF DISEASETOM D SPIES, M.D.
CINCINNATI

These special articles on food and nutrition have been prepared under the auspices of the Council on Foods and Nutrition. The opinions expressed are those of the authors and do not necessarily reflect the opinion of the Council. These articles will be published later as a Handbook of Nutrition.—Ed

Although the importance of diet in the treatment of disease was emphasized by Greek and Roman physicians, a true conception of the value of food as a therapeutic agent has been gained only in recent years. The many ramifications of our knowledge concerning food could not be listed, let alone described adequately, within the scope of this paper. The administration of indicated foodstuffs or their specific constituents to persons with specific deficiency diseases is followed by

act very efficiently at first and against lesser odds when the detrimental factors are not too protracted. Excessive physical exercise, acute infections and fever affect adversely those factors which tend to maintain nutritional balance. In the beginning of many deficiency diseases, levels of the essential substances in some tissues are decreased at the expense of others. In other words, there is a protective homeostatic control of the storage and distribution of many of these substances vital to the cells. Equilibration becomes more and more difficult to achieve as time goes on. One could say, perhaps arbitrarily, that the dietary deficiency development is under way and that at least a biochemical lesion is present. When this lesion is severe enough, functional disturbances arising from various parts of the body become manifest. Vasomotor instability in the skin, functional disorders of the alimentary tract, nervous system or circulatory system may occur. There is no regular order to the appearance of these symptoms, and presumably they are affected by hereditary predisposition or trauma in the wear and tear of everyday life. Certain it is that the clinical picture is complex and is composed of an infinite variety of symptoms. After many months of severe or persistent symptoms, accompanied perhaps by slight chemical and physiologic

miraculous improvement. The judicious use of these specific substances as therapeutic agents is revolutionizing the practice of medicine. Even more benefits to mankind would follow the application of this knowledge toward the prevention of these nutritional diseases. Certain it is that proper nutrition is essential for the health and vigor of the higher forms of life and every living cell in the human body requires specific nutrients. Though the cell must have these nutrients, some of them it cannot always make. Accordingly, they must be supplied if the body is to function normally.

Respiration and growth of cells involve the synthesis of complex substances from simple ones. When the available simple compounds are inadequate to supply the needs of the body, as the result of inadequate assimilation, increased demand, increased loss or a decreased supply, a disorder is initiated and factors which operate to maintain nutritional balance are brought into play. These beneficial mechanisms may

alterations, structural changes begin to appear in the various tissues, and ultimately the clinical diagnosis can be made.

The practicing physician who at last is called on to treat a case of clinical deficiency disease is faced with a nutritive breakdown. Yet he has little information of the previous nutritional status of the patient, a factor of great importance in restoring and maintaining his health. Since 1936 my associates and I have been faced with the same problem and, like the practicing physician, we realized the necessity of initiating immediate therapy. At the same time however we have been especially interested in devising methods of persistent therapy of a type which would eliminate such dicta as "once a pellagrin always a pellagrin." Accordingly, in treating each patient we began the long and arduous task of determining the factors responsible for his nutritive breakdown for it is only by their elimination that one can avoid recurrences. This paper is concerned

with the principles of practical therapy which have been derived from the application of the methods outlined to thousands of our cases during the past several years. While other investigators have made similar studies, we are somewhat more familiar with what we have done. Accordingly, we are reporting our methods in some

TABLE 2—Case Illustrating Unsatisfactory Diet

Food	Amount Recommended for an Adequate Diet *	Amount Taken by Patient
Milk	2 cups daily	1 cup daily
Eggs	1 weekly	2 weekly
Meats		
Lean beef, liver, lamb, veal, chicken or pork, chick, or fish	16 small servings weekly	1 medium size serving of fish once a month
Salt pork		1 serving daily (about 1 ounce)
Vegetables and Fruits		
Tomato or cucumber or snap fruit	5 servings weekly	1 None
Potato or sweet potato	1 1/2 servings daily	1 1/2 servings weekly
Dried vegetables or nuts	1 1/2 servings weekly	1 serving daily
Leafy green and yellow vegetables	6 servings weekly	1 1/2 servings weekly
Other vegetable and fruits	6 servings weekly	1 1/2 servings daily
Bread, enriched or whole grain	At every meal	1 Liberal amount, but none of it enriched or whole grain
Cereal, whole grain	At least 1 serving daily	1 1/2 servings daily but not whole grain
Desserts	1 serving daily	1 None
Sugar and syrup	As desired	1 Moderate amount
Butter or fortified oil or margarine	2 table spoons daily	1 Liberal amount of pork fat

† Indicates foods of which patient did not eat sufficient amounts.

detail with the assurance that they would have the general support of other investigators in the field.

The essence of successful treatment is early and accurate diagnosis. The diagnosis of clinical conditions and the assessment of the nutritional status of a patient and his family can best be made by a conservative interpretation of the data from a dietary and food survey, a complete medical history and physical examination, and special laboratory determinations. The brief outlines which follow serve in our hands to gather partial information of the type needed. As in any other field of medicine, we attempt to gather information about the person as well as his disease, accordingly, it is impossible to give an outline which would suffice in all details for every person.

DIETARY ASSESSMENT

It is of primary importance to obtain a nutrition history when the patient is first seen. If the diet is found inadequate, tentative nutritional deficiencies are suspected, even though there is no diagnostic clinical manifestation at the time. In such instances, repeated dietary evaluation, laboratory studies and general clinical check-ups are made. If the diet seems adequate to meet normal nutritional requirements and the patient has lesions of nutritional failure, we begin our search for some condition which is increasing the nutritive requirements or interfering with the absorption or utilization of nutrients. For several years we have used the type of nutrition history shown in table 1 and have found it satisfactory for the initial studies of a person suspected of nutritional imbalance. Since we have placed ourselves in the position of the practicing physician, we believe this type of history will be a valuable aid to him in collecting data for a precise diagnosis and treatment.

This can best be illustrated by the case shown in table 2. By comparing the food eaten by the patient whose nutrition history is shown here with the food she needs, it is apparent that her diet falls far short of being satisfactory. Although this type of nutrition study does not allow an accurate calculation of the various nutrients in the dietary, it has the advantage of not requiring a great deal of time or special training on the part of the persons taking or evaluating the data.

We have found it desirable to make a thorough inventory of the income and food resources of the patient and his family, though it is time consuming, for not infrequently this material gives us a lead in determining the adequacy of his diet. If the income is low and food resources are meager, it is almost certain that the diet has been inadequate and it is desirable to study the nutritional status of the patient very carefully. We wish to point out, however, that it is fallacious to consider that an adequate or even a liberal income means that the diet has been adequate. Many persons who have liberal funds available for food fail to eat a proper diet. Others whose income is on first glance seemingly too low to provide a good diet, by careful budgeting and a wise selection of food, manage to get what they

need to meet their nutritive requirements. But there is a point below which the income and food resources cannot fall and still provide an adequate diet. For example, we found that the minimum cost of the food needed to satisfy National Research Council standards for a family of five, living in this geographic location, to be \$8.60 a week, whereas a particular family we had studied had a food allowance of \$2.50. No other

sources of food, such as a garden, chickens or livestock, were available to them

Frequently trained observers keep an accurate record of the patient's food intake for a period of a week or more at various seasons of the year. From this the nutritive value of the dietary is evaluated and the degree

except by clinical methods. It is customary in our studies to regard each person individually and to vary somewhat the general history, physical examination and special examinations, depending on the nature of the symptoms he presents. In all instances, information which satisfies the complete history and examination forms as listed in figure 3 is obtained. In addition, special organ systems are studied as indicated. Detailed examination of the mouth is particularly stressed.

When we have satisfied ourselves that the infants and children under our observation receive considerably less than the recommended allowance of essential nutrients, we are willing to accept the following symptoms as suggestive though not diagnostic of deficiency states: loss of desire for food and failure to gain weight, poor muscle tone, and aversion to play, abnormal tardiness in sitting, standing and walking, and pain on sitting or standing, insomnia, poor record in school, repeated respiratory infections, chronic diarrhea, photophobia, lacrimation, abnormal dryness and burning of the eyes, pallor, rough skin, fissures and maceration at the angles of the mouth, abnormally red tongue, increased pulse rate, beading of the ribs, enlarged wrists, square head, serious dental abnormalities, and Vincent's infection.

Likewise, in adolescents and adults, the following symptoms occurring in persons known to have ingested inadequate amounts of required nutrients suggest deficiency states: weakness, lassitude, lack of desire for

of deficiency of his diet is correlated with clinical findings and laboratory tests. Although such a study gives interesting results and has been of some value to us in determining the degree of deficiency of the various nutrients in the dietaries of many of our patients, it is too arduous and time consuming to be used as a routine procedure by the practicing physician. It requires the expenditure of a great deal of time both with the patient and in the calculation of the results. Such a method is practical only if the patient is sufficiently intelligent and cooperative to keep an accurate record of his food intake and if the time and services of a trained nutritionist are available to supervise the collection and summarization of the data and to calculate the nutritive value of the dietaries.

No human being is able to give a dietary history as comprehensive as the physician might wish, and if one was to rely solely on dietary assessment he would fall far short of the goal of accurate diagnosis which is the first requirement for satisfactory therapy.

SYMPTOMS AND PHYSICAL SIGNS

Of necessity the physician must place the greatest reliance on a complete history and physical examination (figs 1 and 2), as a diagnosis cannot be made

food, loss of weight, failure of mental application, sore mouth or tongue, constipation or diarrhea, nervousness and irritability, paresthesia, night blindness, photophobia, burning and itching of the eyes, lacrimation, general pains in the muscles or joints, Vincent's infection, cheliosis, red, swollen lingual papillae, glossitis, stomatitis, vaginitis, poor muscle tone, loss of vibratory sensation, alteration of tendon reflexes,

hyperesthesia of the skin, bleeding gums, dermatitis, abnormal pigmentation of the skin, particularly over the points of pressure, rachitic chest deformity, anemia, abnormal dryness or conjunctival injection of the eyes, vascularization of the cornea, inability to accommodate properly.

It has been customary to present through textbooks and lectures the manifestations of severe degrees of deficiency diseases. Hence it is little wonder that the milder forms have gone unrecognized and the real incidence is not always fully appreciated. Yet it is highly desirable that the physician make an early and accurate diagnosis in order to initiate therapy which will restore the patient's health before serious structural damage occurs in the tissues. For the most part the arrangement of the descriptive material in the previous chapters has been grouped around one nutrient or one disease arising from a deficiency of a single nutrient. This description certainly is justifiable, but it assumes a degree of simplicity which does not occur in the physician's day to day practice of medicine.

SPECIAL LABORATORY TESTS OF USE IN DIAGNOSIS

After we have analyzed the dietary record, medical history and physical examination and find symptoms in persons whom we suspect of having nutritional deficiency disease, we attempt to gain special information by means of laboratory tests. While they are not all practical for practicing physicians, facilities for some might be available to some physicians.

1 Hemoglobin determinations, red blood cell counts, and packed cell volumes are very important routine measures.

2 X-ray examination of the long bones should be made to detect active and healing rickets, and serum phosphatase and phosphorus determinations to detect early rickets. Serum calcium determinations are also useful.

3 Protein serum albumin determinations by the Kjeldahl technique are especially useful when protein deficiency is suspected.

4 Ascorbic acid determinations on plasma are useful in determining vitamin C substitution. Determination of the level in white cells often is made when vitamin C deficiency is advanced.

5 Slit lamp and biomicroscopic examinations of the capillaries in the conjunctiva and cornea are extremely valuable aids.

6 The detection of prothrombin deficiency is applied when vitamin K deficiency is suspected in persons with liver disease, particularly jaundice, or in expectant mothers.

7 The B. E. S. test, the recent colorimetric method described by Beckh, Ellinger and Spies, is of considerable clinical use in detecting small quantities of abnormal pigments in the urine of persons with "sub-clinical" and clinical deficiency states.

8 We frequently do determinations for vitamin A, thiamine, nicotinic acid, riboflavin, pantothenic acid, biotin and pyridoxine. In some instances these laboratory findings can be correlated with the clinical findings, in others, they cannot.

9 Myriads of Vincent's organisms, staphylococci and streptococci can be identified in smears taken from mucous membrane lesions in the mouth or in the vagina. The staphylococci and streptococci often can be isolated

in pure culture from the lesions of riboflavin deficiency. The organisms in these lesions disappear rapidly after specific therapy is given to the patient.

10 Gastric analyses are made before and after histamine injections—we determine free hydrochloric acid, pepsinogen and rennin, and in special cases determine the presence or absence of the intrinsic factor of Castle.

SPECIFIC PRINCIPLES OF THERAPY AND SUGGESTED METHODS OF APPLICATION

The more we have studied diseases arising from nutritional imbalance, the more we have become impressed with the great factor of safety operating to protect the body. Life continues long after deficiency states set in, and there is always a margin of safety between the beginning of ill health and death from nutritional failure. When functions of the tissues become diminished or altered as the result of a deficiency over long periods of time, there is usually quick restoration of function following adequate amounts of specific therapy. Nevertheless there is a limit to the self regulation, and indeed, at times, to the repair which is possible as a result of therapy. These vital substances frequently must come to the human body from an external source, and, since the body does not conserve all, it is important that a person with nutritional deficiency diseases have as little activity as possible while repairs to the affected tissue are under way. The specific agents, whether they are food, yeast, liver or extracts of these substances or synthetic vitamins, serve in a natural manner to perform a natural function. The recommendations which are to be made have arisen chiefly from the gratifying experience of having treated over 5,000 consecutive patients with dietary deficiency diseases without a death. Deficiency diseases are not rare. The apparent mystery surrounding them is due in great part to gaps in our present day knowledge. Nevertheless, the practicing physician should and must apply the best knowledge available to the diagnosis and treatment of nutritional deficiencies. To do so, our experience would lead us to suggest that his diagnosis will depend chiefly on a reliable interpretation of a carefully taken history and a thorough physical examination. When taking the history, the physician should have in mind that deficiencies of the essential nutrients are particularly prevalent in the following four groups.

1 Those who are indigent and have erroneous dietary habits or dietary idiosyncrasies. Many such persons live for a long period of time on a diet low in protein and calories, minerals and vitamins, and relatively high in carbohydrates and fats. These diets often contain far too little milk products, lean meat, fish, green vegetables and fruits.

2 Persons with organic disease. The incidence of deficiency diseases is especially high among persons with chronic tuberculosis, diseases of the alimentary tract and cardiovascular system and diabetes, which interfere with the ingestion, assimilation or utilization of the protective substances present in food. Many of these persons have an opportunity to eat sufficient amounts but because of their disease either have lost their desire to eat or are unable to utilize it properly.

3 Too frequently the overzealous physician in treating a certain type of organic disease prescribes a diet so deficient that nutritive failure is gradually induced. While we do not wish to give the impression that all therapeutic diets are necessarily inadequate diets, we

not infrequently find patients develop nutritional diseases as the result of restriction to diets prescribed for therapeutic purposes. Figure 4 illustrates some of the deficiencies occurring in diets consumed by persons with nutritional diseases who came to us for treatment. We suggest that the physician prescribing special therapeutic diets check the food recommended with that which he knows is required for the adequate diet. If the restrictions are of such nature that the foods permitted cannot provide the essential nutrients in adequate amounts, it is recommended that he supplement those nutrients as required by use of synthetics or concentrates.

4. Persons with chronic alcoholic addiction. Persons who substitute the calories in alcohol for the calories in food are prone to develop deficiency diseases. If, however, a liberal adequate diet is eaten, deficiency diseases are not likely to occur even when large amounts of alcohol are ingested.

It should be kept in mind that in all groups many undernourished people never develop a clinical sign diagnostic of a specific deficiency disease. Irrespective of whether the deficiency develops following poverty, dietary idiosyncrasies, organic diseases, alcoholic addiction, erroneous dietary habits or any combination, the

fat soluble group, occur together in fish liver oils and are customarily used together therapeutically. Vitamin K is usually classified as a fat soluble compound, though water soluble synthetic compounds having vitamin K activity are available. Vitamin K should be considered as a special substance essential for the maintenance of normal concentration of prothrombin in the blood. Except for the hemorrhagic disease of the newborn, a deficiency is usually the result of faulty absorption rather than inadequacy of vitamin K in the diet. Vitamin E is being extensively studied, but as yet its value in the treatment of diseases of human beings is a matter of conjecture. The vitamins of the B complex are water soluble and found especially in such natural products as yeast and liver. Viable yeast and liver cells function as an active laboratory in producing these substances. They appear to be intimately concerned with carbohydrate metabolism. Ascorbic acid is a member of the water soluble group and is specifically concerned in the prevention and treatment of scurvy.

Too often polyvitamin products have not been as useful as they might have been. It seems wise that the amount of vitamins in mixtures should bear a relationship to the normal daily requirements. The physician in turn may then prescribe amounts of these vitamins as

lesions, symptoms, seasonal incidence and methods of treatment are essentially the same.

Foods, dried brewers' yeast, liver concentrates and synthetic vitamins, and certain minerals, are as much a part of the present day physician's armamentarium as arsphenamine and insulin. To consider diet properly the physician should think in terms of enough dextrose, amino acids, fatty acids, minerals and vitamins. The foods in the alimentary tract are altered through successive steps of digestion and absorbed into the blood stream and passed into the tissues. The proteins are absorbed as amino acids, the carbohydrates as sugars, and the fats as fatty acids. The vitamins and minerals are altered little if any. The body can synthesize only about one half of the different amino acids which are required, and the other half must be provided. Amino acids may be turned into urea or their carbon fractions used to form dextrose, or they may 'sacrifice themselves' to protect us from poisonous products. Perhaps they can serve as source material to act with or aid in synthesizing certain compounds of physiologic function still to be identified. Some of these amino acids enter into the proteins of the tissue and, like the dextrose, the fatty acids, the minerals and the vitamins, become for a time parts of our living tissues.

Long ago we learned that the diagnosis of one clinical syndrome denoting nutritional failure necessitates a thorough search for others. While individual vitamins have special functions, they are wisely administered together. Vitamins A and D, which are members of the

multiples of the estimated daily requirement. Recently, the National Research Council has seen fit to make the recommendations presented in table 3.

Where synthetic vitamins, such as riboflavin, nicotinic acid or thiamine, are added to dried brewers' yeast or liver, it is desirable that a substantial amount of the vitamins come from the yeast or liver.

METHODS OF THERAPY

Therapy should be directed along four lines. 1. Conditions causing excessive requirements for nutritional essentials should be removed or relieved wherever possible. 2. Substances should be administered in sufficient amounts to correct the deficiency. 3. Symptomatic treatment and treatment for coexisting diseases should be given. 4. A liberal amount of a well balanced diet which has been discussed in other portions of this book, should be prescribed. It is often necessary to combine specific therapy, symptomatic therapy and the treatment of coexisting diseases in order to treat the patient successfully. The very essence of treatment for nutritional diseases lies in the administration of foods rich in proteins, minerals and vitamins, supplemented by specific therapeutic agents. The foods prescribed will depend on the nature of the deficiency and the age, race, habits, tastes and financial status of the patient concerned. The diet should be supplemented with appropriate preparations in terms of dried brewers' yeast or liver extract, or concentrates thereof, or of synthetics or minerals. More specifically, we find that, where clinical syndromes arise from a deficiency of

vitamins, a deficiency of many other essential nutrients is likely to exist. It is of prime importance in prescribing for every case to insure the ingestion and retention of a diet which meets the patient's nutritive requirements. This diet must be one that the patient can eat, digest and assimilate. It must be remembered, however, that to rely on dietary therapy is inadvisable and impractical. Deprivations of the nutrients usually have existed for years and often the deficiency is advanced so that the food the average person can eat is not sufficient to supply the amount of the food factors necessary to restore his health promptly.

Our clinical experience and controlled studies have led us to adopt a policy of mixed vitamin therapy in treating nutritional deficiencies. The amounts of therapeutic substances prescribed necessarily vary considerably from patient to patient and even in the same patient it varies at different times. It is better to prescribe too much than too little, too soon rather than

too late. Although there are many ways of treating nutritional deficiencies, we have found that the following therapy gives satisfactory results.

In treating the clinical syndromes of beriberi, pellagra, riboflavin deficiency and scurvy, we use a formula containing 10 mg. thiamine, 50 mg. niacin, 5 mg. riboflavin and 75 mg. ascorbic acid. If the symptoms of one deficiency predominate we add to the basic formula more of the vitamin specific for the predominating deficiency. In the case of beriberi, 10 mg. of thiamine is added daily, in riboflavin deficiency 5 mg. of riboflavin b₁ d daily, in scurvy 100 mg. of ascorbic acid t i d, and in mild pellagra 50 mg. of niacin amide t i d. If the pellagra is severe, the patient is given 150 mg. of niacin amide t i d in addition to the basic formula. When the patient is moribund from nutritive failure due to deficiencies of the vitamin B complex it may be necessary to resort to parenteral injections in order to prolong and indeed even to save life. When large amounts of d-glucose are injected daily, we recommend the inclusion of 20 mg. of niacin amide, 75 mg. of riboflavin and 5 mg. of thiamine. In a few instances we have found it desirable to inject 50 mg. of ascorbic acid in isotonic solution of sodium chloride.

Dried brewers' yeast powder, liver extract, wheat germ and rice polishings are excellent therapeutic agents for the treatment of diseases arising from a deficiency of the B complex vitamins. These substances are particularly valuable in that they contain significant amounts of protein and other essential nutrients, and probably vitamins of the B complex as yet unknown. The amount administered depends on the severity of the disease. We usually give daily from 4 to 6 ounces of dried brewers' yeast powder or oral liver extract, from three to four doses of 20 cc. of parenteral liver extract, or from 150 to 300 Gm. of wheat germ. Although other investigators have had success with rice polishings, our experience with it is not wide enough for us to make specific recommendations in regard to its use. Some patients complain of the taste of these materials, in which case we disguise the taste by stirring them into milk or tomato juice or by mixing them with water and adding tomato catsup. They can be added to bouillon, sprinkled over cereals or added to eggnog. We have found that a mixture of approximately 20 per cent dried brewers' yeast by weight added to 80 per cent peanut butter is acceptable to persons who like peanut butter. A mixture of this yeast and peanut butter is practical and if used wisely would go a long way toward correcting the deficiencies of protein, fats, calories and B complex vitamins in the diets of many persons.

In vitamin A deficiency, we give adults 50,000 units of vitamin A daily for at least two months. It may be given in the form of carotene or fish liver oils. The clinical response in vitamin A deficiency is often slow and it may be necessary to continue treatment over a long period of time before beneficial effects are observed.

Children with active mild rickets are given 1,600 I U of vitamin D daily in the form of fish liver oils or irradiated ergosterol. To those with advanced rickets, 5,000 I U is given, while in rare cases of refractory rickets 50,000 I U or more is often administered. We wish to point out that although a daily dose of 800 I U is considered the safe prophylactic dose for full term infants, premature infants may require 3,000 I U. In juvenile, adult and senile rickets large doses of the vitamin D concentrates, 10,000 I U daily, should be given for therapeutic purposes.

In hemorrhagic disease due to vitamin K deficiency in the newborn infant we give 1 mg. of vitamin K often by intravenous injection. To adults with vitamin K deficiency we give 1 to 5 Gm. usually by the parenteral route. In cases in which bile is excluded from the intestine, orally administered vitamin K, since it is fat soluble, must be accompanied by some bile salt preparation to aid in its absorption.

We never regard the treatment as satisfactory until the patient has gained significantly in strength and his weight has returned to normal. Unfortunately, many physicians take the point of view that deficiency diseases can be overcome by a few days treatment. This is not surprising since the immediate result of therapy is often dramatic. Nevertheless, deficiency diseases which have taken months or even years to develop cannot be eliminated quickly. We have found it wise to keep our adult patients under observation until they return to work and are able to continue to work for several months.

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT, WHICH IS A REVISION OF THE REPORT WHICH APPEARED IN THE JOURNAL OF JAN 24 1942 PAGE 295

HOWARD A CARTER Secretary

ACCEPTANCE OF ULTRAVIOLET LAMPS FOR DISINFECTING PURPOSES

After due consideration of the present status of the use of ultraviolet radiation as a germicide, in consultation with bacteriologists, physicists, chemists, ventilating engineers and other scientists, the Council on Physical Therapy has adopted the following regulations for acceptance of ultraviolet lamps for use as an adjuvant in the disinfection of air.

It is to be noted that a lamp used for disinfecting purposes is a single unit in an installation and that compliance of the ultraviolet output of a single lamp unit with the Council's requirements does not insure adequate radiant disinfection or the safety of the occupants of the room in which an installation of such lamps is in actual use. Obviously the manufacturer and distributor of such lamps must assume some responsibility for the adequacy of the lamp installation for purposes of radiant disinfection of the air and for the adequacy of the protection from injury of the occupants of the space irradiated. Concerning these questions the Council cannot undertake supervision or assume responsibility for the satisfactory performance of any particular installation.

The total amount of direct and scattered ultraviolet radiation incident on the occupants must be kept below the level that will produce conjunctivitis, erythema and any other (at present unforeseen) injurious physiologic effects that may arise from prolonged irradiation. This requirement should be met by a suitable arrangement of the lamp fixtures and light baffles and not by requiring the usual occupants to wear glasses and a special covering of the parts of the body (face hands) normally uncovered.

The efficiency of the emission line 2537 Å (angstroms) in producing an erythema is very high and in contrast the efficiency of this emission line in producing tan is very low.¹ As a result of this slow acting protective mechanism (tanning, skin pigmentation) the irradiated occupant of the room may suffer severe burns. The data governing the Council's acceptance of Sun Lamps show that an intensity of 36 microwatts per square centimeter can produce an erythema in fifteen minutes. If the reciprocity law holds for very low intensities and long exposures, then the total intensity of the ultraviolet radiation (diffusely reflected from the walls and fixtures and emanating directly from the lamp) incident on the occupant for seven hours or less should not exceed five-tenths microwatt per square centimeter ($0.5 \mu\text{W}/\text{cm}^2$) and for continuous exposure (twenty-four hours a day) should not exceed 0.1 microwatt per square centimeter of wavelength 2537 Å. How to design the lamp installation to meet the requirements for adequate disinfection of a room and at the same time protect the occupants is a problem for solution by the sanitary engineer.

At the present juncture the design and installation of ultraviolet lamps in their fixtures for disinfecting purposes is empirical and the adequacy of disinfection by any given installation of lamps must be judged by clinical experience. For example clinical evidence has been submitted to the Council showing that in a scarlet fever ward (size about 60 by 27 by 11 feet) containing sixteen cubicles four lamp units each one emitting a radiant flux of 30 microwatts per square centimeter at 1 meter were found inadequate but eight lamp units in the ward, each unit protecting two cubicles, and a ninth unit at the entrance prevented cross infection. This is a rather high intensity (requiring twenty minutes calculated time to produce a minimum perceptible erythema) incident on a person of average height standing directly under a lamp fixture suspended from a ceiling of average height. A greater number of lamps each one

of lower ultraviolet intensity (say 20 microwatts per square centimeter at 1 meter) and lower power input, more evenly distributed throughout the room should be safer and equally efficient in disinfecting the air. This is a matter of engineering design, beyond the scope of the Council's purview.

PHYSICAL DATA ON DISINFECTING LAMPS

Experimentally, applying equal amounts of energy at different wavelengths, it is found that the spectral band at 2,652 Å appears to produce the maximum bactericidal action and that the emission band at 2,537 Å is only about 70 per cent as effective. This difference in effectiveness is negligible in the present considerations because in readily obtainable sources of germicidal radiation, especially in the low vapor pressure (high voltage) mercury discharge tube, which is well adapted for killing microorganisms, the ultraviolet radiant power of wavelength 2,652 Å is less than 0.2 per cent of that of wavelength 2,537 Å, the resonance emission band that dominates the whole ultraviolet spectrum of this type of lamp.

About 90 per cent or more of the total biologically effective ultraviolet radiation of wavelengths shorter than 3,132 Å emitted by the low pressure mercury discharge (whether in quartz or in a transparent glass tube) is concentrated in the emission line at 2537 Å. For this reason the emission line at 2537 Å, logically and by common consent, is taken as the standard of homogeneous ultraviolet radiation for evaluating the ultraviolet output of germicidal lamps, just as the wavelength 2,967 Å in the high vapor pressure (low voltage) mercury arc is taken as the standard of homogeneous ultraviolet erythemogenic and antirachitic radiation in evaluating the ultraviolet output of therapeutic lamps.

The low pressure mercury discharge in a suitable glass tube or in a suitably filter jacketed quartz tube which readily transmits the strong, highly germicidal emission line at 2537 Å but is opaque to wavelengths shorter than about 2,200 Å (that generate ozone) appears suitable to supplement other means of disinfection when operated under controlled conditions and limited to certain types of applications. In other words the room must be relatively free from dust and infecting bacteria, without the use of ultraviolet disinfecting lamps. Ultraviolet radiation is not a substitute for cleanliness.

From the evidence available it appears that a minimum of 5,000 to 10,000 microwatt seconds per square centimeter ($\mu\text{W sec}/\text{cm}^2$ or 50,000 to 100,000 ergs/cm²) of homogeneous radiation of wavelength 2,537 Å is required to produce adequate (practically 100 per cent) killing of microorganisms, especially bacteria. With an exposure of fifty to one hundred seconds this will require an intensity of 100 microwatts per square centimeter.

The Council has adopted 100 microwatts per square centimeter of homogeneous radiation of wavelength 2,537 angstroms as the unit of germicidal intensity (G U) that is $1 \text{ G U} = 100 \mu\text{W}/\text{cm}^2$ of radiation of wavelength 2,537 Å.

Since the ultraviolet emission from the low vapor pressure mercury discharge tube is practically homogeneous radiation of wavelength 2537 Å, such a lamp can be readily calibrated in absolute value and used as a standard. The intensity at 1 meter may be only one fifth of the Council's unit or 20 microwatts per square centimeter for safety to the occupants. This will require a minimum exposure of two hundred and fifty to five hundred seconds for adequate disinfection which will depend on the rate of circulation and average distance of the air in front of the lamp. Evidence has been submitted to the Council showing that cross infection in a contagious ward may be prevented by using a sufficient number of lamp units each unit having an intensity of 30 microwatts per square centimeter at a distance of 1 meter from the burner. This will require an exposure of one hundred and sixty-seven to three hundred and thirty-four seconds for adequate disinfection which implies a slow movement of the air in front of the lamp installation.

SCOPE OF THE COUNCIL'S ACCEPTANCE OF ULTRAVIOLET LAMPS FOR DISINFECTING PURPOSES

The Council has given careful consideration to the feeling expressed by manufacturers vitally concerned in the matter that the general acceptance of the use of ultraviolet radiation as a

¹ Luckiesh, Matthew and Taylor, A. H. Production of Erythema and Tan by Ultraviolet Energy. J. A. M. A. 112: 2511 (June 17) 1939

sanitary agent may necessitate some form of regulation, and that ultraviolet generating units offered to the public and medical profession may be classed with antiseptic agents requiring a degree of control of their potency and keeping qualities.

Under this caption is given in analysis of various proposed applications of ultraviolet radiation as a disinfectant and a statement of the specific applications that appear to fall within the Council's purview.

The advantages and disadvantages of the use of germicidal ultraviolet radiation for sterilizing purposes are summarized in the recent (1911) issue of "The Chemical Action of Ultraviolet Rays," by Ellis and Wells, second edition by Francis F. Heyroth (see p. 718, "The Sterilization of Water"). L. R. Koller (*J. Applied Physics* 10:629, 1939) found that while sterilization of glassware and dishes is possible by means of ultraviolet radiation it was very important to start with fairly clean surfaces. Practically the same results are reported in a recent investigation by J. W. Applin and I. W. Turner on the 'Bactericidal Effect of Ultraviolet Rays on Micro-organisms on Restaurant Glassware' (*Proc. Soc. Exper. Biol. & Med.* 47:51, 1941). While they noted decided improvement on irradiation, complete sterilization did not result in every case. In this connection reference is made to an editorial on "Disinfection by Light" (*Brit. M. J.* 2:707 [Nov. 23] 1940) showing that much remains to be done in studying the capacity of such lamps to reduce the dangerous bacterial content of air, not only under controlled laboratory conditions, but also in the more difficult and varied circumstances of practical use.

In this connection it is important to note that in order to kill a micro-organism a direct hit by ultraviolet rays of sufficient intensity is required. This is difficult to accomplish on the edge of a drinking cup, also in a liquid containing suspended matter or in air laden with dust particles that shield the organism. To provide adequate sterilization a germicide must effect practically 100 per cent killing. Ultraviolet germicidal rays cannot penetrate deeply and hence may be absorbed by finger marks, saliva, cosmetics or other contamination on a drinking cup. The ultraviolet germicidal lamp, therefore, appears to be an uncertain means of sterilizing solid objects (drinking cups, combs, brushes, shaving utensils, shoes, toilet seats) even if irradiation of the whole surface is possible.

At this time satisfactory evidence is not available to warrant acceptance of ultraviolet lamps by the Council for disinfecting solids. Furthermore, the Council is not fully convinced at the present time that it should assume the responsibility in this matter. The whole subject is too new, too complex and apparently too uncertain where virulent organisms (e. g., typhoid) may be concerned in spreading epidemics.

Some evidence seems to indicate that the ultraviolet germicidal lamp can be used for sterilizing water, beverages and the like but only after adequate removal of suspended material, and it is applicable only to liquids which are highly transparent to ultraviolet germicidal radiation.

In a few cases in which chemical methods of sterilization of water may be harmful, as for example for surgical purposes (mentioned by Ellis and Wells), under certain conditions irradiation with ultraviolet lamps is reported to be useful. This acceptance is not concerned with such applications, which do not appear to be very wide. Moreover, it is not clear wherein sterilization by ultraviolet rays is superior to boiling or distillation of the water used.

The use of ultraviolet radiation for disinfecting air in industrial plants, barracks, school rooms, assembly halls, refrigerators and so on also appears to be outside the Council's purview. In fact, at this juncture the whole question of the use of ultraviolet radiation for disinfecting purposes is too complex and too little understood for the Council to do more than attempt to keep the medical profession informed regarding particular ultraviolet lamps that are acceptable for use in this method of disinfecting air in hospitals, nurseries and operating rooms (relatively free from dust) as practiced by present day empirical methods.

TENTATIVE REQUIREMENTS FOR ACCEPTANCE OF ULTRAVIOLET LAMPS FOR DISINFECTING AIR

Clinical evidence submitted to the Council shows that under properly controlled conditions killing of air borne micro-organisms by ultraviolet rays may be used to supplement other methods of disinfecting air for prevention of cross infection in contagious wards in nurseries and hospitals, and for reducing air borne infection of wounds in operating rooms. The deleterious effects of ozone generated by ultraviolet lamps is recognized. The Council therefore requires for acceptability of ultraviolet disinfecting lamps that, under suitable ventilation, in the space near the occupants of the room the concentration of ozone shall not exceed one part in ten million. However, in view of the recent researches by Witheridge and Yaglou² showing that a much lower concentration (1 part in 25 million) is irritating to the mucous membranes of the upper respiratory tract, this specification of 1 part in 10 million is tentative awaiting confirmation of the evidence that a lower concentration of ozone is desirable in nurseries and hospital rooms occupied twenty-four hours a day. If the odor of ozone is distinctly perceptible the Council recommends increased ventilation.

In considering ultraviolet generators for disinfecting purposes the Council makes no distinction between lamps for use in air conditioning ducts and lamps for use in open rooms in which there is only a slow circulation of air. In both cases a sufficient number of lamps must be provided to insure adequate disinfection of the air as determined by approved culture tests or other accepted procedures. So that an ultraviolet output above the minimum value for adequate disinfection may be maintained, the Council recommends that the ultraviolet intensity of each lamp unit be measured at least once a month.

To comply with the Council's requirements the ultraviolet spectral energy distribution of the disinfecting lamp shall be comparable in lethal effectiveness with the low vapor pressure mercury discharge tube, in which the dominant radiation is of wavelength 2,537A.

The minimum intensity at right angles to and at a distance of 1 meter from the plane of the lamp tube in its fixture shall not be less than the germicidal equivalent of 20 microwatts per square centimeter of homogeneous radiation of wavelength 2,537A. The useful life of the lamp shall not be less than four thousand hours. During this period the ultraviolet output shall not fall below the herein specified minimum intensity. To meet this requirement the lamp may be provided with a voltage regulator to compensate for the decrease in intensity of ultraviolet with usage, or the lamp may emit a sufficient excess of ultraviolet radiation when new, so that the output shall not fall below the specified minimum value ($20 \mu\text{W}/\text{cm}^2$ at 1 m) in less than four thousand hours' operation. In either case the installation shall be provided with adequate safeguards against over exposure of the occupants of the room to ultraviolet radiation. The burner of the lamp shall be of glass or of suitably filter jacketed quartz, highly transparent to the emission line at 2,537A, and opaque to radiation of wavelengths shorter than 2,200A, to prevent the generation of an injurious amount of ozone, largely produced by these short wavelengths. To insure compliance with these requirements the lamp may consist of one, two or three tubes, mounted and operated as a unit.

For consideration of acceptance by the Council, the manufacturer shall submit a lamp unit in its fixture, permanently marked as to its useful life, and its radiant flux in microwatts per square centimeter of wavelength 2,537A, at 1 meter under the normal power input used to insure a useful life of four thousand hours or more. In addition the manufacturer shall submit satisfactory clinical evidence, obtained over a period of not less than four winter months, of the effectiveness of an installation of such lamps in maintaining sterilized conditions in the space (hospital, nursery) subjected to radiant disinfection. For statistical purposes in improving installations, included in this evidence (for the present at least) is to be a statement of (1) the size of the room and the average number of occupants (and their ailments), (2) the number and arrangement of the lamp units, (3) kind and amount of ventilation and (4) the procedure to determine and maintain the intensity above the minimum level during the useful life of the lamp.

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION
OF THE FOLLOWING REPORT HOWARD A. CARTER, Secretary

**SUN-KRAFT LAMP
(Sunlamp)
NOT ACCEPTABLE**

Manufacturer Sun-Kraft Company, Inc., 1809 North Ashland
Avenue, Chicago

During recent months a great many inquiries regarding the Sun-Kraft Lamp have come to the Council on Physical Therapy, and the Council considered it advisable to prepare a statement of its opinion of the lamp for the information of the profession and the public.

It is apparent both from the description of the unit in the advertising pamphlets and from tests on the lamp that the characteristics of the radiation emitted by the burner would not meet the Council's requirements for acceptance of sun-lamps. According to the advertising statements, 'As its quartz tube does not generate any heat whatever' and 'Uses only 20 watts electricity,' the burner is obviously of the so called 'cold quartz' or high voltage low pressure variety, of which at least 95 per cent of all the radiant energy output in the ultra-violet region is of the 2537 angstrom band. An acceptable sunlamp should be free of these radiations or, in other words, its ultraviolet radiation output shall not differ essentially from that of the natural sun.

The Council examined the Sun Kraft Lamp and reviewed radiometric measurements made on it by a reliable laboratory. The spectral quality and total intensity do not meet the Council's requirements for acceptability as a 'sun lamp.'

Furthermore statements in the advertising indicate that the device must be operated at a distance of less than 6 inches—thus the lamp cannot be very powerful. If much ozone (greater than 1 part in 25 million) is developed near the patient it will cause irritation of the upper respiratory tract because of its high toxicity.

Many unwarranted therapeutic claims are made for the lamp. 'Sun-Kraft A Promoter and Preserver of Good Health' is a headline taken from one of the advertising pamphlets. Following are unsubstantiated unacceptable claims made in the copy:

Relieves Dandruff

Sun Kraft generated ultraviolet eliminates itchy dandruff, checks excessive loss of hair. Regular use will induce new hair growths and restore natural hair color and health by increasing scalp circulation and rejuvenating hair glands.

Increases Resistance to Colds

Six minute exposure twice weekly to Sun Kraft ultraviolet promotes generous production of Vitamin D in the body thus increases resistance to colds.

Gives Positive Antiseptics

For positive antiseptic action in treating cuts, wounds, bruises, Sun Kraft Ultraviolet disinfects completely in one minute! In addition it induces quick healing. Its benevolent rays will clear up Athlete's Foot, acne, pimples, psoriasis and blackheads in a few treatments. produce lasting relief from pains caused by arthritis, lumbago and rheumatism.

The outstanding effects are:

- increase of self-disinfecting and protective power of the skin
- Activation of the general body defense mechanisms against disease
- Normalization of the mineral metabolism of the body
- Lowering of blood pressure and increasing blood circulation

In the opinion of the Council the foregoing statements, for which there is no substantiating scientific evidence, that the Sun-Kraft Lamps will do these things lead to a false sense of security on the part of the user of the apparatus and thus are regarded misleading.

The Council on Physical Therapy voted to declare the Sun-Kraft Lamp unacceptable for inclusion in its list of accepted devices because the characteristics of the radiation emitted by the lamp do not meet the Council's requirements for a sun lamp sold to the public and because of the unwarranted therapeutic claims made for the lamps.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E. SMITH, M.D., Secretary

NEO-SYNEPHRINE HYDROCHLORIDE (See New and Nonofficial Remedies 1942, p. 249)

The following dosage forms have been accepted
FREDERICK STEARNS & COMPANY, DETROIT

Neo-Synephrine Hydrochloride Emulsion 1% 15 cc bottle Neo-synephrine hydrochloride 1 per cent, sodium benzoate 0.4 per cent in a mineral oil and water emulsion containing acacia preserved with chlorobutanol 0.5 per cent.

Neo-Synephrine Hydrochloride Emulsion 10% 3 cc bottle Neo-synephrine hydrochloride 10 per cent, sodium benzoate 0.4 per cent in a mineral oil and water emulsion containing acacia preserved with ascorbic acid 1.0 per cent, sodium bisulfite 0.1 per cent and chlorobutanol 0.5 per cent.

ESTRONE (THEELIN) (See New and Nonofficial Remedies, 1942, p. 377)

The following dosage forms have been accepted
ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

Ampoules Estrone Suspension 2 mg in 1 cc (20,000 I U) Each cubic centimeter contains estrone crystals 2 mg in aqueous suspension with gum acacia.

PARKE, DAVIS & CO., DETROIT

Ampoule Theelin Aqueous Suspension 2 mg per cc (20,000 I U)

Ampoule Theelin in Peanut Oil 1 cc (5,000 I U) Each cubic centimeter contains 0.5 mg of theelin.

HALIBUT LIVER OIL (See New and Nonofficial Remedies 1942, p. 577)

The following dosage form has been accepted

THE LEPJOHN COMPANY, KALAMAZOO, MICH.

Capsules Halibut Liver Oil 3 minims Each capsule has a potency of not less than 10,000 U S P units of vitamin A and not less than 170 U S P units of vitamin D.

MENADIONE (See New and Nonofficial Remedies, 1942, p. 584)

The following dosage form has been accepted

SCHIEFFELIN & COMPANY, NEW YORK

Menadione (in sesame oil) 1 mg per cc 10 cc vials Each cubic centimeter contains 1 mg menadione.

SODIUM CITRATE (See New and Nonofficial Remedies 1942 p. 427)

The following dosage form has been accepted

GEORGE A. BREON & COMPANY, INC., KANSAS CITY, MO.

Ampul Solution Sodium Citrate 2½% W/V 50 cc A sterile solution containing in each cubic centimeter sodium citrate-U S P 0.025 Gm (0.38 gram).

SULFATHIAZOLE (See New and Nonofficial Remedies 1942 p. 150)

The following dosage forms have been accepted

PITMAN-MOORE COMPANY, INDIANAPOLIS

Tablets Sulfathiazole 0.5 Gm

Children's Tablets Sulfathiazole 0.25 Gm

DEXTROSE (See New and Nonofficial Remedies 1942 p. 418)

The following dosage form has been accepted

JOHN WYETH & BROTHER, INC., PHILADELPHIA

Dextrose Injection, 50% W/V, U S P 50 cc and 100 cc Each 10 cc contains 5 Gm of dextrose in distilled water.

tors or executives at any medical school or scientific institution with a view to their needs for experimental laboratory mammals over a long period of time so that, if it seems desirable and possible, arrangement for production and supply of these animals can be made.

THE PRESIDENT-ELECT—HERMAN KRETSCHMER

Herman Louis Kretschmer of Chicago was elected President-Elect of the American Medical Association at the annual session in Chicago, June 9, by unanimous action of the House of Delegates. Dr. Kretschmer was born in Chicago on April 22, 1879. He received the degree of doctor of medicine from Northwestern University Medical School in 1904 from which date he has devoted himself continuously to the advancement of his chosen profession. He became urologist of the Presbyterian Hospital, attending urologist to the Children's Memorial Hospital and clinical professor of surgery in Rush Medical College. From the beginning of his career he became associated with practically all organizations in his specialty, serving as president of the American Board of Urology, chairman and secretary of the Section on Urology of the American Medical Association, president of the American Urological Association, president of the American Association of Genito-Urinary Surgeons and president of the Clinical Society of Genito-Urinary Surgeons. His leadership was also recognized by membership in the International Society of Urologists and election to corresponding membership in the German and Hungarian urologic associations. In 1931 he was president of the Chicago Medical Society and served for some years as a member of its council. For more than ten years he devoted himself in the American Medical Association to his work as treasurer, sitting regularly with the Board of Trustees and giving invaluable advice in the field of investments. He is a fellow of the American College of Surgeons and of the American Radium Society. In 1942 he was cited by Northwestern University School of Medicine as one of its distinguished alumni. His election to the presidency is a recognition of service and of much time and wisdom given to the affairs of the Association.

HERMAN LOUIS KRETSCHMER, M.D.
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

MEDICAL PROBLEMS OF TANK WARFARE

Mechanized warfare is fought today with increased speed and power. Col. Daniel L. Borden's¹ study of the medical problems of tank warfare will help medical officers appreciate these changes. A modern tank is a mobile, concentrated source of fire power. Since the first appearance of the tank in World War I on Sept. 15, 1916 the slow tread of 4 miles an hour has been increased to 30 miles an hour, fire power has also increased. The all metal body encloses a high speed engine, ammunition, grenades, bombs, Verey cartridges, batteries, radio, firearms, fuel oil and an alcohol compass in close proximity to the human crew. Special training is

required to render efficient medical service to the personnel of tank battalions. Tank fighters must be youthful, aggressive, courageous, tough, they must not be tall, too heavy or sensitive to dust, nor have a tendency toward claustrophobia.

The elimination of flat surfaces and angles in tanks favors the ricocheting of projectiles and makes a disabled tank a target of great danger to soldiers who seek shelter nearby. One third of the battle casualties in tank crews in the Middle East with the British occurred outside the tank when men were caught seeking shelter near a disabled tank.

Although excessive heat in tanks is a serious medical problem, the British in the Middle East have reported few cases of heat exhaustion, if possible, tank crews

should not be subjected to more than one week of active fighting. Burns constitute from 27 to 30 per cent of the British tank casualties. The crew, particularly the commanders, occasionally protrude their heads out of the turrets and so become exposed to gun fire. Temporary sound deafness results from the roar of engine and tank, aggravated by gun fire within a resounding compartment. The surgeon of the armored forces at Fort Knox, Col. A. L. Gorby, reported that in training there were surprisingly few injuries, the most frequent being the loss of the distal phalanges of the fingers due to slamming of the heavy tank doors, a hazard that has been largely eliminated in the newer tanks. Contusions of the chest and abdomen occur due to sudden stopping at the bottom of a ditch or against a trap. Occasionally

¹ Borden, Daniel L. Casualties and Medical Problems of Tank Warfare, M. Ann. District of Columbia 12:43 (Feb.) 1943.

a small tree which failed to be knocked down by the tank enters through a porthole and injures the crew. Hand injuries result from slipping on muddy tanks while mounting or dismounting. Gunshot wounds may occur in tanks as the result of dropping ammunition. Fatalities occasionally occur when a tank turns over pinning a soldier in the turret or beneath the tierd.

The evacuation of wounded from tanks has been the subject of extensive research. The American Armored Forces Board has rejected the British sling method of removing disabled men from tanks. When immediate action is necessary, the wounded are often pulled out by tying feet together and hauling away. A badly injured man may be given the contents of a small ampule of chloroform to inhale until he is unconscious, in order that he may be removed from the tank without pain and with lessened shock. Our army also employs the pistol-belt-suspender method, one belt being slipped under the armpits, tightened and used as a sling and a second belt carried between the back of the sling and the man's body, thus making a hoist device. Other methods of removing the disabled from tanks are being studied. The evacuation of wounded from tanks remains, however, a problem to be solved by any method that will accomplish the purpose under the circumstances.

Another difficult task is that of maintaining medical contact between swiftly moving motorized groups. The battalion surgeon must have at his command a radio-directed armored car or a half-track protected ambulance, and a clearing station, where provision can be made by returning wounded men in airplanes to their base, must be available. The medical department obviously must do more than care for the sick, its training must provide instruction in methods of communication, motor maintenance, identification of hostile aircraft and map reading. The medical officer serving with tank forces must be prepared to be a mechanic with a crowbar for his instrument of approach and a soldier to face shells and bombs, as well as a physician.

TUMOR ENZYMOLOGY

The metabolism of normal tissues is carried on by enzymic catalysis of definite patterns. These patterns may be disturbed by various causes, e.g. nutritional deficiencies, toxic actions and tumors. In the biochemical approach to the cancer problem tumor enzymology¹ is receiving closer and closer systematic attention. Comparisons are made of the enzymic activities of neoplastic, mostly cancerous, tissue and of the normal tissues of origin, also of enzymic processes of normal animals and of tumor-bearing animals.

Greenstein,² in a comprehensive review of work on tumor enzymology, emphasizes that no simple generalization covers the enzymatic behavior of all or any one

group of tumors," certain statements to the contrary notwithstanding. The range of enzymic activity in hepatoma, in lymphoma and in mammary and other tumors in mice on the whole is narrower than in the normal tissues of the sites of origin of these tumors, owing, it may be, to loss in specific function as the normal tissue becomes involved in tumor growth. The interesting question of acid phosphatase activity in normal prostatic tissue as compared with that of primary prostatic carcinoma invites further study. Undoubtedly in time facts will be accumulated on the basis of which generalizations can be made.

Studies of remote and systemic effects on enzymes by tumor growth have given more definite results, but this work is also in the stage of detailed observation. The evidence at hand does not justify any serious attempt at explaining just how such effects are produced. In tumor-bearing animals tissues far removed from the tumor have shown profound changes from the normal in certain enzyme systems. For instance catalase which has been studied most, is nearly always reduced below normal in the liver and kidney in mice and rats with various types of tumors elsewhere. Greenstein recalls that low catalase values have been found in the liver after death from various forms of human cancer. The remote effects of tumor growth on catalase and also other enzymes keep step with the ups and downs in the growth of the tumor, and on the removal or regression of the tumor the catalase content returns to normal. In other words, the effect in question is related directly to the presence of the tumor.

The many attempts to find a general test for cancer based on changes in the blood in the disease have not met with practical success, but objective studies of the blood in cancer are yielding results of scientific as well as clinical value. Greenstein mentions particularly the decrease of serum esterase and lipase activity in tumors of different species, the rise in serum phosphatase, particularly the acid form, in prostatic carcinoma, which is of such special interest these days, and finally the progressive loss of hemoglobin in the course of various animal tumors. Whether the anemic states in human cancer are dependent on the lowering of catalase and of the hemoglobin level as in animals remains to be determined. In connection with the significance of changes in the blood in cancer it is of particular interest to note that serial phosphatase tests of the serum are now essential in the diagnosis and treatment of carcinoma of the prostate.³

The study of the enzymatic phenomena of neoplastic growth has bearings on fundamental as well as practical

THE DISTINGUISHED SERVICE AWARD TO JOSLIN

The Distinguished Service Medal and Award of the American Medical Association for 1943 were conferred on Dr. Elliott Proctor Joslin, world famous as a contributor to our knowledge of diabetes and as an educator in that field. Dr. Joslin was born in Oxford, Mass., June 6, 1869. Following the receipt of the B. A. degree from Yale in 1890 and the Ph. B. from the Sheffield Scientific School in 1891 he was graduated as a doctor of medicine by Harvard in 1895. In 1914 he received the honorary M. A. from Yale and in 1940 the honorary D. Sc. from Harvard. In 1895 he began the practice of medicine in Boston at the same time serving as an educator in Harvard Medical School becoming assistant in physiologic chemistry from 1898 to 1900, assistant in theory and practice of physics from 1900 to 1905, instructor from 1905 to 1912, assistant professor of the theory and practice of physics from 1912 to 1921, clinical professor of medicine from 1922 to 1937 and since that time emeritus professor. He has been at the same time consulting physician of the City Hospital and medical director of the George F. Baker Clinic in the New England Deaconess Hospital. During World War I he entered as a major in the medical corps in 1918 and was promoted shortly to lieutenant colonel. He is a member of the Association of American Physicians, the American Academy of Arts and Sciences, the American Physiological Society and other scientific organizations. He was chairman of the Section on Practice of Medicine of the American Medical Association in 1924-25 and president of the Interstate Postgraduate Medical Association in 1936. He is honorary president of the American Diabetes Association. Various important lectures such as the Stephen Walter Ransom Lecture of Northwestern University School of Medicine in 1937, the Harvey Society Lecture in Boston in 1930 and the two Malthus lectures and a clinic in Oslo

in 1938 mark his career. From time to time he has traveled throughout the nation extending education about diabetes to the medical profession and to the public. On patients who have survived diabetes for various periods of time he confers bronze, silver or gold medals, recently having conferred such a medal on a woman who had diabetes for more than fifty years. In 1932 Dr. Joslin received the Kober Medal of the Association of American Physicians. As a part of his contribution to education in his field he published in 1916 the first edition of "The Treatment of Diabetes Mellitus," now in its seventh edition, also "A Diabetic Manual" in 1918, which is now in its seventh edition. His publications include more than one hundred smaller contributions to medical literature in his field. The award to Dr. Joslin of this great honor adds further to the distinguished list of those already recognized, which now includes Dr. Rudolph Matas in 1938, Dr. James B. Herrick in 1939, Dr. Chevalier Jackson in 1940, Dr. James Ewing in 1941 and Dr. Ludvig Hektoen in 1942.

ELLIOTT PROCTOR JOSLIN, M.D.
AWARDED DISTINGUISHED SERVICE MEDAL

CENSORSHIP OF MEDICAL PERIODICALS

A letter from the Office of Censorship in Washington requests the editor of THE JOURNAL to call the attention of editors of state medical journals and of bulletins of county medical societies particularly and also editors of all other medical publications to the fact that it is exceedingly inadvisable to publish uncensored letters coming from doctors in the service, particularly when they include the addresses of

the physicians. Already in several instances such letters have served to reveal the identity of troops overseas. The Code of Wartime Practices for the American Press calls attention to the great danger that is inherent in this practice. All publications are particularly requested to avoid identification of soldiers with their troop units when they are overseas, about to embark or on defense (as distinguished from training) activities in the United States. In the case of Naval personnel the identification of ships and bases is to be especially avoided. Editors of all publications will, we are sure, do their utmost to cooperate with the Office of Censorship in Washington, since the revealing of units to which physicians are attached may be of great value to the enemy in determining the character of the armed force with which it has to deal. When in doubt, editors will do well to get a direct response from the Office of Censorship regarding the release of any special item.

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on War Participation of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war and such other information and announcements as will be useful to the medical profession

FUEL RATIONING AND PUBLIC HEALTH

JOEL DEAN

Director Fuel Rationing Division Office of Price Administration
Washington, D C

When it became clear that fuel oil would be rationed in a majority of the states, grave concern was felt for the effect on the public health. Many and dire were the prophecies of epidemics of communicable disease and of deaths from pneumonia, influenza and other respiratory ailments, and of resulting breakdown of public morale. A study of the medical aspect of fuel rationing was conducted by Bristol,¹ and the findings were used as a basis of ration order 11² (fuel oil), which became effective Oct 22, 1942.

In that report a careful distinction was made between a "minimum standard" which would not jeopardize health for persons in normal physical condition and the "comfort zone" which physicians, engineers and public health workers interested in the subject of indoor heating and ventilation had become accustomed to think of as indicative of ideal combinations of room temperature and relative humidity. Necessarily the fuel oil regulations embodied in ration order 11 were directed to maintenance of the "minimum standard." The report also distinguished categories of persons who could not be subjected even to this "minimum standard." The regulations consequently recognized infancy, sickness and infirmity as reasons for additional fuel rations.

From time to time, especially during the first two or three months, alarming reports of illness, epidemic and death reached the national office. Every such case was investigated promptly in order to provide immediate relief if needed. No single case of death due to fuel oil rationing directly or indirectly has been substantiated nor any epidemic unearthed that could be laid to fuel oil rationing. In almost every report of sickness or other hardship investigation showed either that relief had already been afforded through action of the local war price and rationing board or that the condition had been grossly exaggerated.

Typical of these exaggerated reports was an anonymous telegram stating that children were dying of pneumonia in a tenement of the capital city because of lack of fuel oil. This telegram was referred to the Fuel Rationing Division and an investigation was made in cooperation with police and public welfare agencies. An infant son of one of the tenants had died of pneumonia in the hospital a few days earlier. No other case of pneumonia existed among the occupants of the building, infant or adult. Fuel oil was not used and never had been used to heat the premises. Another typical case was a telegram received toward the close of the day from a householder in northern New England alleging that several sick members of the family were in imminent danger of death because they had no fuel oil and the local board had not issued a ration for the premises. Immediate investigation revealed that the ration had been issued already by the local board and had reached the complainant within an hour of dispatching the telegram, that delivery of fuel oil had been made a couple of hours later and that no member of the household was dangerously or even seriously ill.

Notwithstanding our growing disillusionment we never permitted ourselves to relax our vigilance and every reported case was investigated promptly and thoroughly. With a program operative in thirty-three states and the District of Columbia and administered by thousands of local officials, it was inevitable that some genuine cases appeared, and even a few that had been badly handled. The percentage of these was so small however that the conclusion we reached in the Fuel Rationing Division was that no real detriment to public health had resulted from ration order 11.

We felt nevertheless that before entering on the second heating season under fuel rationing, this conclusion should be checked against the experience of public health authorities throughout the rationed area. On Feb 23, 1943 therefore I addressed a letter to representative health officers requesting information (1) as to how fuel oil rationing had affected public health and (2) as to what changes in the regulations were recommended from that point of view and (3) as to whether a general conference of public health officials should be convened to discuss revision of the rationing plan. Replies were received from city, county and state officers of nineteen states and the District of Columbia.

Significantly the fourteen states not represented in the replies are those which have had less severe weather and from which fewer hardship cases have been reported. It is a reasonable inference that failure to reply is equivalent to a statement that no serious impairment of public health was observed in those states. It is not the experience of the Fuel Rationing Division that it is usual to suffer in silence or to decline an express invitation to complain if there is anything to complain about.

The replies from the nineteen states and the District of Columbia, while frankly reporting some hardship cases and offering some adverse criticism, indicate clearly that in the nearly unanimous judgment of the responding authorities no impairment of public health resulted from rationing fuel oil that ration order 11 needs only minor adjustment to satisfy all requirements of public health, and that such revision is not of sufficient gravity to warrant a general conference of public health officers.

Tabulation of the replies shows the following effects on public health:

DEATH

- 10 per cent reported deaths allegedly due to lack of fuel oil as cause or contributory circumstance but indicated that this was doubtful and had not been investigated.
- 25 per cent stated positively no such deaths had occurred.
- 65 per cent did not report any deaths.

ILLNESS

- 10 per cent reported considerable illness.
- 20 per cent reported some illness due to lack of fuel oil.
- 40 per cent stated positively that no illness had been caused by rationing fuel oil.
- 15 per cent stated that decreased household temperatures had improved public health.

EPIDEMIC

- 100 per cent did not report epidemic situations.

1. Bristol, Leverett D. Medical and Public Health Aspects of Heating Oil Rationing. *Am Soc Heating & Ventilating Engineers Journal* Section on Heating, October 1942.
2. OPA R 1115. Fuel Oil Rationing, Regulations Ration Order No 11 title 32 National Defense chapter XI Office of Price Administration.

The incidence of fuel oil rationing was heaviest in New England and northern New York, owing to the greater severity of the winter there and the greater distance of that area from the source of supply. It was to be expected, therefore, that from this region would come the most adverse reports. Of Massachusetts one reply states that "there appears to have been an appreciable increase in the number of deaths directly attributable to the fuel shortage." In 1 instance in New York, a letter says, "it has been claimed that death occurred in the family due to an insufficient amount of fuel oil for heating purposes." Against these must be set the following two reports by health officers in the same area: 1 "We, in this department, and some of the voluntary health agencies, do not believe that fuel rationing, at least not directly, has affected the health of the community adversely." 2 "No deaths and no illnesses were caused by lack of heat insofar as we are able to determine."

Naturally the principle effects noted relate to respiratory ailments. The majority of all reports received state that there was no increase in the number of these that could be attributed to lack of fuel oil. In New Jersey the state department of health made a survey of local health units, and reports concerning them that "a few state that cases of illness, chiefly respiratory, have come to their attention in which the patient or family alleged that the lack of heat in homes was the cause or contributing factor." Such cases, the reports point out, were few in number, and they conclude "Only a very few complaints have been filed with us during the current winter regarding homes being poorly heated due to our present fuel oil shortage. In each instance our investigation disclosed that the complaints were not well founded as no acute distress or illness existed." Only two replies to my inquiry mentioned pneumonia. Both were from New York. One authority reported "Our pneumonia rate, though a little higher than for approximately the same period last winter, is below the five year average, and we know of no unusual incidence of colds and other respiratory affections commonly referred to as 'grippe'." Another stated "During the month of January there had been a 30 per cent increase in the pneumonia death rate as compared with January 1942. There are so many factors entering into the increase that it would be impossible to say whether or not the fuel shortage had anything to do with it, but this seems to me to be rather doubtful."

Reports from the Southern and Middle Western states are that no illnesses or deaths in those regions were due to lack of fuel oil. No reply reported any epidemic anywhere.

The only point of difference between the conclusion we had already reached in the Fuel Rationing Division and the summary of these replies concerns the possibility that some deaths reported from Massachusetts and one death reported from New York may have been due to lack of fuel oil for heating purposes. Without full investigation the validity and degree of this difference cannot be determined accurately, but it is evident that such cases are highly exceptional and relatively few, even if they can be established.

A recent canvass by Bristol³ of the physicians and health officers who assisted him in his original study indicates no general divergence of opinion from that expressed by the majority of health officers who replied to my letter.

In his original report, Bristol¹ said "The public should be made to understand that, by a reasonable amount of extra clothing, the body adjusts itself readily to temperatures at least 10 degrees below what we in the United States consider the standard temperature for dwelling houses. Experience of those in foreign countries attest this fact. Some medical and public health authorities have indicated that not only would it be safe but actually beneficial to keep temperatures quite a few degrees lower than the commonly accepted standard if additional clothing is worn." Public welfare workers assured us that in their experience small houses and apartments of people in the lower income brackets were frequently heated to an unhealthy temperature.

The Fuel Rationing Division was hopeful that over a long period of time the beneficial results of slightly lower indoor temperatures could be established⁴ but did not anticipate that one year of fuel rationing would be sufficient to demonstrate it. It is an agreeable surprise, consequently, when a health officer writes from Missouri that "It is my opinion that public health has benefitted from fuel rationing in that the temperature of homes was reduced," and another health officer reports of a family in Virginia that they "had kept their house at 60 degrees for the second floor and 65 downstairs through the winter and had been both happier and more comfortable than they were when they had it much hotter the year before." It is also a proof of the underlying wisdom of Bristol's report and of the essential soundness of the fuel oil rationing plan.

ARMY

THE OLIVER GENERAL HOSPITAL

The U. S. Army Oliver General Hospital at Augusta, Ga., was formally dedicated on April 18 and the forty minute program was broadcast over radio station WRDW. The commanding officer of the hospital, Col. Hew B. McMurdo, M. C., introduced the speakers, including Brig. Gen. R. H. Mills of the dental corps, who represented the Surgeon General, and Col. Sanford W. French, chief of the medical branch of the Fourth Service Command, and Hon. W. D. Page, mayor of Augusta. The guest of honor was Mrs. Robert T. Oliver, widow of the late Colonel Oliver, in whose honor the hospital was named. Colonel Oliver was chief dental surgeon of the A. E. F. in the first world war, after which he was elected president of the American Dental Association. General Mills presented Mrs. Oliver with a miniature of the Oliver General Hospital flag and a replica of the "Stars and Stripes," which emblems flew together from a staff mounted on a silver base and were a gift from the personnel of the hospital. Following the exercises, Colonel and Mrs. McMurdo held a reception for the guests and others present. This 1,500 bed army hospital is fitted and equipped to carry out general surgery, general medicine and physical therapy. The list of medical officers on the staff of the Oliver General Hospital as of May 10 was as follows:

Col. Hew B. McMurdo, commanding officer
Col. George A. Stewart, chief of surgical service
Lieut. Col. Paul C. Carter, medical inspector

Lieut. Col. John F. Duckworth, executive officer
Lieut. Col. Arthur N. Ferguson, chief of medical service
Lieut. Col. Harold C. McDowell, orthopedics
Lieut. Col. Tyler, J. Walker, chief of dental service
Lieut. Col. Clifford C. Woods, assistant chief of surgical service
Major Samuel E. Bilik, chief of physical therapy
Major Isaac C. East, psychiatry
Major Southard T. Flynn, urologist
Major George Frumkes, chief of psychiatry
Major Grover E. Murphy, chief of eye, ear, nose and throat service
Major David H. Sprong Jr., surgical service
Capt. Gregory N. Brown, chief of laboratory service
Capt. Albert R. Buckelew, dental service
Capt. Joseph M. Cordi, orthopedics
Capt. Robert G. Diess, ophthalmology
Capt. Jack S. Goltman, gastroenterologist
Capt. Frank D. Hazlett, attending surgeon
Capt. Edwin F. Merolla, pediatrics
Capt. Louis T. McAloose, assistant urologist
Capt. Herman Rudensky, chief of chest service
Capt. Jack A. Rudolph, allergist and medical service
Capt. Hans Seidenmann, gynecology and obstetrics
Capt. James D. Wilson, chief of x-ray service
Capt. Eugene G. Wolff, anesthesia
1st Lieut. Abraham I. Beacher, cardiology
1st Lieut. Joseph A. Budetti, ear, nose and throat service
1st Lieut. Laurence B. Felmus, gynecology and obstetrics
1st Lieut. Victor J. Fimia, medical service
1st Lieut. Robert W. Gans, psychiatry
1st Lieut. Andrew E. Plahy, dental service
1st Lieut. Anthony Reiger, physical therapy

AVIATION MEDICAL EXAMINERS

A class of Aviation Medical Examiners graduated on April 22. The didactic portion of the course was conducted at the School of Aviation Medicine, Randolph Field, Texas, of which Brig Gen Eugen G Remartz, A U S, is commandant. The practical portion of the course was conducted at the three Army Air Forces classification centers. The list of graduates follows:

ALABAMA

James E Kendrick Jr, Major, Greenville
William C Kennedy, Captain, Florence

ARIZONA

Harold W Kohl Major, Tucson
Arthur G Nugent, 1st Lieut, Douglas

ARKANSAS

Joe W King 1st Lieut, Helena
Garland D Murphy Jr, 1st Lieut, El Dorado

CALIFORNIA

Clifford A Barber 1st Lieut, Rosemead
Joseph G Campbell Captain, Santa Barbara
Nathan E Carl 1st Lieut Los Angeles
Salvador Castaneda Major, Los Angeles
Walter H Drane Captain Los Angeles
John J Duncan 1st Lieut, Riverside
Alfred S Ehrlich 1st Lieut, Beverly Hills
Hyman Engelberg 1st Lieut Los Angeles
Dewitt W England 1st Lieut Orange
Bernard B Gadwood, 1st Lieut Oakland
Milton J Groat, 1st Lieut Menlo Park
Wilbur B Harbut 1st Lieut, Santa Monica
Kenneth B Jenkins 1st Lieut, Oakland (Piedmont)
Joseph E Kaiser 1st Lieut Santa Monica
Marshall Y Kremer 1st Lieut, Pasadena
Robert Lewis 1st Lieut Berkeley
Luther B Lowe 1st Lieut Crows Landing
Neil P McCloy 1st Lieut Los Angeles
John R Munger 1st Lieut Los Angeles
Maurice S Priver Captain Los Angeles
Layton S Rogers 1st Lieut Whittier
Warren N Steele Jr Captain Modesto
Avery E Sturm 1st Lieut, Yosemite National Park
Joseph F Walsh 1st Lieut Eureka

COLORADO

David R Akers 1st Lieut Erie
Carl B Ermshar 1st Lieut, Boulder
James G Espey Jr Captain Trinidad

CONNECTICUT

Edward A Abbey Major New Haven
Richard J LaVigne 1st Lieut Hartford
Ward J McFarland 1st Lieut, New Haven

DISTRICT OF COLUMBIA

Jack Bolterud Captain Washington
Joseph T Jana Jr Captain Washington
Frank S Pellegrini 1st Lieut Washington
G Victor Simpson Major, Washington

FLORIDA

Richard H Brooks 1st Lieut, Miami
William H Weems, 1st Lieut, West Palm Beach

GEORGIA

Ronald M Burnside 1st Lieut, Atlanta
Edwin W Turner, 1st Lieut, Emory University

IDAHO

Joseph E Baldeck Captain Lewiston
William R Jacob 1st Lieut, Lewiston
Reginald C Randall 1st Lieut, Kellogg

ILLINOIS

Hamford L Auten, 1st Lieut, Chicago
Edward S Baxter 1st Lieut, Western Springs
Isidore Brill 1st Lieut Champaign
James H Britton 1st Lieut, Voltaire
Herbert P Desheimer, 1st Lieut O Fallon
Joseph J Eckert 1st Lieut Chicago
Gilbert J Edwards Captain Pinckneyville
Walter Gaines 1st Lieut Chicago
Philip C Hemming 1st Lieut, Elgin
David S Koransky Captain Chicago
Herman B Lander Captain Chicago
Otis H Law 1st Lieut Pontiac
Alfred N Marshall 1st Lieut, Chicago
Clement J Michet Captain Chicago
John S Moffatt Major Rantoul
Joshua Oden Jr 1st Lieut Chicago
William E Rapp 1st Lieut Chicago
Vernon C Voltz 1st Lieut Rockford (Winnebago)
Frederick E Walker 1st Lieut, Chicago

INDIANA

George E Brown 1st Lieut Greenwood
Vance J Chattin 1st Lieut Washington
Marion M Crum 1st Lieut Angola
John M Engle 1st Lieut Portland
Asa H Fender 1st Lieut Worthington
Mars B Ferrell 1st Lieut Indianapolis
Joseph W Freeman Captain, Syracuse
James B Johnson 1st Lieut Greencastle
Leo Kammen 1st Lieut Indianapolis
Samuel A Manalan 1st Lieut Indianapolis
Charles C McLaugh Captain Pendleton
Robert A Nason 1st Lieut Garrett
Charles B Nabb Captain Valparaiso
Harold F Schuknecht Captain Michawaka
Ben J Siebenthal Captain Bloomington

Lowell C Smith Captain La Fayette (West La Fayette)
William R Tipton 1st Lieut, Greencastle
Ward B Warren, 1st Lieut, Indianapolis
Gerald S Young 1st Lieut Muncie

IOWA

Emmett A Doles, 1st Lieut, Clarion
Draper L Long 1st Lieut, Mason City
Seymour I Shapiro, 1st Lieut, Iowa City

KANSAS

Ernest A Cerv, 1st Lieut, Wichita
Fowler B Poling 1st Lieut, Halstead
Lyle B Putnam 1st Lieut, Wichita
Lee Emerson Reek 1st Lieut, Kansas City

REPORTED MISSING

Lieut Col William A Hutchinson, M C, who was in command of a hospital in Eritrea in Africa, left there a few weeks ago by plane en route to a new assignment. The plane was last heard from fifty minutes out of Cairo, when a violent storm was encountered. Immediate search failed to reveal any trace of the craft. Lieutenant Colonel Hutchinson graduated from Tulane University of Louisiana School of Medicine in 1924.

The U S Army has also reported missing in action since February 17 Capt Garrold H Nungester of the medical department, who at that time was serving in a North African sector. Captain Nungester was a native of Decatur, Ala, and graduated from Tulane University of Louisiana School of Medicine in 1933.

The U S Navy has reported as missing in action Lieut Felix B Long Jr, a native of Starkville, Miss. Lieutenant Long graduated from Tulane University of Louisiana School of Medicine in 1940.

PRISONERS OF WAR HELD BY THE JAPANESE

The War Department has informed the parents of Capt Joseph D VandeVelde of the medical corps that he is a prisoner of war of the Japanese in the Philippine Islands. Captain VandeVelde practiced medicine in Cleveland in 1937 until he entered the army in May 1941. He left for the Philippines the following August.

The parents of Capt Wilbert W Buckhold of Cleveland have been notified that their son is a prisoner of the Japanese. Captain Buckhold became a reserve officer in August 1940 and was stationed at Fort Knox, Kentucky, till late in 1941, when he was transferred to the U S Army Sternberg General Hospital in Manila.

The War Department has informed the mother of Capt Harold M Immerman, U S Army Medical Department and formerly of Saginaw, Mich, that her son is a prisoner of the Japanese government in the Philippine Islands. Captain Immerman entered the army medical department in February 1941 and after training in Texas and Pennsylvania was sent to the Philippine Islands.

NAVY

NEW METHOD OF MAKING SEA WATER DRINKABLE

The Navy Department announced on June 8 that a simple method of making sea water safe to drink has been perfected at the Naval Medical Research Institute, Bethesda, Md. The method, which appears to be more practical than any other yet devised, except distillation is intended primarily for use on rubber life rafts carried on air craft. The equipment consists of two chemical compounds and four plastic bags each having a capacity of slightly more than a quart. The survivor dissolves one of the chemical compounds in sea water contained in one of the bags, then pours the mixture into another bag that contains a filter sac. The product is emptied into the third bag and the first step is repeated except that the second chemical is used. After the chemical has acted the water is filtered in the fourth bag. Two of the four steps are eliminated if only two of the bags are used. In this case one container serves for dispersion and filtration of each chemical compound. By the new method of desalination, a survivor who started out with ten of the chemical packets in the necessary bags would be assured of a twenty day supply of drinking water. If there were five persons in the life boat, the supply would be enough for four days.

The composition and design of the bags are the result of several months of experimentation at the Naval Medical Research Institute. The process of removing sodium salts from sea water was discovered by Lieut. (jg) Claire R. Speelman, hospital volunteer specialist and further developed by Lieut. William V. Consolazio, hospital volunteer specialist chemist of the Naval Medical Research Institute and other members of the staff. Research was carried out under the direction of Capt. William L. Mann, M. C. medical officer in command of the Naval Medical Research Institute and Dr. A. C. Ivy, scientific director of the institute, and the new method was announced by Rear Admiral Ross T. McIntire, Surgeon General of the Navy.

BRANCH STOREHOUSES FOR MEDICAL DEPARTMENT

In order to facilitate the issuance of supplies for the medical department branch storehouses of the Brooklyn and San Francisco depots have been authorized. Storehouses under the control of the Brooklyn depot have been established at the U. S. Naval Hospital at Newport, R. I., the N. O. B. at Norfolk, Va., the U. S. Naval Hospital at Charleston, S. C., and the Naval Station New Orleans. Those under the control of the San Francisco depot are located at Pier 41, Seattle, San Pedro,

Calif., and San Diego, Calif. Medical storehouses established for overseas bases are intended to meet the needs of Naval forces operating in those areas, but large medical units and base hospitals, except when specifically authorized, should replenish their stores in the normal manner.

DENTAL REHABILITATION

Owing to the recent lowering of dental standards for enrollees, the Navy Department will undertake to rehabilitate, dentally, personnel requiring prosthetic dental replacements. At recruit training depots throughout the United States, laboratories will be established to carry out this extensive program. Many additional dental officers as well as enlisted personnel skilled in the field of prosthetic dentistry will be required. It is expected that additional building facilities will soon be erected to house these clinics and that present existing dental facilities at these centers will be expanded.

CONSULTANTS STUDY BATTLE CASUALTIES

Dr. Walter E. Dandy, professor of neurologic surgery at Johns Hopkins Hospital, Baltimore, and Dr. Meyer Wiener, professor of clinical ophthalmology at Washington University School of Medicine, St. Louis, both members of the Board of Honorary Consultants to the Surgeon General of the U. S. Navy, are on the West Coast observing battle casualties in the navy hospitals and appraising treatment methods. Dr. Dandy is accompanied by Capt. Winchell McK. Craig (MC) U. S. N. R., chief of the surgical service, Naval Hospital, Bethesda, Md.

SILVER STAR AWARDS

The Bureau of Medicine and Surgery announced on May 26 the Award of Silver Stars to Comdr. Emil J. Stelter and Lieut. Gerald H. McAteer, both of the Medical Corps of the Navy and former senior and junior medical officers respectively of the U. S. S. (aircraft carrier) *Hornet*, from which the Doolittle expedition bombed Tokyo and later was sunk in action in the Southwest Pacific area.

NEW NAVAL HOSPITAL

The Bureau of Medicine and Surgery of the U. S. Navy announced on June 7 that a new 400 bed naval hospital has been authorized to be established in Astoria, Ore.

MISCELLANEOUS

PHYSICIANS ON STRIKE IN THE NETHERLANDS

Reliable sources reported on April 28 that when a number of Dutch physicians were placed in detention for issuing certificates declaring patients physically unfit for guard duty ordered after sabotage had taken place, their colleagues went on strike. All doctors suspended office hours, accepted only urgent cases for treatment, referred accident cases to the municipal authorities, had their wives inform patients that interference on the part of the authorities prevented the doctors from rendering medical assistance, and asked physicians in neighboring towns not to take their places. The release of the arrested doctors followed quickly.

In another instance a doctor was imprisoned for refusing to violate the medical code by giving information about a patient to a spy. The other doctors in town immediately posted the following notice: "No consulting hours. A colleague has been imprisoned because he rightly refused to inform an unauthorized outsider about the illness of a patient. As long as this illegal detention lasts, other physicians cannot practice. The doctor was released within two days."

The physicians have warned the mayors that they held the authorities responsible for endangering public health, that they accepted the release of their colleagues as meaning that there would be no repetition of such arrests, and that if there were new arrests these would not have the slightest effect on their professional attitude. The doctors have also agreed not to fill out any forms, however innocent the source might appear, if these seemed likely to aid the authorities in collecting data about physicians.

The Stockholm *Svenska Dagbladet* reported that more than 4,000 physicians, or 97 per cent of the membership, stopped practicing rather than become members of the Dutch Nazi Physicians Chamber. When however dues for the organization were deducted from fees owed them by the health insurance funds, the physicians countered by refusing to perform any services for the funds. The German authorities answered by threatening to impose heavy fines on those failing to treat patients sent by the funds, but physicians removed their name plates and suspended all practice save for treatment of emergency cases. Eventually the authorities were compelled to allow the doctors to practice without membership in the Physicians Chamber.

In the March issue of a Netherlands underground paper, a physician described the attempts of German authorities to nazify the physicians.

"Soon after the occupation of the Netherlands German 'specialists' on organization of the medical profession were sent into the country to advise Dutch Nazis on use of existing medical societies as vehicles for infiltrating the profession with national socialist medical doctrines. The executive committee of the Netherlands Medical Society used every possible means to preserve the integrity of the organization, and when they realized that Nazi control could no longer be avoided, they resigned. Local branches of the society immediately declared their independence of the national organization, which consequently folded up. The Dutch Nazi Party then instituted a 'Physicians Chamber,' proclaiming every Dutch doctor automatically a member. The immediate reaction was that a number of prominent physicians contacted trusted colleagues throughout the country for the purpose of frustrating the Nazis' designs. Their first step was to send a letter to Reichs Commissioner Arthur Seyss-Inquart telling him that the medical profession would have no dealings with the Physicians Chamber or its works. The Germans proceeded with the organization of the chamber and declared every licensed practitioner a member. The chamber continues as more of an irritation than a functioning entity, as it is largely ignored by the physicians."

ESTABLISH NURSING SUPPLY AND DISTRIBUTION UNIT

A Nursing Supply and Distribution Unit has been established in the Placement Bureau of the War Manpower Commission. Chairman Paul A. McNutt announced on May 17. The new unit is designed to effect an equitable distribution of graduate nurses for military, governmental and essential civilian needs, somewhat as does the Procurement and Assignment Service for physicians, dentists, veterinarians and sanitary engineers. Establishment of the nursing unit under government auspices comes as a result of requests received from the nursing profession as represented by the National Nursing Council for War Service. The unit also has the approval of the Health and Medical Committee and the subcommittees on Nursing and Hospitals, Federal Security Agency. State and local Councils for War Service will be utilized for the operation of the unit. Quotas will be set up on national and state bases for the guidance of nurses in accepting service in military, governmental and essential civilian activities. Miss Katherine Tucker, director of the Department of Nursing Education, University of Pennsylvania, has been appointed chairman of an advisory committee to the Nursing Supply and Distribution Unit. Miss Alma C. Haupt, Washington, D. C., has been designated chief, and Miss Louise Baker, San Francisco, associate chief of the Nursing Supply and Distribution Unit.

PUBLIC HEALTH UNDER HITLER

According to *Novi List*, Sarajevo, Yugoslavia, of March 4 the Sarajevo municipality in conjunction with the German military authorities has issued the following health regulations. All travelers arriving at Sarajevo and sojourning there for more than twenty-four hours must be deloused and inoculated against typhus fever. Travelers arriving from Mostar will be deloused at the Alipasim refugee camp and may then continue to Sarajevo and beyond. Transit travelers from the directions of Brod and Visegrad southward beyond Bradina, and not sojourning at Sarajevo for over twenty-four hours, will receive a permit for the further journey from the German station officer at Sarajevo.

Reggeli Magyarorszag, Hungary, of March 6 states that anxiety has been caused in Hungary by the report of an unknown epidemic in Sweden of a disease which begins with a cold and sore throat and which is causing so many deaths that in certain districts (in Sweden) schools have been closed. It is also said that the symptoms resemble those of infantile paralysis. To reassure the public the reporter interviewed Prof. Dr.

Josef Tomsek, who says that so far there have been no reports in Hungary of anything resembling the Swedish epidemic. It is possible that even the Swedish epidemic is one of ordinary influenza accompanied by certain complications. The professor added that the influenza research department of the National Public Health Institute is ready to deal with the epidemic should it occur.

According to *Dagens Nyheter*, France, of February 7 the Vichy correspondent reports, in an article on the decrease in the powers of resistance of the French population, that tuberculosis of the lungs has increased by 30 per cent. The main cause is naturally undernourishment. Growing children in particular are endangered. A large number of young people, instead of increasing in weight, have decreased by 3 to 4 Kg. The weight of infants at birth is mostly well under normal.

Simultaneously with undernourishment, moral dangers threaten the life of the French population. The breaking up of the family, the returning prisoners of war and the refugees who have not returned to their homes have contributed toward a certain demoralization. The Red Cross has set up orphanages in Lyons, Marseilles, Nice and Toulouse, 12,000 children are in homes, 30,000 in unoccupied France and 80,000 in occupied France. Child mortality in 1940 was 91 per cent. At the same time 25,000 stillborn children were announced, a large percentage of these cases being due to syphilis. Over 110,000 of the children born this year were registered as orphans with out parents.

Paris-Soir of February 12 and 16 states that since the great food shortage, people are far more willing than ever before to undergo operations. This is noticeable in the hospital and also in private nursing homes. Today it is necessary to get one's name on a list a month or two before entering a hospital to reserve a place on the "table." An operation means fifteen to twenty days being waited on in comfortable surroundings. That is quite enough to induce people to part with some superfluous part of their anatomy which has been causing them discomfort for years. The actual operation is much more easily performed, as there are no thick layers of fat for the surgeon's knife to hew through. But there is a new difficulty: the accessories and instruments are beginning to run out. There are hardly any new towels and bandages, and there are few needles left for sewing the incision after the operation, they were made in Germany, those that are used in French hospitals today have been in use for three years and they are getting blunt. One surgeon stated that he had sewn up three or four thousand stomachs with one needle. As can well be imagined, nobody leaves lancets or clips inside the patients nowadays; they are far too precious to give to the patient to take away in his inside as a souvenir of his visit!

Besides diseases brought on because of food restrictions, skin disorders such as the itch are prevalent on account of the soap shortage. It happens all too often that sheets from hotel beds are merely swished through the water at the laundry, and the scabies "bugs" come back to the hotel again hungrier than ever after the bath they have had and that the hotel visitor does not get!

There are a distressing number of cases of consumption, and these are most frequent, not among children, but among adults between 50 and 60. They often have in their lungs lesions which are healed, the lack of milk, meat and fats has decalcified their scar tissue, and the bacilli have regained their virulence. They succumb to the disease after spreading the infection to those about them.

According to *Donauszeitung*, Greece, of February 11 vaccination against typhus has been made available to the inhabitants of Athens free of charge. The press made an appeal to the population, warmly recommending them in the interests of the community to avail themselves of the opportunity.

NPD, Germany, of March 31 reports the construction of a special apparatus by which it is possible to produce vitamin C from ordinary pine needles.

ORGANIZATION SECTION

PROCEEDINGS OF THE CHICAGO SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF THE
AMERICAN MEDICAL ASSOCIATION, HELD IN CHICAGO, JUNE 79, 1943

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 7

The House of Delegates convened in the Red Lacquer Room of the Palmer House and was called to order at 10 a m by the Speaker, Dr H H Shoulders

Preliminary Report of the Reference Committee on Credentials

A preliminary report of the Reference Committee on Credentials was submitted by the chairman, Dr G Henry Mundt, Illinois who reported that about one hundred and forty-four delegates with proper credentials had registered

Roll Call

A motion by Dr Allen H Bunce Georgia duly seconded, to dispense with the formal roll call and accept the registration of the delegates was carried

Dr Olin West, Secretary, announced that it would shortly be necessary to have a ballot, and the Speaker requested the Secretary to proceed with the roll call, after which the Secretary called the roll and announced that a quorum was present

Distinguished Service Award

Dr Roger I Lee Chairman of the Board of Trustees, presented a report of the Board as follows

The Committee on Distinguished Service Awards of the American Medical Association submitted five names to the Board of Trustees

In accordance with chapter VI, section 5, of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order, and presents a brief statement concerning each of them

Dr A J Carlson is a professor of physiology who for years has been an Associate Fellow of the American Medical Association Dr Carlson is widely known as a great teacher and the contributor of fundamental research in many aspects of medicine

Dr Elliott P Joslin is known throughout the world for his contributions to our knowledge of diabetes and for his educational contributions in this field for both the medical profession and the public He has participated in graduate education and is the author of several books of distinction

Dr Torald Sollmann is professor of pharmacology and has served as dean of the medical school of Western Reserve University at Cleveland Dr Sollmann has been a member of the Council on Pharmacy and Chemistry since it was first organized and has for many years been chairman of that body

On request of the Speaker Dr G Henry Mundt, Chairman stated that the Reference Committee on Credentials had registered 161 Delegates

The Speaker appointed as tellers Drs George A Woodhouse, Ohio Thomas F Thornton Iowa Walter A Howard Oklahoma J H Irwin Montana and James Q Graves Louisiana

The tellers spread the ballot and the Secretary announced that one hundred and forty-seven votes had been cast of which Dr Carlson received thirty seven Dr Joslin ninety-one and Dr Sollmann nineteen

The Speaker declared Dr Elliott P Joslin who had received a majority of the votes cast to be elected by the House of

Delegates to receive the Distinguished Service Award of the American Medical Association, and directed the Secretary to inform Dr Joslin of this action

Adoption of Minutes of Atlantic City Session

Dr E G Wood, Tennessee, moved that the House dispense with the reading of the minutes The Secretary called attention to the fact that Dr Arthur J Bedell, Section on Ophthalmology, had notified him that the name of Dr Bedell should not have been attached to the report of the Reference Committee on Sections and Section Work but that the name does so appear

On motion of Dr Arthur T McCormack Kentucky seconded by Dr H B Everett, Tennessee and carried the minutes were corrected to omit the name of Dr Bedell as a signer of the report of that committee

Dr Arthur J Bedell, Section on Ophthalmology moved that the proceedings of the Atlantic City Session of the House of Delegates as printed and distributed be adopted as amended The motion was seconded by Dr William R Brooksher, Arkansas and carried

Address of the Speaker, Dr H H Shoulders

The Vice Speaker, Dr R W Fouts Omaha presided while the Speaker, Dr H H Shoulders, read his address, which was referred to the Reference Committee on Reports of Officers

Mr Speaker Members of the House of Delegates and Guests

I wish, first to express to the members of the House my gratitude for the honor and privilege of addressing you again as your presiding officer and for your generous attitude toward my shortcomings

I have been led to believe that many if not a majority of the delegates wish to complete the work of this session at the earliest possible moment in order that all may return to urgent duties at home There is no doubt that urgent duties exist for every doctor at home and it is in sympathy with such a wish that my address will be brief

Notwithstanding all the circumstances of this session, it is the regular annual session of the House Business which is eligible for consideration by the House at any regular session is eligible of course for consideration at this session

It seems appropriate, at this time, to call to your attention a provision in chapter IV, section 4, of the By-Laws It reads as follows

SEC 4 TIME OF ELECTION.—The election of officers shall be the order of business of the House of Delegates immediately following the final supplementary reports of the Board of Trustees and Committees on the afternoon of the fourth day of the annual session or the House of Delegates (Thursday) provided however that the House of Delegates may change the time of election by action taken at least one day in advance of that to which the election is to be changed and provided further that the motion to change the time of election shall be supported by two thirds of the delegates registered

In this connection I would like to suggest to you the thought that no duty can be more urgent at this time than the duty of conducting the business of this session with all the deliberation necessary to enable the House to arrive at sound conclusions and take the appropriate actions The present it seems to me is no time for hasty or ill considered actions

There is one duty of the Speaker which I perform each year with a sense of dissatisfaction and regret It is the duty of appointing reference committees The By-Laws limit the number of reference committees to ten and the number of delegates on each reference committee to five except when the

House takes action to create additional committees. It is apparent, of course, that only fifty of the hundred and seventy-three members of the House can be appointed to a reference committee. My sense of dissatisfaction grows out of the conviction that the interest of each and every member would be stimulated by opportunity for service on a reference committee. My sense of regret grows out of the fact that I dislike so much to leave any member off of a reference committee.

It is a fact generally recognized that the reference committees perform a most vital function. Their work is arduous and difficult and too often made more difficult by the fact that delegates not serving on a committee attend the sessions of the Scientific Assembly instead of the hearings of one or more reference committees. This very attractive distraction is not present here this year, so I would like to suggest that all delegates who are free to do so attend as many reference committee hearings as possible. Such collaboration should make it possible for reference committees to make reports to the House so complete that little discussion from the floor will be required to establish a thorough understanding of the question and thus enable the House to act promptly.

The House is honored rather frequently by the presence of Fellows of the Association who are not eligible to the floor of the House. It should be understood by them that they are eligible to attend reference committee hearings and be heard if they wish to speak on a question under consideration by the committee.

The minutes of the House show that reference has often been made to the heavy responsibilities which rest on you as the delegated representatives of the entire profession of medicine in this nation. It seems to me that members of the House are fully conscious of their responsibilities. At the same time it is my impression that the importance of your duties and their relationship to the whole of medicine are not always fully appreciated by your constituents. I therefore would like to address myself to this question for a moment. Your functions, it seems to me, are those of a medical statesman. I use the word "statesman" in this connection as embracing all the attributes which distinguish a statesman from a politician, such qualities, for example, as broad knowledge, wisdom, vision, courage and loyalty to high principles. The politician, in the commonly accepted meaning of the term, possesses and exercises skill in the conduct of manipulations to accomplish his purposes without too much regard for their ultimate effects. American medicine has been blessed through the years by the benefits of a high order of medical statesmanship. It was medical statesmanship which wrote and adopted the Constitution and By-Laws of this organization which gave it a body. Wise statesmanship wrote and adopted the principles of ethics of our profession which gave it a soul. Medical statesmanship is responsible for all the actions taken to promote progress in medical education, public health, medical research and the adoption of higher requirements to practice, all of which add up to better medical care for the people. It was medical statesmanship which took all the actions necessary to make the services of the medical profession so available and so effective in the present war effort.

The ultimate effects of all these actions are being reflected in delightful news from every battle front to the effect that our soldiers, sailors and marines are getting the best medical care ever received by the soldiers of any nation at any time.

The quality of medical statesmanship which has been applied to medical problems in the past is entitled to a full measure of credit for the tremendous usefulness of medicine in our present day civilization whether in peace or in war.

As I visualize the future, many new problems will arise to challenge the statesmanship of medicine. In my opinion it occupies a place of importance second to none other in medicine today. The whole future of our profession will be determined not by research, however important its contributions may be, but by the character of the medical statesmanship which is brought to bear on these new problems as they arise. In conclusion, may I say to you that I know of no more trustworthy assurance as to the continued usefulness of medicine as

a science and an art and its continued attractiveness to men of noble intentions in the future, than the record of this House of Delegates in the important field of medical statesmanship.

In Memoriam

In accordance with the established custom of the House of Delegates of taking official notice of the death of Fellows who have served the Association in official capacities, either as members of the House or as Officers of the Association, the Speaker called the roll of those who had passed away since the House met in June of 1942, as follows:

(The dates following the names indicate years of service in the House or as officers of the Association.)

William P. Adamson, Florida, 1929
John B. Alcorn, Ohio, 1938, 1938, Special Session, 1940, 1942
John I. Brubhill, Indianapolis, Section on Laryngology, Otology and Rhinology, 1905, 1920
Sherman G. Bonney, Denver, Section on Hygiene and Sanitary Science, 1902
D. Chester Brown, Connecticut, 1907, 1914, 1916, 1918, Member, Board of Trustees, 1918, 1934
William L. Brown, Texas, 1911
Howard P. Collings, Arkansas, 1905
Guy L. Connor, Michigan, 1917, 1918, 1920
John I. D. Cook, South Dakota, 1920, 1930, 1932
Frank W. Cregor, Indiana, 1925, 1926, Section on Dermatology and Syphilology, 1929, 1934, Member, Judicial Council, 1923, 1933
George W. Crile, Cleveland, Third Vice President, 1907
J. Rihns Eastman, Indiana, 1912, 1915, 1917, 1919, 1922, 1924
Howard C. Frontz, Pennsylvania, 1930, 1939
David S. Funk, Pennsylvania, 1910
J. N. Grosvenor, South Dakota, 1931
Winfield Scott Hall, Chicago, Section on Pathology and Physiology, 1907
William M. Harshbarger, Illinois, 1905
Arthur D. Hirschfelder, Minneapolis, Section on Pharmacology and Therapeutics, 1919
Edward Jackson, Colorado, 1909, 1912, First Vice President, 1904
Robert W. Knox, Texas, 1904, 1905, 1908, 1927, 1928
Wilmer Krusen, Pennsylvania, 1917, 1919, 1921
Grant C. Madill, New York, 1912, 1913, 1922, 1935, 1937, 1938, Special Session, 1939, 1940
Ben R. McClellan, Ohio, 1911, 1913, 1914, 1916, 1917, 1919, 1923, 1925, 1941
Charles F. McComb, Minnesota, 1909, 1911
Clifton M. Miller, Virginia, 1912
John H. Peck, Iowa, 1921
Reuben Peterson, Michigan, 1907, Section on Obstetrics, Gynecology and Abdominal Surgery, 1919
Herbert A. Potts, Chicago, Section on Stomatology, 1924
John A. Robison, Illinois, 1912
Andrew C. Smith, Oregon, 1902, 1909, Second Vice President, 1906
Alfred B. Spalding, California, 1917, 1919, Section on Obstetrics, Gynecology and Abdominal Surgery, 1923
Smith A. Spilman, Iowa, 1926
Walter R. Steiner, Connecticut, 1919, 1925, 1927, 1929, 1933, 1936, 1940
Thomas Pinckney Waring, Georgia, 1906
Hubert Work, Colorado, 1906, 1907, 1909, 1913, Member, Judicial Council, 1911, 1916, Speaker, House of Delegates, 1916, 1920, President Elect, 1920, 1921, President, 1921, 1922

On motion, duly seconded and carried, the delegates arose and stood in silent tribute to the memory of the deceased delegates and officers.

Reference Committees

The Speaker, before announcing the personnel of the Reference Committees, asked and received permission, on motion of Dr. Arthur T. McCormack, Kentucky, seconded by Dr. Walter E. Vest, West Virginia, and carried, to name two additional reference committees, namely the Reference Committee on Executive Session and the Reference Committee on War Participation. The personnel of the Reference Committees as appointed by the Speaker is as follows:

SECTIONS AND SECTION WORK

Francis F. Borzell, Chairman, Pennsylvania
Benjamin F. Cook, Vermont
I. G. Christian, Michigan
Arthur J. Bedell, Section on Ophthalmology
Olin H. Weaver, Georgia

RULES AND ORDER OF BUSINESS

Raymond L. Zech, Chairman, Washington
George P. Johnston, Wyoming
Edward N. Ewer, California
E. N. Roberts, Idaho
A. A. Walker, Alabama

MEDICAL EDUCATION

Wilburt C. Davison, Chairman, North Carolina
Robert F. Schlueter, Missouri
Walter G. Pluppen, Massachusetts
Charles H. Phifer, Illinois
Leon J. Menville, Louisiana

LEGISLATION AND PUBLIC RELATIONS

Thomas A. McGoldrick, Chairman, New York
Lloyd Noland, Alabama
Edwin S. Hamilton, Illinois
Parke G. Smith, Ohio
William R. Melony, Jr., California

HYGIENE AND PUBLIC HEALTH

Warren F Draper Chairman	Don F Cameron Indiana
U S Public Health Service	Ransom D Bernard Iowa
Holman Taylor Texas	Walter W King Colorado

AMENDMENTS TO CONSTITUTION AND BY LAWS

Walter E Vest Chairman, West Virginia	Karl S J Hohlen Nebraska
E G Wood Tennessee	William Weston Section on Pediatrics
L A Buie Section on Gastro Enterology and Proctology	

REPORTS OF OFFICERS

Deering G Smith Chairman New Hampshire	Joseph H Cannon South Carolina
Floyd S Winslow New York	William R Brooksher, Arkansas
	Edward Jelks Florida

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Louis H Bauer Chairman New York	Andrew F McBride New Jersey
Robert A Peers California	W A Coventry Minnesota
	James R McVay Missouri

CREDENTIALS

G Henry Mundt Chairman Illinois	Alonso A Ross, Texas
J Newton Hunsberger, Pennsylvania	A P Nachtwey North Dakota
	Thomas M Brennan New York

MISCELLANEOUS BUSINESS

Charles G Strickland Chairman Pennsylvania	H A Luce Michigan
Albert A Gartner New York	James M Hayes Minnesota
	Stephen E Gavin Wisconsin

REAPPORTIONMENT

Arthur T McCormack Chairman Kentucky	Alfred T Cundry Maryland
L W Larson Section on Pathology and Physiology	William T Ramey North Carolina
	David D Scannell Massachusetts

EXECUTIVE SESSION

John H Fitzgibbon Chairman Oregon	Barney J Hein Ohio
Thomas P Murdock Connecticut	James P Wal' Mississippi
Lucius F Donohoe New Jersey	James C Sargent Wisconsin
	J F Hassig Kansas

WAR PARTICIPATION COMMITTEE

Stanley H Osborn Chairman Section on Preventive and Industrial Medicine and Public Health	Sam E Thompson Texas
Charles H Henninger Pennsylvania	Forrest J Pinkerton Hawaii
	Walter B Martin Virginia
	L B McAfee U S Army
	Harold W Smith U S Navy

SERGEANTS AT ARMS

John Z Brown Utah	Frank E Reeder (assistant) Michigan
Thomas A Foster (assistant) Maine	

TELLERS

George A Woodhouse Ohio	J H Irwin Montana
Thomas F Thornton Iowa	James Q Graves Louisiana
Walter A Howard Oklahoma	

Address of President Fred W Rankin

The Speaker resumed the chair and presented the President, Brig Gen Fred W Rankin, Lexington, Ky, who delivered the following address, which was referred to the Reference Committee on Reports of Officers

Mr Speaker and Members of the House of Delegates

The realization that I am about to relinquish the office of President of this Association prompts me to pass in review our record, crammed with exciting events, and to scan the horizon anxiously for gathering storms which may imperil our course and test further our courage and endurance. That we have kept a steady course set toward the maintenance of the health of the nation and its armed forces during these turbulent times of worldwide hostilities despite hurried preparation, bespeaks our Association's self-sacrificing devotion to duty and emphasizes its indomitable spirit and resolute determination—characteristics distinctly American. Never during its history or, for that matter during the history of our country, has there been the urgent demand which current exigencies have imposed on our special talents and skills. The rapid, thorough and efficient manner in which these demands were met has been due in great measure to the astute foresight of our leaders who, long before that fateful day when our enemies treacherously launched us into this holocaust, began careful preparations for the inevitable requirements which develop as a consequence of the military, industrial and continuing civilian needs for adequate medical care. That these plans were well contrived and intelligently executed is forcibly demonstrated by the continued improvement in the health of our nation and our armed forces despite the fact that about 40 per cent of the usable medical personnel of the country has entered the services, and the added burden

of a parallel gigantic industrial expansion that has been placed on the thinned ranks of the remaining civilian physicians. My deep gratification in reporting this thrilling and inspiring performance is heightened only by my humble respect and intense appreciation for the high honor you so generously bestowed on me as your President in this trying period, and for the distinct privilege of participating in these activities and in associating with the scrupulously sincere, assiduously attentive and particularly competent members of the Board of Trustees and the executive staff of this Association.

During the past year our country has been feverishly engaged in mobilizing and preparing its industries and manpower for war on a scale unprecedented in its history. All efforts have been directed toward a single fundamental purpose—the creation and preparation, as rapidly as possible, of a formidable military machine with irresistible striking power. This has required a national metamorphosis in which the medical profession has participated eagerly and wholeheartedly. Indeed, no other group has shouldered its responsibilities in this emergency with greater self abnegation, more cheerful enthusiasm and more efficient adaptability. On us devolved the obligation of establishing a bulwark against epidemic disease and military casualties, both on the home front and on the farflung battlefields of this globe-encompassing war. Essentially our function is concerned with the conservation and maintenance of health. That we have performed this function successfully is demonstrated by the fact that we have given our civilian workers production superiority in the rapidly expanding war-gear industries, and our armed forces combatant superiority in the jungles of Guadalcanal, on the gale swept North Atlantic and on the blistering deserts of North Africa.

The most difficult and exigent phase of the war, the rapid mobilization, has been expeditiously concluded. Now our paramount problems are concerned with logistics, production has been achieved. Consideration is already being given to post-war planning even though it may seem little warranted at this time. It should be realized, however, that only by such long range charting can the confusion and disorder which characterize immediate postwar reconstruction periods be averted. The manifold problems arising from these future developments will deeply concern and intimately affect us all. A rational solution of these problems depends on their thorough comprehension, but first they must be sighted as distantly and as clearly as possible. Accordingly we set a watchful gaze on the horizon.

It must now be apparent, even to those who have been most purlblindly recalcitrant, that mighty influences are at work to effect epochal changes in the complexion of medical practice. While it would appear that these influences have suddenly loomed on the medical scene it should be realized that they have long been forming and that the present military conflict has merely hurried their development and magnified their significance. That they can no longer be ignored seems difficult to controvert. We must face realistically these tremendously forceful socioeconomic trends which are intimately involved and deeply concerned with the nation's medical problems. The directional sign posts of postwar planning may now be clearly read by proposals already made for broadening the social security program and extending the nation's economic resources to assure "adequate medical and health care for all regardless of place of residence or income status." The complex connotations and inevitable implications of these plans and proposals make it quite apparent that the old system of medical practice will be considerably modified. If the limitless and baneful potentialities that can be projected into the science and art of the future of medicine are to be averted it becomes imperative in this transition period that the wise and tempered counsel of the medical profession exert its proper influence. That our medical descendants should look back and point a culpable finger to our page of history which would read that our actions were too little and too late is a plaguing thought. Our responsibility in approaching and participating in these evolutionary processes is greater than many of us have been willing to admit. Indeed it is intimately involved with the medical security of our country as well as of our profession. Have we so long basked in the luxuriating rays of medicine as the apotheosis of professions that we have become languid and inelastic in our

attitude and hesitant and fearful in our response to existing socioeconomic developments? I sincerely hope not.

Our motives are inherently sincere. They are based on desiderata to which we have held tenaciously and which we must guard assiduously lest future progress toward higher standards in medicine and professional tenets be jeopardized. Our ultimate objectives consist essentially in the provision of the best possible preventive measures against disease, the institution of the best possible forms of therapy and the ceaseless pursuit of advances and improvements in technical procedures and other prophylactic and therapeutic measures for clinical application. It requires no perceptive degree of rationalization to realize that the complete fulfillment of these objectives for the entire nation would necessitate the development of a comprehensive medical service.

It is becoming increasingly apparent that the trends now gathering momentum are directed toward some form of national health service as an integral function of the state. Proposals of this nature by governmental postwar planning agencies, both here and abroad, have been the subject of deep consideration, wide editorial comment and cogent discussion. This mood has been further reflected in recent comments by various medical and nonmedical writers who have penetrated with incisive clarity to the very heart of this controversial subject. It has been stated by some that the financing of this type of medical service is a socioeconomic consideration and not a medical problem. While it may be argued that financial provision for the institution of such a service is a function of the commonwealth, I am impelled to emphasize the fact that the structural character of the organization of any such type of health service is tremendously important to doctors and is vitally concerned with the execution of their professional function. This entire subject must be brought into sharp focus by the light of trenchant and dispassionate thought in order to observe both the desirable as well as the possible apprehensive aspects of the contemplated proposals.

In the national fulfillment of our altruistic objectives it must be recognized that two essential provisions are required, namely professional and financial facilities. It must also be recognized that the successful attainment of these objectives cannot be accomplished if in the implementation of any plan or proposal the professional facilities are subjugated to the authoritative management, traditionally dictated by political whimsy, of some legislative council controlling the financial provisions. These two provisions are interdependent and cannot be distinctly separated in approaching our objectives. The successful application of the former requires certain facilities supplied by the latter, which in turn can be guided intelligently only by professional knowledge. These vastly significant facts must be sincerely appreciated by all parties, both medical and nonmedical, concerned with this problem in their approach to its solution.

It is necessary to realize that the establishment of one of these contemplated medical services does not sound the death knell of private practice of medicine. These two forms of medical service are not incompatible, and their consideration must not be regarded in the light of apostasy but rather in the light of realism. They become incompatible only if in attempting their admixture certain undesirable ingredients are added. The problem is too difficult, the time is too short and the stakes are too high for all concerned to allow these factors to influence our actions. All efforts must be harmoniously combined and closely coordinated toward the elaboration of an intelligent program which will permit a democratic as well as a comprehensive medical service with equally high professional and ethical standards.

It should be clearly understood that this embraces the concept of existing freedom of thought and action in the exercise of our profession and our scientific pursuits. No one is more keenly aware, no one more fully cognizant than I, of the resultant stultification of the science and art of medicine which would be occasioned by any loss or curtailment of this freedom. Here is a principle which is more than a heritage; indeed, it forms the supporting foundation of the art of medicine and the guiding light of the science of medicine. It was freedom to think and freedom to express thought in speech and in writing unhampered by the fearful consequences of traditional or legislative authority that permitted medicine to progress to its present

exalted position in the field of science, and it is absolutely essential in its continued advancement. It is a principle, therefore, which we can never relinquish.

Since the challenges now confronting medicine will undoubtedly be multiplied as we approach the termination of this conflict and the commencement of the difficult reconstruction period, it becomes our responsibility and duty, with ever mounting importance and increasing urgency, to prepare to meet them now. In addition to the problems concerned with medical practice, we must be ready to meet the related problems of postwar rehabilitation of physicians—physicians whose entry into service involved personal sacrifices and the revamping of plans and ambitions, and whose return to civilian pursuits will necessitate numerous and variable readjustments and even resumption of specialized training.

These are prodigious tasks with manifold ramifications and far reaching significance, but tasks which we must face with unflinching resolve. Their achievement will demand not only sincerity of intent, integration of effort and clarity of thought but also active and close collaboration with appropriate governmental agencies. We cannot disregard the growing interest of the public, the government and various lay groups in the administration of medical care, nor can we afford to engage in a struggle for domination. The solution to these problems and the attainment of our objectives do not lie in that direction. They can be approached more expeditiously by a willingness to share their responsibilities and a readiness to cooperate in their consideration. The importance and urgency of these various problems commend the immediate establishment by this Association of suitable agencies for their investigation. In the institution of these agencies the purpose and vast significance of their function, the sharp delineation of their problems and the need for their collaboration with others should be emphasized. They must also be impressed with the importance of these studies and their resultant proposals on which so much depends. Indeed, the plan of action which we institute, the attitude which we manifest and the intelligence, zeal and judgment which we employ now in our efforts to solve these problems will greatly influence and actually determine the future standards of the medical service of our country and the cultural standards of our profession.

Address of President-Elect James E. Paullin

The Speaker presented the President-Elect, Dr. James E. Paullin, Atlanta, Ga., who delivered the following address, which was referred to the Reference Committee on Reports of Officers.

Mr. Speaker and Members of the House of Delegates

For the past ten years it has been my privilege to be associated with the official family of the American Medical Association as a member of the Council on Scientific Assembly, as a delegate, as a member of the Medical Preparedness Committee and now as your President-Elect. For the confidence bestowed in me by this body I am deeply grateful. As a member of the Committee on Medicine of the National Research Council and as a member of the Directing Board of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians I have had added opportunity to come in contact with the officers, and with practically all councils, bureaus and boards of this association. I seriously doubt if the members of the House of Delegates or of the American Medical Association realize the vast amount of work accomplished each year by the official bodies of this organization. Particularly have I been impressed with the amount of time and the earnest consideration devoted to the business of the Association by the Board of Trustees. Each member takes his work most seriously; I feel that the Association is under many obligations for the thoroughness with which they transact its business. I have noted with a great deal of satisfaction the contribution which representatives of the American Medical Association have made in a consultative capacity with numerous agencies of the federal government and with pleasure the tendency for all organizations interested in medical care at least to become trustful of one another and to be more willing to combine their efforts for the furtherance of medical care.

We are most fortunate in having the untiring and unselfish service of two valuable officials, who at all times and on all

occasions zealously guard the interests of this organization and constantly strive to increase its usefulness to the profession and to the public. I refer to Dr. Olin West, the Secretary and General Manager, and to Dr. Morris Fishbein, the Editor of THE JOURNAL. The war has placed on them extraordinary burdens which they have borne successfully, although not without hazard to their own health.

The creation of the Procurement and Assignment Service as a federal agency has been a great help in solving some of the problems arising as a result of the war and the withdrawal of physicians from civil practice. More frequent conferences between this agency and the War Participation Committee of the American Medical Association will be of benefit in helping to solve some of the problems created by the present emergency. The influence of such cooperation is evident in the effort being made by the Procurement and Assignment Service, together with the War Participation Committee and the United States Public Health Service to relocate physicians in areas of acute need for medical service in numerous areas of the United States. The suggestions adopted by this conference of investigating all reported areas of distress by state committees representing the medical profession, the Procurement and Assignment Service, the Public Health Service, the Office of Civilian Defense, industry and labor have been most effective in establishing essential requirements and in suggesting appropriate methods for the relief of these situations. Continuation of such a cordial relationship will become of increasing importance with the further withdrawal of physicians from civilian practice. It is suggested that the House of Delegates encourage the War Participation Committee to consult with other organizations that may be interested in the development of a program for the emergency care of civilian communities deprived of an adequate number of physicians.

Experience gained in 1936 when a survey of rural health conditions in Georgia was made by the United States Public Health Service in cooperation with the state medical association has convinced me that many problems of medical care for rural communities can be satisfactorily solved by the establishment of health centers placed at strategic areas in communities in great need of this type of service. The establishment of such centers will make hospital and nursing care available to a community and will supply for physicians the necessary facilities for the diagnosis and treatment of disease. This type of service is available now for communities in great distress if applied for through the United States Public Health Service or other federal agencies.

The Council on Medical Education and Hospitals of the American Medical Association is much interested in the plans of the federal government to establish special training courses for the enlisted personnel belonging to either the Army or the Navy. It has been necessary for the council to change certain recommendations without lowering the standards to make possible the accelerated medical training program. The lowering of the draft age to 18 years will bring other changes in the method of selection of premedical students and the distribution of students who may enter medical colleges. No provision has been made for the education of doctors to replace the casualties occurring in civilian practice. An agreement has been reached with the Surgeon Generals of the Army and Navy to allow approximately 1200 students, comprising women and those men physically disqualified for military duty to continue at their own expense the study of medicine. The 4500 other graduates will be used for replacement in the military services.

An increasing responsibility is felt for the continuation of medical education and postgraduate training to be made available to the men in the military service and to civilian physicians. This responsibility is accentuated because for the duration there will be no annual meetings of large national societies which furnished facilities for this type of instruction. To overcome this the Board of Trustees has appointed a Committee on Wartime Graduate Medical Training, which is sponsored by the American Medical Association, the American College of Surgeons and the American College of Physicians. Already this committee has secured a large group of nationally known consultants in various fields of medical activity and has established in twenty-four zones of the United States committees which

will receive requests for and sponsor programs to be submitted at various service hospitals for men on military duty in those particular areas. Such courses will be open to civilian physicians. Some thirty or more subjects have been listed from which each commanding officer of a given unit may choose those which he desires presented. Such a program has the approval of the Surgeon Generals of the Army and of the Navy and is offered to the Army through the surgeon of each service command and to the Navy through the commandant of each naval district. The response to such an undertaking has been most enthusiastic and remarkable. Programs are already being prepared for various installations and it is believed that by July 1 they will be in effect.

The officers and trustees of the American Medical Association have earnestly devoted themselves in recent years to advancement of the policies established by the House of Delegates in the field of social security. The diligence with which they have pursued this task has permitted the people of our country under the leadership of the medical profession to undertake the gradual development or modifications in medical practice leading toward the eventual establishment of plans distinctly our own. We face the postwar period without the restrictions of a state system of medicine, a federal or state system of compulsory sickness insurance or any of the other limitations on medical practice developed by governments abroad as a part of state control in medical care. By the exercise of American initiative we find between twelve and fifteen million Americans now insured voluntarily against the costs of hospitalization and many state and county medical societies, industrial organizations and private insurance companies engaged in extending protection against catastrophic illness. The initiative still rests with the people and with the medical profession in determining the kind of medical care that is to be provided in the future and in assuring the widest possible distribution of medical services to all the people. The importance of sound planning at this time for future developments cannot be over-emphasized. Under the leadership of American medicine all the agencies concerned should cooperate in formulating programs for redistribution of physicians in the postwar period, for the provision of hospitals and medical centers and for the establishment of methods for making available preventive, diagnostic and curative methods as they are developed. In such planning we should consider the obligation that we owe to ourselves and to the peoples of the countries now dominated by the Axis for the supply of needed medical personnel necessary for the rehabilitation of the sick and injured.

The American College of Physicians and the American College of Surgeons have appointed committees on the planning of postwar medical services. The Board of Trustees of the American Medical Association recognizing the importance of this work established a temporary committee to confer with these committees. A meeting recently held explored some of the problems relative to postwar medicine. It is anticipated that at least half of the members of the American Medical Association will be in the government services before the war ends. Many of these members will have been away from their practices for a period of years. The return of these physicians will present many difficult problems relating to those who have never engaged in the practice of medicine, some will desire new locations, others may desire refresher courses or postgraduate instruction, all will find a different world from the one they left.

It is recommended that the House of Delegates approve the action of the Board of Trustees in making plans to meet these problems and authorize the development of a permanent Committee on Planning of Postwar Medical Services to cooperate and collaborate with other agencies concerned with these problems.

There are other problems which will naturally arise during the consideration of many of these activities. It is my sincere belief that this body of physicians entrusted with the protection of the health and welfare of the citizens of our country will be able through its committees, councils, bureaus and boards to offer suggestions and to formulate procedures which will be of the greatest aid in helping to solve many of the problems that face us now and that will arise in the future. For these we must be prepared. American medicine today faces the greatest

opportunity ever offered our organization to make a lasting contribution to the betterment of the health of mankind and the establishment of an enduring peace

PRESENTATION AND ADDRESSES OF DISTINGUISHED GUESTS

Surg Gen Norman T Kirk, United States Army

Brig Gen Fred W Rankin, President, introduced the new Surgeon General of the United States Army, Dr Norman T Kirk, as follows:

Mr Speaker and Members of the House. On Tuesday, June 1, a new Surgeon General of the United States Army was installed. In selecting a man to fill this tremendously important post in these perilous times the Secretary of War and the Chief of Staff presented to the Commander in Chief of the Army the name of a surgeon whose prominent professional repute and extensive administrative experience in the Army, both in peace-time and in war particularly qualified him for the responsibilities of this office.

Since the Medical Corps is charged with the duty of preserving the health and maintaining the fighting strength of the Army at a peak level required to insure combat superiority, it is particularly fitting that one with unique professional talent should be chosen.

The new Surgeon General is an eminently qualified surgeon, as is attested by his membership in the elite surgical societies of this country as well as the exclusive international surgical societies. His peculiar aptitude for surgery of the extremities and for thoracic surgery and his numerous innovations and contributions to the surgical literature in these fields are well known to all of you.

I have particular pleasure as a former schoolmate of the Surgeon General to be permitted to present him and to testify not only to his extraordinary professional skill but also to his sturdy aggressive spirit, his assiduous industry and his innate integrity.

Gentlemen of the House I give you the Surgeon General of the Army Major General Norman T Kirk.

Major General Norman T Kirk addressed the House as follows: *Mr Chairman General Rankin Ladies and Gentlemen.* I feel it is probably a surprise for you to see me in this high office of Surgeon General. It was to me I was called to Washington and told that I was nominated for this high office, which I knew brought much honor with it and hard work. I am not used to the former but I am to the latter. I was also told I was going to North Africa immediately. I wasn't given a chance to say no to either. I couldn't have said no to the first because I wanted so much to go to Africa. So I thought it might be of interest to you to have a little story of what has been going on over there.

As you know, the Tunisian campaign has come to a successful conclusion. I happened to be about 5 miles out of Tunisia the morning the Germans unconditionally surrendered. The roads were so full of German prisoners in German trucks driven by German drivers and officers in officers' cars going to the rear that one could hardly proceed up those roads by motor. It was a wonderful sight to see.

I talked after this to General Eisenhower, the commanding general of the forces there, and to General Clark, the commanding general of the Fifth Army, and they both assured me that the outstanding thing that happened in that campaign was the services rendered by the Medical Department. This was done under trying conditions. In North Africa the distances are great. It isn't desert, where that fight went on mainly was north of the Atlas Mountains, with great hills and valleys, certain parts of which remind one of California as one drives through it.

You wouldn't believe it in Africa, but anti-freeze had to be put in the trucks to keep them from freezing last winter when this fight was going on. Our sick and our nurses and our personnel were living in tents under those conditions, and it was cold. In June I slept in a tent under five blankets with all my clothes on but my shoes and was cold then, so it was colder than that in May.

The distances were great there. It is 1,200 miles from the front to our Atlantic base to which our battle casualties had to be evacuated to be carried home by transport. Much of this would have been impossible had it not been for Air Corps evacuation. Airplanes that were used as freighters to a given

area 150 miles behind the line, back to the first base, carried some 13,000 battle casualties. These planes came up as freighters and then were fixed to carry 16 litter patients back to the first base sector.

The units forward did excellent work—the evacuation hospitals that were set up, and the clearing stations—and the death rate was unbelievably low. The death rate in these units, the evacuation hospitals, ran from 25 to 35 per cent. In the last war it ran around 15 per cent, if my memory is correct. Patients were transported back in excellent condition. Only 1 case of death occurred from gas gangrene. There were only 12 cases of gas gangrene, due to primary suturing and tight packing of wounds. Why this low mortality and this excellence of care of battle casualties? First, plasma, which had been made available to us through the Red Cross from volunteers at bleeding stations, the Army processing it and shipping it over there. Second, excellent technical care, proper surgery, supplemented by sulfonamide drugs. I am sure these are the things that helped to give us in this campaign the very low death rate.

In a check of infection before leaving there, there were recorded only 77 cases of osteomyelitis in the two base sectors for this campaign, which has extended since last November. I think you will agree that that is remarkable.

The general health of the command over there has been as good as at home, or better. The sick rate has been less than at home. The venereal rate has been high, particularly in Negro troops. It is getting under control. The malaria season is about to begin. The rains have just finished, they finished in May, a month late. It is always unusual weather anywhere one goes, it was unusual there. When the rains were active, the mud was ankle deep. Our nurses over there are working in coveralls and in the mud wearing general issue shoes that the men wear and wearing soldiers' heavy underclothes to keep warm in the winter months, and they are doing a wonderful job and delighted with it. The only nurses that were in trouble were those that were waiting to get on the job, and likewise the doctors. Unfortunately doctors—all of us—are used to doing something always, and this business of war irks them, their training at home, sitting around waiting to go, or after they are over if they are not actually engaged. In those evacuations they were working twenty hours a day. They refused the auxiliary groups set up, they didn't want them around, they didn't belong to them, they could do their own job. That was their attitude. So it has been a wonderful thing that the Medical Department has done in North Africa.

You would be surprised at the grain crops. Looking at this country as a country, the grain crops are everywhere. The red poppy is everywhere through the fields, it is beautiful. Mountain roads overlook beautiful valleys, but over those mountain roads ambulance drivers drove ambulances to get to evacuation hospitals, maybe 20, 30 miles, so tired they staggered as if drunk, filled up with coffee, and back on the ambulance to the front to get another load. Litter bearers in evacuation hospitals with blisters on their hands from carrying litters were still working.

One man came out to see me from the operating room who had served with me at Walter Reed. The surgeon apologized for his looks. He said "That man hasn't been to bed for two nights." That is the spirit of the men who are over there doing the job.

That is only a beginning of what needs to be done in further campaigns to come. We have scattered throughout the earth, in every country in the earth, Medical Department installations and personnel, except that part of the earth which belongs to the Axis. We are planning now for installations to go in there to take care of the civilian group after we take over. So eventually these Medical Department installations and personnel will be scattered through every country throughout the earth as soon as we take it over piece by piece from the Axis.

I want to thank this organization as a group and as individuals for the wonderful help and support they have given the Surgeon General and the Medical Department. Without it the job would have been impossible. I hope that I may have the same support. There will be times when things look as if they aren't going right, when too many doctors are sitting around doing nothing, and too many nurses, too many empty beds in hospitals, and this and that and the other thing, but it is going to be that way, it can't be any other. The doctor is like a fireman. The fireman sit around playing cards most of the time until they have to get busy. That is the doctor in war. We can't keep them all employed all the time. It there was a

way to give them a barbiturate and keep them quiet until we had to use them it would be fine

I think you for being able to appear before you this morning, and ask for your support and help and constructive criticism

George M. Morris, President of the American Bar Association

Dr West presented Mr. George M. Morris, President of the American Bar Association, who spoke as follows

Mr. Chairman and Ladies and Gentlemen I happen to be a member of the committee which reorganized the American Bar Association in 1936. At that time the American Bar Association instituted a House of Delegates, almost a direct adoption of the House of Delegates which has been so successfully conducted by the American Medical Association. I made a study not only of the constitutional background of this organization but of its statutory and its regulatory background and here I am today, a good deal like a boy who has read about a famous man never thinking he would meet him and suddenly stepping around the corner, meets the famous man whom he knows all about.

In connection with the formulation of our procedure and fundamental concepts in the American Bar Association the experience of the American Medical Association was an invaluable aid. It always seemed an anachronism to me but nevertheless it was true that here were the lawyers who would be expected to be the pioneers in a legislative group like this taking their lessons from their brother professionals the medics on how to do the job that the lawyers themselves ought to know how to do. It is a great compliment to the men who have had the management of the American Medical Association under hand for so many years that that particular thing should have taken place and we therefore I say on behalf of the American Bar Association, are greatly indebted to you for this example in helping us institute an agency which has meant more to the American Bar Association's successful functioning in its community effort than any single agency that has been brought into that Association in the twenty-one years I have known it.

I also may say that I think the bar is greatly indebted to the medical profession because of the contribution that organized medicine as distinguished from the individual physician and surgeon has made to the growing social consciousness of the organized bar. Organized medicine has blazed the way in this country for voluntary social contributions by organized groups. We are very happy in the American Bar Association to take advantage of the blazes that you have made along the trail.

I am very happy, Dr. West, to have had this opportunity of this introduction by you sir.

Mr. Speaker, I served as the first chairman for the House of Delegates for the American Bar Association for a term of two years. I know what it is to meet a speaker's schedule. I hope you will forgive me for interrupting yours. Thank you gentlemen.

Dr. T. C. Routley, Secretary, Canadian Medical Association

The Secretary introduced Dr. T. C. Routley, Secretary of the Canadian Medical Association who spoke as follows.

Mr. Speaker and my American Friends Once again it is my proud privilege and pleasure to bring you greetings from the medical profession of Canada. For twenty years this has been my joy and I can't tell you how stimulating how vitalizing how helpful you in your turn have been to us and I particularly want to pay tribute as I have on other occasions to that grand man of yours Olin West. When I realized that you were having but a business meeting and we on our side of the line are having the same I couldn't resist the temptation to come over here even for a day.

As I listened to that stimulating address of Major General Kirk which I am sure must have pleased you all I thought of the challenge which constantly stands before the medical profession.

You may have observed in one of our medical journals a recent statement, a composite bit of thinking I understand on the part of the psychiatrists and psychologists that man seeks three things: security, happiness and freedom from pain. Today we find a world gripped in the greatest war of all times a war for what? For security, happiness and freedom from pain. I wouldn't think Mr. Speaker it would require very much

imagination for any man of average intelligence to recognize that the victors who are going to secure security, happiness and freedom from pain must be the United Nations, because we find on the other side those who if they won would plunge the world into a sadistic state the like of which mankind has never heard of. So the challenge to the medical profession surely, Mr. Speaker, a challenge which has always existed, is being exemplified by your people in Africa today, because your people were there. We have it on the authority of the Surgeon General that the troops were able to do a better job and I venture to say they were happier and certainly because of you they must have had much freedom from pain.

When I think of the great American Medical Association and what you represent 150,000 to 175,000 doctors, and when I think of the possibilities that lie before you throughout the world and throughout the ages I am not envious, Mr. Chairman but I only hope that we in our small way in Canada only 12,000 strong may go along with you and that together we may emerge on that white horizon in the not too distant future where security and happiness and freedom from pain will be the lot of all men of good will.

I want to thank you most sincerely for receiving me here today.

REPORTS OF OFFICERS

Report of the Secretary

Dr. Olin West, Secretary, presented his report as printed in the Handbook which was referred to the Reference Committee on Reports of Board of Trustees and Secretary except the proposed amendment to the Constitution which was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Report of Board of Trustees

Dr. Roger I. Lee, Chairman, presented the report of the Board of Trustees as printed in the Handbook and the following supplementary reports of the Board of Trustees all of which was referred to the Reference Committee on Reports of Board of Trustees and Secretary with the exception of the reports of the Council on Industrial Health and the Bureau of Health Education which were referred to the Reference Committee on Hygiene and Public Health the report of the Bureau of Legal Medicine and Legislation which was referred to the Reference Committee on Legislation and Public Relations and the statement dealing with Participation in the War Effort, which was referred to the Reference Committee on War Participation.

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES

DECISION OF THE SUPREME COURT OF THE UNITED STATES

The decision of the Supreme Court of the United States in regard to the case involving the Medical Society or the District of Columbia and the American Medical Association was announced on Jan. 18, 1943 and was published in THE JOURNAL on January 23. On the advice of counsel a check for \$2,500 has been sent to pay the fine assessed by the District Court against the American Medical Association. Following further advice of counsel, analysis or interpretation of this decision has not been made.

The policies of the American Medical Association in the standardization of medical education, hospitals or other aspects of medical care are established by the House of Delegates. In the conduct of its defense in this case the Board of Trustees acted on the authority of the House of Delegates in each instance given unanimously.

RESIGNATION OF TREASURER HERMAN L. KRETSCHEMER

It is with a great deal of regret that as Chairman of the Board of Trustees I have to announce the resignation of Dr. Herman L. Kretschmer as Treasurer of the organization. Dr. Kretschmer tendered his resignation in a communication dated April 15. This communication came before the Board of Trustees at its meeting on Sunday, June 6, 1943 and was accepted with very deep regret. Dr. Kretschmer has served for ten years as the Treasurer of this Association. In addition to his services as Treasurer he has by his constant presence at all the meetings of the Board of Trustees given that Board the benefit of his wise and able counsel.

The Board of Trustees at its meeting on June 6, 1943 changed the Secretary and General Manager, Dr. Olin West, to carry on the duties of the Treasurer until the election of a new Treasurer by the House of Delegates.

COMMITTEE ON INTER-AMERICAN RELATIONS

The Association was highly honored at its annual session held in Atlantic City last year by the presence of a number of distinguished physicians from countries of South America and Central America and from Mexico, Cuba and Canada. The value of the scientific program presented at the Atlantic City session was greatly enhanced by the contributions made by several of these distinguished guests, and many new friendships were established. For the sake of the cause of scientific medicine in each of the countries of North and South America and in the interest of the promotion of friendly relations with the medical profession in all of them, the Board of Trustees recommends that a Committee on Inter-American Relations be created.

SUPERVISING THE HEALTH OF WOMEN IN INDUSTRY

At the 1942 annual session a resolution was adopted by the House of Delegates in which the Council on Industrial Health was requested to give consideration to preparation of a statement pertaining to the health of girls and women engaged particularly in war industries. In accordance with the provisions of this resolution and with further recommendations by the Board of Trustees, the Council on Industrial Health requested the Committee on the Health of Women in Industry of the Section on Obstetrics and Gynecology for suggestions concerning this problem. The committee prepared a report which was presented at the fifth Annual Congress on Industrial Health on Jan. 12, 1943 and was subsequently published in *FIVE JOURNAL*. Copies of this report have been widely distributed.

COMMITTEE TO STUDY AIR CONDITIONING

The Committee to Study Air Conditioning has submitted a report to the Board of Trustees concerning progress in the particular field with which the committee is concerned but has suggested that, because of the nature of existing conditions, the report be withheld from publication at this time.

COMMITTEE ON AMERICAN HEALTH RESORTS

Conditions created by the war have interfered materially with the work of the Committee on American Health Resorts, and it is probable that duties imposed on members of the committee, both military and civilian in nature, will impede progress until after the war has ended. Dr. W. Paul Holbrook, one of the original members of the committee, resigned because of his active military service. Dr. Euclid M. Smith is also engaged in military service but is continuing to serve as a member of the committee.

During the last year the rules of the committee have been thoroughly revised. Provision has been made for modification of existing rules when necessary so that health resorts included in the official lists of the committee may have reasonable opportunity to comply with modified rulings or voluntarily to withdraw from the listing. One rule provides that the advertising of health resorts shall not exploit the fact that the resort is listed by the Committee on American Health Resorts and that the fact of such listing shall not constitute the principal feature of publicity of any health resort. The revised rules now provide that listing of an institution on its first application shall be limited to a period of one year, that subsequent to that time listing shall be for three years, and that all listings shall be subject to prior review in event of violation of the committee's rules.

Work on the preparation of scientific papers on health resort therapy is being continued, although progress toward the completion of manuscripts is slow because many of those concerned as authors are on active duty with the military forces or have had to assume greatly increased responsibilities of other nature.

Nineteen health resorts have requested application forms, and the superintendent of Hot Springs National Park has asked for twenty forms for the institutions located in that area. Seven applications for the consideration of the committee have actually been filed. One institution which has applied for consideration has been taken over by the federal government, and one has

been closed for the duration of the war, while five applications are now under consideration by the committee. All of the five institutions concerned have been visited by inspectors of the Council on Medical Education and Hospitals. No acceptances for inclusion in the official list of the committee have yet been made.

At the last meeting of the Committee on American Health Resorts Dr. W. S. McClellan, who previously had served as acting chairman, was elected chairman of the committee.

SUPPLEMENTARY REPORT OF THE BOARD OF TRUSTEES DEALING WITH HOSPITAL CORPORATIONS ENGAGING IN THE PRACTICE OF MEDICINE

The subject matter covered in this report is contained in three resolutions submitted to the House of Delegates as follows:

- 1 The resolutions introduced at the Atlantic City session in 1942 by Dr. E. H. Skinner, Section on Radiology.
- 2 The resolutions introduced by Dr. Harry H. Wilson, California, at the Cleveland session in 1941.
- 3 The resolutions introduced by Dr. Lyell C. Kinney, California, at the Atlantic City session in 1942.

The Skinner resolutions assert that group hospitalization plans continue to include certain medical services contrary to the expressed policies of the House of Delegates, that such practice puts corporations into the practice of medicine, that they inject a third party into the personal relationship between the physician and the patient, and that hospitals should not be permitted to practice medicine through the medium of employed physicians or enter into a contract to furnish such services. To correct this situation the resolutions ask that, when professional services are rendered under such conditions, the physician's fee be collected by or on the account of the physician, that the physician's bill be sent directly to the patient served and that hospital services be defined so as to limit them to bed, board, operating room services, medicine, surgical dressings and general nursing care.

The reference committee to which these resolutions were referred recommended the adoption of the resolutions but stated that it saw no new principles not already accepted by the House. It concurred in the necessity for clarification of the existing relations between physicians and hospitals.

The Wilson resolutions, stated briefly, asserted that it was of primary importance that prepayment and other nonprofit organizations make clear the differentiation between medical and hospital services so that the physician-patient relationship of the pathologist, the radiologist and the anesthetist may be preserved. It is recognized in the resolutions that difficulties exist because of the apparent necessity of setting up plans to cover low income groups and it is asked that the House of Delegates instruct the Board of Trustees to appoint a committee to confer with committees of the national hospital associations for the purpose of working out and submitting reports to their respective organizations designed to clarify the situation, that the Board of Trustees proceed as expeditiously as possible and that any agreements arrived at be submitted to the next session of the House of Delegates and in the interval the respective agencies involved be advised of the tentative agreements.

The reference committee reporting on these resolutions approved the first portion asking for the appointment of a committee to confer with the national hospital associations in an effort to set up platforms or principles that would clarify the relations between the groups involved and stated with regard to the second portion of the resolutions, which was emphatically approved, that it found that much investigation would be necessary which might overtax the administrative personnel of the Association because of the medical preparedness program in connection with the war effort. With regard to the third part of the resolutions, the reference committee advised that pathologists, roentgenologists and anesthetists be requested to refrain from entering into contractual relations with hospitals until the matters under consideration could be clarified.

The Kinney resolutions assert that a dangerous situation exists, to wit, that certain insurance companies covering hospital and health insurance schemes pay for medical services billed under the misnomer of hospital services. It is feared, continues the resolutions, that this abuse will lead to further inclusion of the physician's services in hospital bills, and requests

that the House of Delegates ask the insurance companies to cooperate with the medical profession, to pay for medical services only on the receipt of bills for such by physicians rendering the service, and asks that physicians in turn cooperate by seeing to it that professional charges and hospital charges are clearly separated.

The reference committee reporting on these resolutions said that it did not recommend passage of the resolutions in their present form, since it felt that there were difficulties involved which would require much investigation to get the facts and that delicate negotiations would be required, and referred the matter to the Board of Trustees for study, for the weighing of the feasibility and scope of procedure and for ways and means of accomplishing the desired result.

COMMENT

In reviewing these resolutions, it becomes apparent that all the questions involved in the same or similar form have previously been considered and acted on by the House of Delegates. By way of example the reference committee, handling a resolution on the administration of anesthetics introduced in the 1937 session, said in substance "Your reference committee believes that in principle the administration of anesthetics, the interpretation of roentgenograms, the interpretation of laboratory findings and the application of physical therapy measures constitute the practice of medicine and should be confined to those who are licensed practitioners of medicine. However, your reference committee believes also that in practice it is at present inexpedient to urge the enforcement of the provisions of this resolution."

Again at the 1937 session reporting on resolutions involving group hospitalization, the reference committee stated "Your reference committee would refer to the report of the Board of Trustees, page 22, principle 4, which was adopted by this House of Delegates. In that paragraph the limitations of hospital service are well defined. Your reference committee reaffirms this definition of hospital care and recommends its application to contracts for group hospitalization. In regard to certain benefits offered by many hospital insurance plans, combining professional and technical services, your reference committee is in complete sympathy with those who would make every possible provision to prevent inclusion of any and all types of service involving medical care."

Reporting at the 1936 session on resolutions concerning the practice of medicine by hospitals through the agency of employed physicians the reference committee stated "the principle enunciated by the House of Delegates at Cleveland in 1934, 'that the practice of radiology, whether for diagnostic or therapeutic purposes, constitutes in fact the practice of medicine' and recommended that 'all services connected with the practice of radiology be under the direct control and supervision of the medical profession and this same principle pertains to other technical and professional services'."

Concerning the ethical consideration involved in these resolutions the Judicial Council of the Association has made certain pertinent observations. For instance in the Council's report in 1929 it stated "The American Medical Association cannot control legislation or the administration of law. The remedy must be sought at the hands of legislatures in the several states and it would seem to be the responsibility of the constituent state association to instigate measures seeking relief if the initiative to that end is not taken by the law makers and the administrative officers of the state."

Reporting at the 1930 session, the Council stated "The development of industrial medicine, the activities of corporations in medical fields the expansion of public health programs especially those of unofficial agencies the organization of so called hospital associations and cooperative diagnostic laboratories the creation of funds and foundations concerned in some manner with medical practice or public health the workings of compensation laws and many other factors have given rise to many new questions and have produced many perplexing problems of which final solution is not easily possible. To all of these coming to its attention the Council is giving earnest consideration and is attempting to be helpful in devising plans of action that will safeguard the integrity of the medical profession and contribute to the public welfare."

At the 1941 session under the heading of 'Principles, Not Laws' the Council states "Furthermore, the membership of the Council, even though spread over the United States from New York to Washington and from Ohio to Texas, cannot be familiar with local laws, customs and needs, all of which must be taken into consideration in an interpretation of the Principles as applied to a specific situation. The Principles of Medical Ethics of the American Medical Association in all its statements is based on and covered by the first section, namely, 'A profession has for its prime object the service it can render to humanity, reward or financial gain should be a subordinate consideration'."

The principle is the same in all sections of the country, but what may be ethical in one place may be unethical in another as the result of different laws different customs different needs of the people. The Judicial Council cannot have knowledge of all these. Each constituent state medical association should have the knowledge in its own state which the Judicial Council lacks, and many of the inquiries coming to the Council should have been addressed to the state associations, the officers of which, because of proximity, are better qualified to advise." In the same report this Council continues "it cannot be said too often that these principles are not laws to govern but are principles to guide to correct conduct."

It would thus appear that such questions as the patient-physician relationship the corporate practice of medicine, the separation of medical from hospital services in group hospitalization contracts, have been, as illustrated, repeatedly considered and acted on by the House of Delegates. These actions stand now as before, as expressions of principle. But, since local conditions with regard to accepted local practices, economic conditions, availability of qualified specialists in certain fields and public and professional attitudes vary widely, the difficulty arises in the practical application of the principles involved to the problems to be solved. The truth is that our code of ethics and our laws as approved by the House of Delegates governing our relationship to the public and to one another are as the Judicial Council has stated, more in the nature of principles than ironclad blueprints. A moment's reflection will suggest the wisdom of such standards. Conditions and circumstances surrounding a given question vary widely in different jurisdictions. Circumstances may lead to the adoption or a course of action as just in one section, whereas the absence of such conditions would veto a similar course in another. When it is borne in mind that it is to public interest that medicine everywhere is primarily intended to serve, it becomes apparent that no rules of conduct or standards of procedure that are in conflict with such primary intent could with consistency be maintained. It is because medicine accepts this arrangement and urges its faithful application that our governing bodies, state and national have always refrained from inflexible enunciations. Reduced to its essence, medical organizations in this country are in spirit and in fact decentralized with the responsibility placed where it belongs—on the state and county medical society level. Only general principles are enunciated by the national body, and these as just stated are subject to modification when in the judgment of a constituent society local conditions require it. The crux of the question can be stated in another way, namely that the supreme aim of medicine and all its pronouncements ethics and guiding principles is to furnish a high quality of medical service to all the people regardless of economic status.

On the other hand in our effort to avoid the exploitation or either the public or the profession we must ever be watchful lest the privilege of definitive action accorded state and county societies be not used as license for the popularization or abuses. Where such already exists local societies should act. They have the implements for such action and no new pronouncements are necessary. It is true that we have learned in these troublesome times that the destroyers of the nation's institutions work silently by methods now popularly known as infiltration tactics. The guardians of the people's liberties and their institutions such as free medical practice, must have their initiative whetted and their sense of observation sharpened by constant awareness. The presentation in the House of Delegates of such resolutions as are now under consideration are timely and commendable. They reemphasize the necessity for eternal vigilance.

CONCLUSIONS

1 In the solution of a given issue, whether concerned with exploitation of the physician or with exploitation of the patient, actual facts must be established and local conditions must be understood before the adjudicating body can act. Constituent associations and component societies are in a better position than are the national bodies to obtain and to act on these cardinal necessities.

2 Conditions vary widely in the respective jurisdictions requiring the weighing of circumstances before the letter of the principle or the approved action of the House of Delegates can be equitably applied.

3 The local society is better able than is the national body to do justice to a situation that is colored by so many factors.

4 No new principles are involved in the resolutions under consideration, and no new pronouncements would appear to be necessary.

5 The responsibility for the correction of abuses rests primarily on component county medical societies and constituent state or territorial medical associations empowered to govern themselves in local matters, while they may reasonably be expected to abide by the authority of the House of Delegates in matters of general policy.

6 The obligation to prevent the exploitation of the patient while protecting the prerogatives of the physician bears with equal responsibility on our profession.

7 Special societies are in position to help in the equitable solution of these urgent problems by securing the understanding and cooperation of their members. Attempts to devise remedial measures at the national level would appear to be unwise.

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES DEALING
WITH PROGRESS REPORT OF THE COMMITTEE TO STUDY
THE RELATIONSHIP OF MEDICINE AND LAW

In accordance with the provisions of the resolution submitted to the House of Delegates at the Cleveland session in 1941 by Dr. Walter G. Plimpen, delegate from Massachusetts, a Committee to Study the Relationship of Medicine and Law was appointed in January 1942 by the Board of Trustees. The committee consisted of Dr. Edward R. Cumiff, Mr. J. W. Holloway Jr., Dr. Harrison S. Martland and Dr. Alan R. Moritz, Chairman.

The first meeting of the committee was held on Jan. 24, 1942 and was attended by Prof. Rollin M. Perkins and Mr. Louis S. Colanic representing the committee of the American Bar Association designated to collaborate with the committee of the American Medical Association.

As a result of an exhaustive discussion of the scope of the assignment, it was decided that of the various relations that exist between medicine and law no activities are more important than those closely integrated medical and legal activities that have as their common purpose the investigation of deaths in the interests of justice and public safety. It was decided to divide the problem into three major components, each of which was assigned to a subcommittee for study and investigation pending the next meeting of the committee. One of these was to define the medical desiderata of such a public service. Another was to define the legal desiderata. The third was to survey the various types of coroner and medical examiner systems now operating in the United States in order to determine in what respects they conform to or fall short of the optimal scientific and legal objectives.

The second meeting of the committee was held on Aug. 15, 1942, at which time the various subcommittee reports were presented and discussed. At the request of the committee, Dr. Timothy Leary and Dr. Thomas A. Gonzales attended the meeting and participated in the discussion. The Chairman was instructed to prepare from the findings of the subcommittees a provisional report for submission to the committee of the American Bar Association for criticism. Such a provisional report was prepared and sent to the various committeemen as well as to the members of the corresponding committee of the American Bar Association.

Since August 1942 various criticisms and suggestions have been made for improving the preliminary report. One was

that a survey should be made of the relative costs of operating coroner and medical examiner offices in urban and rural districts. Another was that the committee should draw up various types of model legislation for the improvement of coroners' or medical examiners' offices. At the present time both of these latter projects are being undertaken. Letters of inquiry and questionnaires have been sent to a large number of county treasurers, coroners and medical examiners and to various federal, state and college bureaus concerned with studying the costs of county government. Several months will probably be required for the acquisition of sufficiently complete information to permit the completion of a final report.

During the past year legislation designed to replace the office of county coroner with that of medical examiner has been introduced in three states. In two of these, members of this committee have been actively concerned in an advisory capacity.

It is the intent of the committee to submit a final report of its activities to the Board of Trustees at some time during 1943.

Respectfully submitted,

ALAN R. MORITZ, Chairman

SUPPLEMENTARY REPORT OF BOARD OF TRUSTEES DEALING
WITH REPORT OF PROCEEDINGS OF THE JOINT COM-
MITTEE MEETING OF NATIONAL HOSPITAL ASSO-
CIATIONS AND REPRESENTATIVES OF THE
BOARD OF TRUSTEES OF THE AMER-
ICAN MEDICAL ASSOCIATION

FACTUAL DATA FROM CONFERENCES

In compliance with the resolution of the House of Delegates which directed the Trustees to "explore" and "clarify" the relationship of medical service in hospitals, the following report is submitted.

In the past three years the Board of Trustees of the American Medical Association has had repeated conferences with the hospital associations and with representatives of groups representing special activities in medicine including pathologists and radiologists. On Dec. 19, 1941 representatives of the laboratory groups of chemistry and of pathology met with the Executive Committee of the Board of Trustees. On Nov. 19, 1942 representatives of the three hospital associations met with the Board. Present at this conference were Edgar Blake Jr., Rev. Joseph A. George and Mr. Albert G. Hahn, American Protestant Hospital Association; Rt. Rev. Mons. Maurice F. Griffin, Dr. James A. Hamilton, Dr. Robin C. Buerki, Mr. Frank J. Walter and Dr. Bert W. Caldwell, American Hospital Association; and Rev. Alphonse M. Schwitalla, Rev. John W. Barrett and Mr. M. R. Kneiss, Catholic Hospital Association. Dr. Herman G. Weiskotten represented the Council on Medical Education and Hospitals. Lieut. Col. Harold C. Lueth, the liaison officer of the Surgeon General's Office, also was present. The national hospital conferees represented the joint committee of the three hospital associations. At this meeting problems of technicians in the several activities of the hospitals and the fundamental principles of medical practice, as well as the inclusion of medical services in hospital contracts, were discussed. The discussions as to hospitals and medical practice, through the emphasis of the resolution of June 1942, were focused on radiology, but it was repeatedly pointed out that the problem is broader and concerns the relationship and customs of practice which have grown up over the years as laboratory procedures and, more particularly, radiology have come to occupy a more and more important place in the procedures and finances of hospitals.

At the conclusion of this conference of November 19 it was agreed that a further conference be held by a subcommittee appointed by the Chairman of the Board, to explore further the relationships of hospitals to medical practice.

The following committee was appointed: James Hamilton, Chairman, and Bert W. Caldwell, American Hospital Association; Father A. M. Schwitalla, Catholic Hospital Association; Edgar Blake, Protestant Hospital Association; and R. L. Sensenich and E. E. Irons, Trustees of the American Medical Association.

Mr. Hamilton later indicated that he would not be present, and Dr. R. C. Buerki was appointed by him, in his place. Dr. Buerki served as chairman of the committee. This committee and Dr. Olin West, Secretary of the American Medical

Association met on Sunday, April 11, 1943 together with representatives of the American College of Radiology L S Gouin W Archer, W E Chamberlain F J O'Brien E L Jenkinson Fay Squire, B R Kirklin Dr Stone and Mr Mac F Cahal

Toward the conclusion of the sessions of this subcommittee at which the views of radiologists and of hospitals were stated there was discussion as to who should write a report and to whom it should be sent It was pointed out that this group is a subcommittee of the conference committee consisting of the Joint Committee of the Hospitals and the Board of Trustees of the American Medical Association Owing to the divergence of views as expressed by radiologists and hospital conferees it was evident that an agreed report could not be formulated

The hospital associations indicated that at least two of them would hold annual meetings after the week of June 7 1943 It was also pointed out that the hospital members of this subcommittee were appointed through the Joint Hospital Association committee and not by the individual hospital associations, and that hence any report should go to the Joint Committee They also preferred to have a report come to them for presentation to their associations In order that progress might be made without further delay it was agreed that the report would be made by the representatives of the Trustees of the American Medical Association for submission to the Board of Trustees and through them to the House of Delegates and to the three hospital associations

In addition to certain general broader considerations of medical practice such as the increasing activities of technicians in various laboratory procedures and the practice of anesthesias pathology, and so on it concerns chiefly a factual report of views expressed in the conference of Sunday April 11 1943 by representatives of radiology and of the hospital associations initiated by the Board to explore and clarify the relationship of medical and hospital practice

It will appear that present practices have grown up over the years with the development of more and more laboratory procedures in hospitals, the introduction of more specialized subgroups in medicine and the organization of various forms of group and individual hospital insurance plans

The resolutions of the House of Delegates of June 1942 were read as follows

WHEREAS The House of Delegates approved a resolution introduced by Dr Harry H Wilson at the 1941 session instructing the Board of Trustees of the American Medical Association to confer with similar committees representing the American Hospital Association and the Catholic Hospital Association of the United States the joint committees to study and submit reports to their respective national bodies in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in prepayment hospitalization and similar plans the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association and

WHEREAS The Board of Trustees was requested in the same resolutions to proceed to these matters as expeditiously as may be possible and

WHEREAS Evidence of continued encroachment of hospitals into the practice of medicine is manifest in numerous group hospitalization plans which offer certain medical services on a service basis as a part of hospital care and in plans adopted by numerous hospitals which include certain medical services in an all inclusive per diem rate for hospital care now therefore be it

Resolved That the House of Delegates reaffirms the principles enunciated in official resolutions over a period of many years opposing the practice of medicine by corporations or the interjection of a third party into the personal relationship and financial transaction between doctors and patients and be it further

Resolved That hospital corporations should not be permitted to engage in the practice of medicine through the medium of employed physicians or to enter into contracts with any individual group or agency whereby the hospital agrees to furnish any medical services and be it further

Resolved That to the end that hospitals be discouraged from offering services of licensed physicians to patients on a contract or service basis all fees for medical services rendered in hospitals should be collected by or on account of the physician rendering such service and all physicians concerned in the care of a patient should give or send directly to the patient or other responsible party a statement showing charges for professional services rendered provided however that an exception to the foregoing principle may be made in the case of a formally organized partnership of physicians which acts in the capacity of an individual and be it further

Resolved That the definitions of medical service and hospital service as applied to the principles stated herein shall be consistent with those applied in previous declarations of the House of Delegates in which

medical services are construed as the services rendered by licensed practitioners of medicine and hospital service as limited to hospital accommodations such as bed operation room medicines surgical dressings and general nursing care and be it further

Resolved That the Board of Trustees be urged to proceed to the clarification of these problems as requested by the House of Delegates at its last annual session

It was pointed out that at the conference in December 1942 the agenda called for consideration in addition to radiologic relationship to hospitals of the effects of increasing lay influence in hospital practice by technicians in pathology, physical therapy etc and that gradually attention became focused on radiology (under the foregoing resolutions) as symptomatic of a number of other situations in which the same principles are involved

Radiology is a department of medicine and the practice of radiology is the practice of medicine

This principle is accepted by hospitals

This principle does not seem to be carried out in practice when hospitals include radiologic services in a comprehensive hospital insurance rate plan

The House of Delegates has defined hospital care and this definition does not include radiology and other medical practice

During the discussions, the following facts and suggestions were developed

However, a patient enters a hospital requires radiologic service The hospital is responsible for the machinery, for technicians, etc, and at the same time may pay the radiologists salary

Where is the line of technical and professional service to be drawn?

One solution would be to treat radiology like surgery Charge operating room and anesthetic fee, etc The surgeon sends his own bill Likewise the radiologist might send his own bill but if so then he should give up his salary The hospitals maintain that by accepting a salary (and often this is not a small one) the radiologist gives up the right to send his bill

Salaries of Radiologists—One summarization of the radiologists of the radiologist-hospital relationship was as follows

1 Radiology is practice of medicine

2 Blue Cross plans should not include medical service

3 It was assumed that all radiologists are more or less in agreement in opposition to the general principle of a salary arrangement between radiologists and hospitals

The enforcement of the salary matter must be cooperative

There was no agreement to the statement as to salary It was believed by some who were present that a salary arrangement could be satisfactory

Still another radiologist maintained that salary arrangement is satisfactory provided the hospital does not profit from the operation of the x-ray department

The disposition of hospital profits from x-ray departments was discussed and it was noted that in some hospitals x-ray profits are used only for further development of the x-ray department In other hospitals profits from x-ray service are used in other departments

X-Ray Charges and the Cost of Medical Care—X-ray charges constitute a considerable fraction of the patient's hospital bill

It was stated that the high charges by hospitals for x-ray work are maintained because they do not wish to compete with the radiologist in his downtown office Owing to large volume hospitals might well reduce their charges

It was stated that one state association of radiologists had sent its official charges to the hospitals with the idea that no hospital should charge less than that

Radiology and Treatment—Most of the discussion concerned x-ray service in diagnosis

It was pointed out that many of the difficulties had arisen as a part of radiologic diagnosis

Radiologic therapy requires the direct attention of the radiologist and yet the hospital treats x-ray diagnosis and therapy on the same basis and bills the patient for both

The discussion returned to the question as to whether hospitals can properly include radiology admittedly the practice of

medicine, is a hospital benefit in insurance plans. It was maintained that the hospitals should not hire the radiologist.

The following statement was presented as a solution by one of the conferees: "This committee recommends that all radiologists give up their salaried positions and that no hospital in good standing will be approved by the American Medical Association that hires its radiologist."

One of the radiologists present stated that he had no right to endorse any such plan but that he thought that radiologists would do so if the hospitals would agree. Regret was expressed that the radiologists do not have a degree of control over their membership which could enforce such a plan, and that the same is true with respect to hospital groups. It was also noted that American Medical Association approval of hospitals concerns educational matters only.

In the discussion that followed it was pointed out that neither the radiologists nor pathologists nor other groups have observed the principle under discussion.

The American Medical Association cannot settle the difficulty unless the members in these various groups will themselves live up to the principle. Men in special fields who have connections with hospitals whereby they are paid salaries or commissions and the hospitals furnish machinery and apparatus, have stated that if they are compelled to observe the principle for which the American Medical Association has stood they will get out of the American Medical Association.

Types of Radiology-Hospital Contracts—1 The radiologist is employed on a salary by the hospital.

2 The radiologist leases space and apparatus from the hospital as a private practitioner.

3 The radiologist operates on some sort of commission basis. Or variations or combinations of 1, 2, and 3.

A It was stated that 37 per cent of all radiologists are employed on a salary basis. (Later it developed that this figure included radiologists in government hospitals and in other full time positions.)

B Nine per cent lease the departments on fixed rental.

C Fifty-four per cent share gross receipts or net receipts with the hospital. Of this 54 per cent about half (27 per cent) are under legal relationships which make the radiologist a tenant, and about half (27 per cent) an employee of the hospitals. In either of these the radiologist can be on a percentage basis. The hospital is not legally liable for the radiologist if he is a tenant. With respect to technicians, the great proportion are employees of the hospitals. About 10 per cent of radiologists appoint and pay their own technicians.

At this point the following suggestions were offered:

1 That the per diem paid by the patient for hospitalization may not include radiologic services or any other medical services.

2 That bills to patients for radiologic services should be presented on the billhead of the radiologist and not on the billhead of the hospital.

The advantage of billing by the radiologist would be (a) The patient would feel that he had personal service of the radiologist. (b) The radiologist would feel a greater sense of responsibility to the patient.

In objection, it was suggested that this billing by the radiologist would run counter to principles set forth by the Judicial Council of the American Medical Association in that the proceeds of the radiologist's bill would subsequently be split with the hospital. To avoid this the radiologist would have to give up his salary.

Nineteen per cent of the radiologists collect the fees in their own departments of the hospitals.

Blue Cross Plans—The discussion next turned on Blue Cross plans. It was stated that one of the bases for approval of Blue Cross plans was that they should have the approval of local and county medical societies.

The College of Radiology has always maintained that radiologic service should not be included in hospital service, yet of

seventy-seven Blue Cross plans approved by the American Hospital Association half of them guarantee medical service to subscribers.

A representative of the American Hospital Association stated that, in New York, Blue Cross plans were approved by the New York Medical Society. This was denied by the radiologists, in that vociferous objections have been raised. The five borough societies and the state society of New York have not officially approved the inclusion of medical service by the Associated Hospital Service of New York.

In Philadelphia the Philadelphia Medical Society went to court to prevent the inclusion of medical service in group hospitalization plans.

The difficulty seems to be that many members of county medical societies put their influence behind these group hospital plans, irrespective of any action they may have taken themselves as members of the societies.

If group hospital plans had not entered the picture, the other phases of relation of radiologists to hospitals might have been corrected slowly by evolution.

But if group hospitalization comes in and cements a branch of medicine as a part of hospital care and guarantees to subscribers not only bed, food and nursing care but also the services of a doctor, then the correction of other less objectionable features of historical origin becomes impossible.

The American Medical Association for years has pointed out the dangers which have developed in these plans, both group hospital and medical service plans, and has been called obstructionist and reactionary.

Another objection to the inclusion of x-ray service in hospital service plans is that such inclusion inevitably leads to deterioration in quality of radiologic care. There is overutilization of the radiologist's services, with a lack and promise type of radiologic care.

If the hospitals would take a stand against inclusion of radiology in the per diem charge, real progress toward a solution of the difficulties would be made.

Instances of overutilization were cited.

The radiologists then asked that the representatives of the hospital associations recommend to their organizations that Blue Cross plans do not include professional services, i.e. radiology, etc.

In the discussion it appeared that the American Hospital Association is willing to include medical services for sale by the Blue Cross plan if the local society approves it.

The American Hospital Association "has to deal with the practical thing that is happening." "The local medical society in Michigan through the Blue Cross plan is selling medical care."

"The Blue Cross plan in many respects is a measure of the attitude toward medical practice in the given community."

The Blue Cross plan is a name under the control of the Hospital Commission of the American Hospital Association.

"If a hospital plan refuses to abide by the rules laid down by that commission, the commission can deny that plan the right to use the words Blue Cross plan and participate in national publicity" loses chance to

"The Council of the California Medical Society rebuked the Intercoast Association and threatened to withdraw the approval, and they said 'Go ahead, we will still settle contracts'."

"The Commission on Hospital Service of the American Hospital Association on February 11 adopted a uniform national contract recommending to all Blue Cross plans the inclusion of complete pathologic service and anesthesia and radiology up to \$15."

It was stated that the American Hospital Association has not yet approved this recommendation but it is under consideration. The Blue Cross plan included medical service as a "selling point." Blue Cross plans have to compete with old life insurance.

In the discussion of the nature of a report that might be offered by those representing the hospital associations and the

Board of Trustees of the American Medical Association the following proposals were considered "The report might well call attention to and say a word of caution about the general encroachment into the field of medical responsibility by non-medical people as a danger to the future health of the country, as a danger to the medical profession

Secondly, to call attention and to condemn the institutional practice of medicine through certain staff appointment procedures that have since taken place

Thirdly, the implication of hospital contracts for medical practice, and the validity and ethical character of those contracts must be judged by the principles laid down by the Judicial Council for the regulation of contract practice of the physician. In other words, just because a physician makes a contract with a hospital is no reason why the principles laid down by the Judicial Council for contract practice are to be held in abeyance. Those are fundamental in medical practice

Fourthly, perhaps, emphasize the vast extent of medical responsibility in certain technological procedures that are now being entrusted to nonmedical people in the hospital"

Question was raised as to whether points 2 and 3 would be kindly received by the American Hospital Association"

HISTORICAL REVIEW AND COMMENT

The subject matter considered followed the direction of resolutions presented to the House of Delegates

1 The resolutions introduced by Dr E H Skinner, Section on Radiology, at the annual session of the House of Delegates at Atlantic City, N J, June 8-12 1942

WHEREAS The House of Delegates approved a resolution introduced by Dr Harry H Wilson at the 1941 session instructing the Board of Trustees of the American Medical Association to confer with similar committees representing the American Hospital Association and the Catholic Hospital Association of the United States the conjoint committees to study and submit reports to their respective national bodies in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in prepayment hospitalization and similar plans the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association and

WHEREAS The Board of Trustees was requested in the same resolutions to proceed to these matters as expeditiously as may be possible and

WHEREAS Evidence of continued encroachment of hospitals into the practice of medicine is manifest in numerous group hospitalization plans which offer certain medical services on a service basis as a part of hospital care and in plans adopted by numerous hospitals which include certain medical services in an all inclusive per diem rate for hospital care now therefore be it

Resolved That the House of Delegates reaffirms the principles enunciated in official resolutions over a period of many years opposing the practice of medicine by corporations or the interjection of a third party into the personal relationship and financial transaction between doctors and patients and be it further

Resolved That hospital corporations should not be permitted to engage in the practice of medicine through the medium of employed physicians or to enter into contracts with any individual group or agency whereby the hospital agrees to furnish any medical services and be it further

Resolved That to the end that hospitals be discouraged from offering the services of licensed physicians to patients on a contract or service basis all fees for medical services rendered in hospitals should be collected by or on the account of the physician rendering such service and all physicians concerned in the care of a patient should give or send directly to the patient or other responsible party a statement showing charges for professional services rendered provided however that an exception to the foregoing principle may be made in the case of a formally organized partnership of physicians which acts in the capacity of an individual and be it further

Resolved That the definitions of medical service and hospital service as applied to the principles stated herein shall be consistent with those applied in previous declarations of the House of Delegates in which medical services are construed as the services rendered by licensed practitioners of medicine and hospital service as limited to hospital accommodations such as bed operation room medicines surgical dressings and general nursing care and be it further

Resolved That the Board of Trustees be urged to proceed to the clarification of these problems as requested by the House of Delegates at the 1st annual session

2 The Reference Committee on Legislation and Public Relations in joint meeting with the Reference Committee on Miscellaneous Business considering these resolutions reported that the resolutions introduced no new principles not already accepted

by this House at former sessions and ask only definite clarification and study by the Board of Trustees. The joint committee recommended the adoption of the resolutions

3 The concluding paragraph of Dr Skinner's resolutions refers to resolutions introduced by Dr Harry H Wilson, California, at the Cleveland session of the House of Delegates in 1941

Resolutions Requesting Appointment of Committee to Confer with Committees of Hospital Associations

Dr Harry H Wilson, California presented the following resolutions which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS In the drafting of policies or contracts to cover medical and hospitalization services of nonprofit and other prepayment organizations it is of primary importance that the agreements or contracts shall make a clear differentiation of medical and hospitalization services that will permit physicians who give pathologic laboratory x-ray laboratory anesthesia or similar services to maintain their physician patient relationship and their own status as physician specialists and

WHEREAS In many plans designed to promote more adequate service among lower income groups of citizens it has seemingly been difficult to maintain the necessary professional distinctions concerning such medical work and the ways and means whereby compensation shall be made therefore now therefore be it

Resolved That the California Medical Association through its constituted authorities herewith requests the House of Delegates of the American Medical Association to instruct the Board of Trustees of the American Medical Association to appoint a committee of such number as may be deemed advisable to confer with similar committees representing the American Hospital Association and the Catholic Hospital Association of the United States the conjoint committees to study and submit reports to their respective national bodies in which would be outlined platforms or principles designed to clarify the relation of medical services that may be offered in prepayment hospitalization and similar plans the same to be in line with the basic principles laid down in the past by the House of Delegates and other authorities of the American Medical Association and be it further

Resolved That the Board of Trustees be requested to proceed in these matters as expeditiously as may be possible and to submit the committee's report with such suggestions and/or recommendation that the Board of Trustees may wish to attach thereto at the next annual session of the American Medical Association the Board of Trustees to be authorized in the interim to advise the constituent state associations of the American Medical Association concerning tentative or other agreements that may have been reached

The reference committee recommended the approval of the resolutions and added

Medical Service Plans and the Specialty Societies Your reference committee further recommends that the specialty societies such as those composed of radiologists, pathologists and anesthesiologists recommend to their members that they defer entering into contractual relationships with hospitals involved in medical service plans until the relationship has been thoroughly clarified as requested in the resolutions from the California Medical Association

4 The resolution presented by Dr Lyell C Kinney California at the Atlantic City session June 1942

Resolutions on Improvement of Relations Between Physicians and Insurance Companies

WHEREAS It is desirable that physicians and insurance companies cooperate to the fullest extent especially in the interest of persons covered by health and accident insurance and

WHEREAS A serious situation has arisen in the administration of certain health and hospitalization schemes whereby medical services are being billed under the term hospital services and are being paid for by insurance companies as they are labeled hospital services and

WHEREAS The continuation or extension of such practices will inevitably lead to the inclusion of any type of medical service under the label Hospital Service at the convenience of the corporations involved and to the detriment of medical care now therefore be it

Resolved That the House of Delegates of the American Medical Association herewith requests insurance companies to cooperate with the organized medical profession to the end that hospitalization policies shall include only hospital benefits. If the inclusion of indemnification for medical services such as surgery or radiology is desired then payment of such shall be made only on receipt of certified statement from a physician that he has rendered such. Fees for medical services should be paid to physicians via indemnity to the assured or by check payable jointly to assured and physician. This practice should be maintained irrespective of whether a hospital chooses to bill for medical services as a part of its hospital bill and be it further

Resolved That the House of Delegates of the American Medical Association requests hospitals and physicians to cooperate with it in this important step by seeing that bills for hospital and medical services are clearly distinguished. The latter should bear the name of the physician rendering the service to indicate clearly that the charge is for medical service.

5 The Reference Committees on Miscellaneous Business and Legislation and Public Relations acting jointly reported that these resolutions involve many additional technicalities and require prolonged and delicate negotiations with insurance carriers which will be time consuming and difficult of attainment. So before committing our organization definitely to the line of action which these resolutions demand, your joint committee recommends that the resolutions be referred to the Board of Trustees for study by itself and the Bureau of Medical Economics as to the facts, feasibility of action requested and as to ways and means of accomplishing the desired results. Your joint committee does not at the present time recommend the passage of these resolutions in their present form. A separate report is being submitted by the Board of Trustees concerning these recommendations.

6 As the three resolutions quoted in similar terms requested study, clarification and outlining of principles and referred to resolutions introduced in earlier years it was obviously necessary to examine the records of previous actions by the House of Delegates, reports of the Board of Trustees and Bureau of Medical Economics and the extensive studies of various hospital and insurance plans continuously being carried on by that Bureau.

Reports of the Council on Medical Education and Hospitals, the Judicial Council, Bureau of Legal Medicine and Legislation and the Committee on Legislative Activities were also studied. To enumerate or copy in their entirety all the actions of these respective agencies of the American Medical Association relating to the subject matter of these resolutions would be too lengthy for this report.

As early as 1931 the Judicial Council in its report to the House of Delegates disapproved of the collection by hospitals of fees for professional services to patients and payment by them to the attending physicians. The House of Delegates suggested that this matter be studied by the Judicial Council or some special committee. The matter was referred to the newly created Bureau of Medical Economics, whose earliest activities were directed to methods of distribution of medical care.

REPORTS OF STUDIES OF PLANS AND ADVICE IN AVOIDANCE OF DANGEROUS PATTERNS FOLLOWED EACH YEAR

In 1934 at the Cleveland session a resolution introduced by Dr. Albert Soiland, Section on Radiology, stated that some hospitals were doing "collective bargaining for x-ray business" to the detriment of their staff roentgenologists. The reference committee considered "the questions involved in the resolution as being primarily ethical rather than truly economic and for this reason, while recognizing the evils, refrains from direct comment concerning them and recommends that the resolutions be referred to the Council on Medical Education and Hospitals for such action as its wisdom may indicate."

As a result of study by the Bureau of Medical Economics, the ten basic principles for guidance in the formulation of any method of distribution of medical service were presented to the House of Delegates at the 1934 annual session and approved by it as follows:

First All features of medical service in any method of medical practice should be under the control of the medical profession. No other body or individual is legally or educationally equipped to exercise such control.

Second No third party must be permitted to come between the patient and his physician in any medical relation. All responsibility for the character of medical service must be borne by the profession.

Third Patients must have absolute freedom to choose a legally qualified doctor of medicine who will serve them from among all those qualified to practice and who are willing to give service.

Fourth The method of giving the service must retain a permanent, confidential relation between the patient and a "family physician." This relation must be the fundamental and dominating feature of any system.

Fifth All medical phases of all institutions involved in the medical service should be under professional control, it being understood that hospital service and medical service should be considered separately. These institutions are but expansions of the equipment of the physician. He is the only one whom the laws of all nations recognize as competent to use them in the delivery of service. The medical profession alone can determine the adequacy and character of such institutions. Their value depends on their operation according to medical standards.

Sixth However the cost of medical service may be distributed, the immediate cost should be borne by the patient if able to pay at the time the service is rendered.

Seventh Medical service must have no connection with any cash benefits.

Eighth Any form of medical service should include within its scope all legally qualified doctors of medicine of the locality covered by its operation who wish to give service under the conditions established.

Ninth Systems for the relief of low income classes should be limited strictly to those below the "comfort level" standard of incomes.

Tenth There should be no restrictions on treatment or prescribing not formulated and enforced by the organized medical profession.

In 1935 at the Chicago special session, in a resolution presented by Dr. Albert Soiland, the House of Delegates was asked to emphasize again particularly the necessity for separate provision for hospital facilities and the physician service and that payment for medical services, whether by prepayment plan, installment purchase or so-called voluntary insurance plans, must hold an absolutely distinct remuneration for hospital care on the one hand and the individual personal scientific ministrations of the physician on the other hand. The matter was referred to the Bureau of Medical Economics for study of existing plans.

At Atlantic City in 1935 the House of Delegates approved the report of the Bureau of Medical Economics cautioning against the national development of such schemes as would lead sooner or later to an inclusion of medical service in one form or another with inevitable deterioration in the quality of service.

At this meeting also the sixth one of the basic principles was changed to read "In whatever way the cost of medical service may be distributed, it should be paid for by the patient in accordance with his income status and in a manner that is mutually satisfactory."

In 1936 at the Kansas City session of the House of Delegates resolutions were introduced by Dr. Albert Soiland, Section on Radiology, titled Resolutions on Taking Steps That Will Result in Practice of Medicine Being Conducted by Physicians and Not by Hospitals.

WHEREAS Certain lay groups in this country are arranging for attempting to arrange for the provision of diagnostic medical services along with and in part of hospital services and

WHEREAS The provision of such diagnostic medical services must inevitably foster fundamental changes in the practice of medicine and

WHEREAS The American Medical Association is of the opinion that the practice of medicine should at all times be confined to fully licensed physicians, and

WHEREAS Chapter III article VI section 4 of the Principles of Medical Ethics sets forth the following

"It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual by whatever name called or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him. Such a procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people and is against sound public policy."

Now therefore be it

Resolved, That the House of Delegates of the American Medical Association is unalterably opposed to such practices, and be it further

Resolved That the House of Delegates of the American Medical Association is opposed to the division of any branch of medical practice into so-called technical and professional portions, and be it further

Resolved That the Council on Medical Education and Hospitals of this Association be and is hereby authorized and directed to take such steps as will result in the practice of medicine being conducted by physicians and not by hospitals and be it further

Resolved That the said Council be and hereby is directed annually to report to this House of Delegates such progress as it is able to achieve from time to time

Resolutions also introduced at the 1936 session by Dr Edward M. Pallette, California, titled Resolutions Disapproving Division of Any Branch of Medicine into Technical and Professional Portions, stated that certain lay groups are endeavoring to arrange for the provision of diagnostic medical service along with and as a part of hospital service and pointed out that such fundamental changes in the practice of medicine may well result in deterioration of our present medical standards and especially in deterioration in the quality of medical care furnished to hospital patients and that it is the official policy of the House of Delegates that it disapproves of the division of any branch of medicine into technical and professional portions. It directed also that the resolutions be brought to the attention of the American Hospital Association and its affiliated groups to the end that existing arrangements permitting division in medical practice be terminated as speedily as possible.

At the same session Dr Francis F. Borzell, Pennsylvania, introduced resolutions referring to the previous actions of the House of Delegates in defining the practice of radiology for diagnostic or therapeutic purposes as the practice of medicine. They referred also to action of the Council on Medical Education and Hospitals in establishing a standard for a radiologic department in approved hospitals and requiring that the department be under the supervision and control of a competent radiologist. The resolutions stated that it was alleged that certain hospitals were proposing to divide the practice of radiology into professional and technical services. The House of Delegates took action disapproving any efforts to divide the service in that manner as being detrimental to the best interests of the public, the medical profession and the hospitals. The action further directed that copies of the resolutions be sent to the American Hospital Association, the Catholic Hospital Association, the American College of Surgeons and the American College of Radiology.

The reference committee to which the resolutions of Dr. Soland, Dr. Pallette and Dr. Borzell were referred reported as follows:

1 It reiterates the principle enunciated by the House of Delegates at Cleveland in 1934: That the Practice of radiology, whether for diagnostic or therapeutic purposes, constitutes in fact the practice of medicine. The action of the House of Delegates in 1925 establishing a section on radiology confirms this principle.

2 It further recommends that all services connected with the practice of radiology be under the direct control and supervision of the medical profession and this same principle pertains to other technical and professional services.

In 1937 at the Atlantic City session the Bureau of Medical Economics in its report to the House of Delegates presented a comprehensive statement of its study of the various group hospitalization plans and submitted ten principles of organization and administration for guidance in establishment and direction of group hospitalization plans.

1 The plan of organization should conform to state statutes and case law. The majority of the governing body of the hospital insurance plan should be chosen from among members of official hospital groups and members of medical societies. Great care should be taken to assure the nonprofit character of these new ventures.

2 The plan should include all reputable hospitals. The qualifications of the participating hospitals should be closely supervised. Member hospitals should be limited to those on the Hospital Register of the American Medical Association or to those approved by the state departments of public health or other state agencies in those states in which there is approval, registration or licensing of hospitals.

3 The medical profession should have a voice in the organization and administration of the plan. Since hospitals were founded to serve as facilitating means to the practice of

medicine the medical profession must concern itself intimately with plans likely to affect the relations of hospitals to physicians.

4 The subscriber's contract should exclude all medical services—contract provisions should be limited exclusively to hospital facilities. If hospital service is limited to include only hospital room accommodations, such as bed, board, operating room, medicines, surgical dressings and general nursing care, the distinction between hospital service and medical service will be clear.

5 The plan should be operated on an insurance accounting basis with due consideration for earned and unearned premiums, administrative costs and reserves for contingencies and unanticipated losses. Supervision by state insurance departments has been advantageous for both the buyer and the seller of insurance contracts. Laws permitting the formation of hospital service corporations should not remove the benefits of such supervision nor violate the principles enumerated.

6 There should be an upper income limit for subscribers. If group hospitalization plans are designed to aid persons with limited means to secure hospital services they should render such service at less than regular rates. If no consideration in rates is made for persons with limited means group hospitalization plans lose their altruistic purpose and there may be little justification for an income limit.

7 There should be no commercial or high pressure salesmanship or exorbitant or misleading advertising to secure subscribers. Such tactics are contrary to medical and hospital ethics and are against sound public policy.

8 There should be no diversion of funds to individuals or corporations seeking to secure subscribers for a profit. The moment hospitals lose their traditional character as institutions of charity and humanitarianism the entire voluntary hospital system will break down.

9 Group hospitalization plans should not be utilized primarily or chiefly as means to increase bed occupancy or to liquidate hospital indebtedness. Such plans if they are necessary should place emphasis on public welfare and not on hospital finances.

10 Group hospitalization plans should not be considered a panacea for the economic ills of hospitals. They can serve only a small portion of those persons needing hospital services. Hospitals must continue to develop efficient methods of administration and service independent of any insurance method or selling their accommodations.

At the same session a resolution introduced by Dr. C. W. Stone, Ohio, requested the House of Delegates of the American Medical Association to clarify its policy in the question of group hospitalization, especially in the matter of defining and enumerating the services which should not be included because they are definitely medical services. This resolution was introduced after action by the House of Delegates of the Ohio State Medical Association because of stated confusion and controversy in many group hospitalization plans.

The reference committee reported that it is advisable to define hospital facilities rather than to attempt a comprehensive definition of medical practice.

"It is recommended therefore that the contract benefit provided by group hospitalization insurance should be limited to the room, bed, board, nursing facilities and routine medicines ordinarily provided by hospitals.

Your reference committee would refer to the report of the Board of Trustees, page 22, principle 4 which was adopted by this House of Delegates. In that paragraph the limitations of hospital service are well defined. Your reference committee reaffirms this definition of hospital care and recommends its application to contracts for group hospitalization. In regard to certain benefits offered by many hospital insurance plans combining professional and technical services your reference committee is in complete sympathy with those who would make every possible provision to prevent inclusion of any and all types of service involving medical care.

It is the opinion of your reference committee that further conference between interested medical groups and the American Hospital Association would be of definite value in clarifying the twilight zone between hospital service and medical care.

The report of the Bureau of Medical Economics discussed group hospitalization plans at length. In considering the reasons leading to the formulation of principles for guidance of those seeking to establish group hospital plans, the Bureau report stated "Notwithstanding the efforts of medical societies and this Bureau, as well as the reports of the Judicial Council and the action of the House of Delegates on group hospitalization at the Kansas City session to develop principles for the guidance of the group hospitalization movement, few, if any, of the plans exclude all medical services from their group hospitalization contracts. The extent to which medical services are included in the hospital service contracts is shown in the report of the Bureau."

The report of the Council on Medical Education and Hospitals to the House of Delegates in 1937 stated "In cooperation with the Judicial Council, efforts are being made to secure information concerning the tendency of some hospitals to engage in the practice of medicine through the device of hiring physicians to care for patients while the hospital itself collects the fee for the services rendered."

In the same session the report of the Judicial Council stated "The 1935 House of Delegates recommended that the 'Council on Medical Education and Hospitals together with the Judicial Council, formulate a plan whereby all those associated in the delivery of medical service be included in the investigation of hospitals for classification and that approval be based in the future on the ethical practices in the institution as well as on its scientific work.'"

Consequently the Judicial Council met with the Council on Medical Education and Hospitals in February this year and after thorough discussion presented the basis of a plan for the desired cooperation of the two councils.

The problem, which involves many difficulties, will require some time for its solution."

Continuing, the report states "Economic subjects invariably involve ethical questions."

The report of the Judicial Council further discussed paragraphs from article VI, chapter III, Principles of Medical Ethics, referring to "compensation," "conditions of practice," "contract practice" and certain features or conditions which if present make a contract unethical. Minor changes were made chiefly in the order and heading of certain paragraphs. Section III was made to read "By the term 'contract practice' as applied to medicine is meant the carrying out of an agreement between a physician or a group of physicians, as principals or agents, and a corporation organization, political subdivision or individual, to furnish partial or full medical services to a group or class of individuals on the basis of a fee schedule, or for a salary or a fixed rate per capita." The House of Delegates approved the changes.

The 1938 session of the House of Delegates at San Francisco was given a large amount of factual material by the Bureau of Medical Economics as a result of the national survey of need for medical care. Group hospitalization was also reported on and a comprehensive study of "Group Hospitalization Insurance was published." The background for some unsatisfactory relations between hospitals and physicians was discussed and it was pointed out that efforts to improve hospital finances must not destroy the quality or opportunity for improvement of medical services. The following paragraphs are quoted as a clear statement of some reasons for opposition to dangerous tendencies "It is unethical, and therefore contrary to good public policy, for hospitals to participate in the practice of medicine in order to obtain an income to finance other hospital activities or to attempt to lower the cost of special medical services by methods that impair the quality of the service or prevent the development of an improved service. Where such a situation exists the patients may be overcharged for the medical services of the medical department, the medical specialists may be receiving an insufficient income, or the services may not be maintained at a proper standard because of the use of cheaper technical assistants or because of inadequate equipment or insufficient or underpaid personnel. The proper method of remuneration for the hospital and the physician should enable the hospital to provide adequate building, equipment and personnel without necessitating an attempt to control or to employ physicians and should permit the physician to schedule his charges so as to make it possible for all patients to have easy access to necessary special medical

services. In keeping with the ethics of the medical profession, both hospitals and physicians must place service first and financial considerations second."

The reference committee approved the report of the Bureau of Medical Economics and recommended that the ten principles adopted in 1937 as the policy of the American Medical Association be amplified by the addition of the following statements to principle four "If for any reason it is found desirable or necessary to include special medical services such as anesthesia, radiology, pathology or medical services provided by out patient departments, these services may be included only on the condition that specified cash payments be made by the hospitalization organization directly to subscribers for the cost of such services."

At the same meeting of the House of Delegates in San Francisco, Dr. Francis F. Borzell, Pennsylvania, introduced the following resolutions

WHEREAS the American Medical Association has through its House of Delegates and its various bureaus and councils from time to time propounded certain principles of ethics and established standards of relationship looking toward the maintenance of the highest quality of professional service both in private practice and in hospitals, and

WHEREAS, Many of these pronouncements refer specifically to those special branches of medicine involving somewhat unusual relationship between hospitals institutions and the physician practicing these specialties in the hospital, and

WHEREAS Certain usages have sprung up which are tending to involve ethical and legal considerations and

WHEREAS It would appear to be highly desirable and in the best interests of good medical practice and sound public policy to have certain of the aforementioned pronouncements clarified, codified and in some instances reiterated, be it

Resolved, That the Council on Medical Education and Hospitals be requested to study the status of clinical and pathologic laboratories, radiologic departments and physical therapy departments in hospitals and institutions with a view toward standardizing the relationship of these services to these institutions and when necessary reaffirming principles of ethics involved in these relationships, and be it further

Resolved, That the Council be authorized to confer with such agencies as are deemed necessary to arrive at these conclusions

The Council on Medical Education and Hospitals, to which these resolutions were referred, reported as follows

"The resolutions of Dr. Francis F. Borzell, Pennsylvania, Dr. Charles H. Goodrich, New York, and Dr. E. H. Skinner, Section on Radiology, which were referred to the Council on Medical Education and Hospitals, all dealing more or less with the same subject, were considered together. The proposers of these resolutions, the delegates from the Massachusetts Medical Society, members of the California Medical Association and others met with the Council to express their views concerning the problems that concern the practice of medicine in hospitals by radiologists, pathologists and anesthesiologists. These problems have been rendered more acute by the rapid extension of systems of group hospital insurance within the last few years.

"The Council believes that these problems are of vital concern to the medical profession, that unwise decisions at this time may lead to consequences that would be disastrous to physicians and to the public alike, and that, therefore, a serious study should be made of existing relationships between hospitals and the physicians practicing therein, especially in the departments of anesthesia, radiology, pathology and physical therapy, with a view to standardizing the relationship of these services to the hospital and, where necessary, of reaffirming the principles of ethics involved.

"The Council recommends that it, jointly with the Bureau of Medical Economics, be authorized to undertake these studies and to confer with other interested agencies in order that it may be in a position to establish ethical standards for the practice of medicine by physicians holding positions in hospitals and to prevent the exploitation of either the public or the profession. If during this study it is revealed that hospitals registered and approved by the Council are exploiting the public or the profession, such approval may be revoked."

At the 1939 session of the House of Delegates in St. Louis the Council on Medical Education and Hospitals reported that, owing to extra work created by the National Health Conference and action against the Association in the District of Columbia, the Council was not in a position to make a complete report on medical practice in hospitals in accordance with the instructions of the House of Delegates in 1938 but stated that an

agreement has been reached with a representative group of radiologists as to the definition of the function of the radiologist in the hospital." This definition is incorporated in the Revised Essentials of a Registered Hospital.

These Essentials of a Registered Hospital are familiar to you. Radiologic standards for service to the patients and educational purposes are clearly defined. It is stated also that "It shall not be the policy of the hospital to make a profit from the department of radiology." Conformance to the Principles of Medical Ethics of the American Medical Association is also required to become eligible for registration.

The Bureau of Medical Economics reported at length on the progress of Group Hospitalization Plans.

It was also reported that "The American Hospital Association at its last session approved the extension of hospital care insurance plans to include medical fees in hospital practice when the arrangements are approved by the local county medical society." It was stated also that a joint report of the three national hospital associations has suggested that federal legislation be sought to permit the licensing of hospital service corporations similar to the federal licensing of credit unions. It was contemplated that such federally licensed hospital service corporations would be the proper agencies to enter into contracts with the government for the hospital care of the indigent sick.

These matters were discussed at a conference of the board of trustees of the American Hospital Association and representatives of the Catholic Hospital Association and the American Protestant Hospital Association on the invitation of the Board of Trustees of the American Medical Association at the offices of the American Medical Association on Feb. 15, 1939. The following paragraphs are taken from the report to the House of Delegates: "Various matters of mutual interest to the groups represented were frankly discussed, and it was most gratifying to note that there was decided unanimity of opinion with respect to many phases of the general subject of medical care in hospitals even though there may be some differences between the basic policies of one or more hospital associations and those of the American Medical Association."

"Among questions that received consideration at this conference were those having to do with group hospitalization and an apparent tendency on the part of some of the hospital groups to include both special and general medical service in contracts offered to their members as well as other questions of major importance and present interest." During the conference the following resolution was unanimously adopted by the representatives of the three hospital associations:

"The representatives of the American Hospital Association, the Catholic Hospital Association and the American Protestant Hospital Association here present desire to express to the Board of Trustees of the American Medical Association their confidence in the leadership of the medical profession in furthering the excellence of medical service and in aiding the solution of problems of the distribution and provision of medical care."

At a later time the following resolution was approved by all those who participated in the conference:

"It is moved that the following be the sense of this meeting: This gathering of the Trustees of the American Medical Association with representatives of the American Hospital Association, the Catholic Hospital Association and the American Protestant Hospital Association expresses its gratification on the unanimity of opinion developed concerning many phases of the health problems of the nation achieved by mutual discussion. It is recommended to the American Medical Association, the American Hospital Association, the Catholic Hospital Association and the American Protestant Hospital Association that such joint meetings of their representatives be held for the consideration of problems of mutual concern."

It was not possible that all matters of mutual interest to those who participated in the conference could be fully considered nor did it seem wise to undertake at the time to examine minutely the reasons for some possible differences in the policies of all the organizations represented in the conference. There seemed to be unanimous agreement that the physician is supreme in the hospital in all matters pertaining to medical service rendered in hospitals.

A tabulation of information was submitted under the title of Economics of the Practice of Radiology in 1939. This was in response to a recommendation by the House of Delegates that a joint study be made by the Council on Medical Education and Hospitals and the Bureau of Medical Economics to determine the existing relations between the hospitals and physicians practicing in them. Departments of anesthesia, radiology, pathology and physical therapy were especially to be studied in order that ethical standards might be established to prevent the exploitation of either the public, the hospitals or the physicians.

This report was based on completed schedules returned by 876 out of 1,434 members of the four radiologic societies, the American Roentgen Ray Society, the American Radium Society, the Radiological Society of North America and the American College of Radiology. The tabulation contains much valuable factual material and has been made available to those interested.

The Council on Medical Education and Hospitals at the 1940 session referred to the report of the Economics of Radiology but stated that it was not yet in a position to make a final report on the practice of pathology, anesthesia and physical therapy.

Mobilization of the profession for army and civilian medical care and problems connected with medical education and personnel have prevented a complete resurvey of this matter by the Bureau of Medical Economics and the Council on Medical Education and Hospitals. However, information has been accumulated and reports have been made from time to time. Apparently no new principles are involved and present developments may be described as a continuation of tendencies previously pointed out.

The hospital associations have repeatedly restated their confidence in the leadership of the medical profession in maintaining high standards of medical service and in aiding in the solution of problems of distribution and provision of medical care.

In 1939 the American Hospital Association published the Principles of Relationship Between Radiologists, Hospitals and Pathologists. Those concerning the relationship of radiologists and hospitals are as follows:

1 The radiological service of the hospital shall be maintained primarily for the benefit of the sick.

2 Every hospital radiological department should be under the direction of a competent radiologist, preferably a diplomate of the American Board of Radiology or one who is working toward that objective. If, because of size or isolation, such arrangement be not feasible, some member of the general medical staff trained in radiology should be in charge and a consultation service arranged with a nearby radiologist.

3 The radiologist is entitled to recognition as a professional member of the medical staff and as head of a hospital department.

4 The preservation of the unity of the hospital and its component departments and activities is an essential administrative principle. This principle can be maintained without any infringement on professional rights or professional dignity.

5 Inasmuch as no one basis of financial arrangement between a hospital and its radiologist would seem to be applicable or suitable in all instances that basis should be followed which would best meet the local situation. This may be on the basis of salary, commission or privilege rental but in no instance should either the hospital or the radiologist exploit the other or the patient.

6 When an arrangement is effected whereby the radiologist of the hospital pays rental for space and service cares for non-pay patients and in return retains all private fees collected such contract should clearly cover the matter of depreciation of equipment, replacements and additions should protect the radiologist against excessive nonpay work and should take into consideration the good will by virtue of which a large proportion of the paying clientele is attracted.

These principles were reported to have had the approval of (1) the board or trustees of the American Hospital Association, (2) the Radiological Inter-Society Committee (officially representing the American College of Radiology, the American

Röntgen Ray Society, the Radiological Society of North America and the American Radium Society), (3) the Council on Medical Education and Hospitals of the American Medical Association and (4) the American College of Surgeons.

It was not stated that the following paragraph was submitted to the American Medical Association for approval:

"The American Hospital Association and the Radiological Inter-Society Committee view with disapproval the proposal that the actual cost of films and associated overhead be separated from the professional charges of the radiologist or that the responsibility for this department be divorced from the hospital. While in many instances this would be a financial relief to the hospitals it would probably result in frequent omission of the radiological consultation with a specialist in radiology, would mean less efficient radiological service with potential legal complications and would tend to create difficulties with national and other organizations requiring supervision of the radiological work by a competent radiologist."

The American College of Radiology prepared a "Manual of Desirable Standards for Hospital Radiological Departments" and this was submitted to the Council on Medical Education and Hospitals of the American Medical Association which was reported to have expressed accord with these statements on May 17, 1939. There is no record that the standards of this manual were approved by the various hospital associations. Fiscal arrangements are defined as follows:

Radiology is a special type of medical practice and the physician practicing radiology requires special training just as do his fellow medical and surgical specialists. His conduct shall be subject to the same principles of medical ethics (those of the American Medical Association) as govern his fellow physicians.

The practice of radiology in a hospital is essentially the same as in an office building. Assuming that the executive medical staff of the hospital has selected the radiologist or radiologists whom it regards as the most desirable for its institution, the said radiologist or radiologists should conduct his or their practice in respect to private patients just as do his or their colleagues. It is desirable that the physician bill his private patients on his own billhead, adjusting his fees according to the ability of his patients to pay and making his own collection arrangements. When for purposes of convenience, the fee is collected by the hospital cashier, it shall be done on the physician's billhead or under his name in order to comply with the professional nature of the service.

The fees charged for radiological services shall be under the control of the radiologist. All systems of rebates, discounts, etc., shall be considered unethical, except that, where the patient's economic status is the determining factor, the radiologist like his fellow physician in medicine or surgery, may waive part or all of the fee.

"In the average private hospital the most satisfactory arrangement is one in which the radiologist leases the space or space and equipment from the hospital, paying the latter a monthly rental therefor. The amount of the monthly rental should be determined after a fair appraisal of the cost for maintenance of the department by a cost accountant, and should include every reasonable item. Provisions should be made for an amortization fund for replacement of equipment, if this is owned by the hospital. Some institutions may find it more convenient to base the hospital cost upon a patient basis. In such cases the cost per patient should be determined and the radiologist practicing in the department should pay the hospital that amount for each private patient whom he examines or treats in the department. Under either of these plans the hospital is protected against any loss, and the medical staff is permitted to carry on its practice in the most ethical and satisfactory manner for all concerned.

"If, pending the clarification of details concerning the lease agreement, it is decided by the hospital and the radiologist that a percentage arrangement should be made, such an agreement may be ethically reached. Inasmuch as a hospital is not entitled to profit from the fees earned by physicians practicing in its purview, it should not be the policy of the hospital to make a profit from the x-ray department. However, the hospital should receive a reasonable interest return on its investment in space

and such equipment as it furnished. The percentage division should be applied to the gross receipts of the department and not the net, as this would give prima facie evidence that the hospital was enjoying a profit from the professional services rendered by those in the department. The distribution will vary according to the nature of the institution, the amount of charity work handled, the actual cost of maintenance of the department, and other items, in the great majority of institutions, however, the hospital's cost should be defrayed with 50 per cent of the gross receipts, or less.

"In a few institutions (for example, where all staff members are on a salary and such an arrangement is countenanced by the American Medical Association) it may be necessary to adopt a fixed compensation plan. This, however, is the least desirable of the three acceptable types of fiscal arrangement and provides opportunity for strife and misunderstanding between the medical staff and the hospital administration. While it may be possible in some institutions, under a salary arrangement for the radiologist directing the department to build and maintain an outstanding department with entirely adequate service, such is actually exceptional. The department will grow more rapidly in usefulness and competency if the radiological staff is permitted to practice as private practitioners instead of as salaried employees of the hospital.

In no instance and under no arrangement is a hospital corporation entitled to any portion of the net profits earned by the radiological staff in the practice of its profession. Under percentage and salary arrangements it is difficult to adhere strictly to this principle. Nevertheless, it can be done, and the accounts of the department should be reviewed frequently by the hospital administrator and the radiologist in order that adjustments may be made to take care of fluctuating conditions that could result in a profit or a loss to the hospital corporation. Where a percentage or salary arrangement is in use, the accounts pertaining to the roentgen department should, of course, be open to members of the radiological staff at all times.

"By adopting a rental arrangement or by adhering to the principles outlined above, there should be assurance that adequate personnel, equipment, and supplies will be available in the roentgen department at all times. Professional personnel should be added to the department as rapidly as the income permits. In the case of large and busy hospital radiological departments it will obviously be necessary for several radiologists to be on duty or on call at all times in order that adequate service may be maintained.

"In the case of teaching institutions where the bulk of the work in the department is free of clinic work, the cost of the latter should be borne as is the cost of the free or clinic work in other departments. In the great majority of hospitals the clinic work amounts to less than 30 per cent of the total work of the department, and under these circumstances the radiologist or radiologists should contribute his or their professional services as do their colleagues. However, in the case of large teaching institutions, where the heads of departments are customarily paid an honorarium for supervising and conducting the teaching and routine clinic work of their departments, it is obvious that similar arrangements should be made with the radiologists.

"FEES

"The fees charged for radiological services shall be under the control of the radiologists and should be within the range for the locality. They shall be treated as are other medical fees, that is to say, varied according to the ability of the patient to pay. It is contrary to the ethics of the American Medical Association for physicians to issue fee schedules, it is equally unethical for a radiologist to permit a hospital to issue a fee schedule, even though he is not issuing it himself.

"The manual quotes from the Manual of Hospital Standardization of the American College of Surgeons:

"Fee splitting is transaction for financial gain practiced under contract, understanding, or by consent—silent or spoken—through which a portion of the compensating fee that a specialist or practitioner receives from a patient (presumably for his own services) is paid directly or indirectly to another individual or agent who was influential or instrumental in bringing the patient to the specialist or practitioner for operation or treatment.

It is the duty of the hospital management to exercise continuous vigilance to prevent fee splitting under any guise. The institution which harbors fee splitting must share the guilt with the perpetrator of the crime, and the onus of guilt when question arises, is also shared by the hospital.

From the standpoint of medical and nursing education, a fee splitting atmosphere in a hospital is detrimental to the proper cultural development of the intern, the medical student, and the student nurse inasmuch as they are in the formative years of their professional lives. While technical training is vitally important, it can count for nothing without a good background of ethics and respect for scientific medicine. Professional ethics and ideals of vocation cannot be implanted and developed in an environment which condones fee splitting.

The evils of fee splitting are well known to the medical profession and to hospitals. They must realize that the best interest of the patient can be properly protected only when service rendered is ethical as well as efficient. In this respect the service must be entirely free from any element of commercialism. With the practice of fee splitting this is impossible for too frequently the monetary aspect is more influential than the guiding forces of scientific medicine.

"GROUP HOSPITALIZATION"

In this connection it is emphasized that medical services of any type must not be included as a part of hospitalization benefits. They may be included along with hospital benefits provided that direct cash payments are made to beneficiaries of group hospitalization and beneficiaries then to remunerate their radiologist for such services as he has provided. Radiologists shall not permit the inclusion of their services in any type of health medical or hospitalization insurance not approved by their local county medical society and state and national medical organizations. Only in this manner can the health and welfare of the public at large as well as of the patients in that particular institution be adequately protected. The radiologist shall at all times cooperate with the governing board of the hospital in the development of all recognized plans tending to lower the cost of medical care and improve the quality of medical diagnosis and treatment.

APPENDIX B

'Excerpt from Essentials of a Registered Hospital' by the Council on Medical Education and Hospitals of the American Medical Association

General Statement—Hospitals should be organized and conducted primarily for the purpose of providing facilities where the sick and the injured of the community may be given scientific and ethical medical care.

Registration is a basic distinction between all recognized hospitals and those that are refused recognition. It is a prerequisite to the consideration of a hospital for approval for interns or for residencies in specialties.

The registration of hospitals, the approval of hospitals for interns approval for residencies in specialties, and all other service of the Association regarding hospitals is carried on by the Council on Medical Education and Hospitals. Separate essentials have been adopted for each of these types of approval.

It is the desire of the Council to cooperate in every way for the improvement of hospital service, whereby the sick and injured may be provided with scientific and ethical medical care.

The Council does not have nor does it assume legal authority over any hospital. It recognizes clearly that the officers in charge of such institutions have the unquestioned right to conduct the hospitals in any way they may deem wise. If a hospital desires to have its name appear on the American Medical Association Hospital Register and thus have the endorsement of the Association it should be willing to comply with the principles which the Council on Medical Education and Hospitals considers necessary.

Radiology—1 The responsibility for all radiologic examinations must rest on the physician roentgenologist who is head of the department. His findings and conclusions for all examinations should be placed in the patient's chart. Nothing in this

provision should preclude additional study and interpretations by qualified attending physicians on the staff. 2 The physician-roentgenologist should be preferably one who is a diplomate of the American Board of Radiology or a physician whose qualifications are acceptable to the Council on Medical Education and Hospitals of the American Medical Association. 3 It shall not be the policy of the hospital to make a profit from the department of radiology.

APPENDIX C

Principles of Financial Relations in the Professional Care of the Patient

Excerpt from the 'Manual of Hospital Standardization,' American College of Surgeons

1 Each doctor who participates in the care of a patient is entitled to compensation from the patient commensurate with the services rendered.

2 Whenever practicable and possible the attending doctor should acquaint his patient with his financial responsibility to those concerned with his care.

3 Each doctor concerned in the care of a patient should give or send directly to the patient a detailed statement showing charges for professional services rendered.

4 Combined statements should be avoided, as they may constitute subterfuges for fee splitting.

5 Each doctor who participates in the care of the patient should send a personal receipt directly to the patient for all moneys received from the patient or other legitimate or authorized source.

6 In so far as possible, a third person should not enter into the financial relations between doctor and patient, and to this end hospitals should be discouraged from determining or collecting fees for doctors.

7 An exception to the foregoing principles must, of necessity, be made when there is a formally organized clinic or legal partnership which in effect may be regarded as an individual and which acts in that capacity. This principle should apply also when the clinic and hospital are combined and under the same ownership.

8 The practice of having the referring doctor act as assistant or anesthetist in an operation should be discouraged unless he is competent for either or both of these duties by virtue of his training and continuous experience.

9 A surgeon who has a regular assistant at operations may pay him directly. When the assistant has referred the patient to the operating surgeon he should follow the procedure outlined in paragraph 3.

The American Hospital Association sets up certain requirements in its Approval Program and Standards for Blue Cross Hospital Service Plans as follows: First Adequate Representation of Hospitals, the Medical Profession and the General Public. Trustees or board members of the hospital service plan should receive no remuneration for service as trustees or board members. The interests and the responsibilities of participating hospitals make it necessary that a majority of the policy making body be hospital trustees and administrators. Trustees or Board Members of the Hospital Service Plan should receive no remuneration. Second Nonprofit Sponsorship and Control are required. Third Free Choice of Hospital and Physician suggests that all institutions of standing should be given choice of hospital and physician. Fourth Hospital Responsibility for Service to Subscribers describes the economic responsibilities to subscribers. Fifth Accounting Records defines accounting methods. Sixth Adequate Statistical Records and Actuarial Data enumerates required statistical records. Seventh Adequate Financial Support and Working Capital refers to working capital and financial statement. Eighth Reapproval Based on Record of Community requires annual review for reapproval. Ninth Equitable Payments to Hospitals refers to hospital costs and community economic needs. Tenth Diminished Promotion and Administration requires dignified promotion recognizing professional ideals and sound practices. Eleventh Hospitals and adjacent Blue Cross plans suggests definition of territory. Twelfth Subscriber Benefits Based on Hospital

Practice reads as follows: "Hospital service provided through a hospital service plan should be determined by the practices of the member hospitals of the particular plan. Member Hospitals are urged to cooperate with Blue Cross plans in providing complete hospital care to service beneficiaries under the subscribers' certificates. Thirteenth, Noninterference with Professional Relationships: Hospital service plans should not interfere with existing relationships between physicians and patients. Fourteenth, General Policies: A hospital service plan should, in all respects, meet with the general approval of the Board of Trustees of the American Medical Association."

C. Rufus Roem, Ph.D., director of the Commission on Hospital Service of the American Hospital Association, quotes the following as part of a statement issued on June 18, 1936 by the trustees of the American Hospital Association:

"Present practices of hospital organization have been developed in response to public need, and for many years fostered by the professional associations of this country, including the American College of Surgeons, the American Medical Association and the American Hospital Association.

"More than 10,000 physicians are now employed by hospitals on a full time or part time basis for the care of the sick or for laboratory services. Such intimate relationships are particularly common in the laboratory and x-ray departments from which diagnostic services are requested by other physicians. The discontinuance of these relationships between hospitals and physicians would make it necessary for each patient to establish business relations with, and pay fees to, each physician contributing directly or indirectly to his care in the hospital.

"The primary obligation of the hospital is to provide and organize all the services necessary for the diagnosis, treatment and rehabilitation of the patient.

"Provision of medical services in hospitals is part of the responsibility of the hospital and is consistent with the rights, privileges and obligations of the hospital staff physicians under their medical licensure. The performance of diagnostic and therapeutic procedures by staff members constitutes the practice of medicine in hospitals; it is not the practice of medicine by hospitals.

The Bureau of Medical Economics of the American Medical Association in its report to the House of Delegates in 1933 stated: "The medical profession is opposed to any plan that will destroy the basic features of medical service or will permit hospitals to enter the practice of medicine. If hospitals are permitted to include medical care in their contracts for hospital service, the precedent is set for institutionalized contract medical practice with all its destructive effects on the art and science of medicine."

At the same meeting the Judicial Council reported the following: "Whether the scheme (meaning the group hospitalization) is or is not financially or economically sound is not the problem of our organization, but it is our business to see that the furnishing of medical service is not included in the sale of insured hospital accommodations. This can be done if a strong stand is taken and maintained by the organized medical profession, which must keep a watchful eye to see that medical care is not initially or later included when the usual sales efforts demand increased benefits to purchasers. At the Atlantic City meeting of the House of Delegates in 1942 a resolution on Medical Service Plans, introduced by Dr. Charles E. Mongan, Massachusetts, carried the following: "Resolved, That the state and county units of the American Medical Association in undertaking medical service plans at the behest of the parent organization will have their hand supported if medical service contracts as well as cash indemnity contracts are given equally frank direct approval by the House of Delegates."

The reference committee recommended that the following resolution be adopted in substitution of the original resolution introduced by Dr. Mongan: "Resolved, That the House of Delegates of the American Medical Association approves that principle of medical service plans on a service basis when sponsored by a constituent state medical association or a component county medical society in accordance with the recommendations relative to medical service plans adopted by the House of Delegates."

There is a very close association between Blue Cross Hospital Plans and medical service plans in many places and it is reported that in some communities the hospital plans collect from subscribers to medical service plans sponsored by medical societies. The method of payment to physicians varies. The extent to which approval of some Blue Cross Hospital Plans by county medical societies as referred to in the resolution adopted by the House is equivalent to sponsorship of methods of providing medical service contrary to principles adopted by the House is subject to question. It must be recognized that many of the plans sponsored by component county or constituent state societies are based on legislation in which directing boards are made up of lay and professional members. In many instances the professional members are in the minority, and the interpretation of the authority and methods to which sponsorship was voted becomes still more confused. Without the examination of the legal background and organization structure in each of the local communities it would be impossible to judge the status of the individual plans from the basis of the principles set up by the House of Delegates.

The record of official actions, approved principles, published reports and manuals for guidance in formulating policies and plans were presented for the purpose of comparison and better appraisal of conditions now existing. Conferences were arranged by the Board of Trustees including the American Hospital Association, the Catholic Hospital Association, the Protestant Hospital Association and representatives of the Inter-Society Committee for Radiology and the American College of Radiology.

Existing relations between radiologists and hospitals were discussed. It was stated that about 9 per cent of the radiologists lease the department from the hospital on a fixed rental basis. Approximately 37 per cent of all radiologists are employed on a salary basis by the hospitals in which they work. The remaining 54 per cent share the gross receipts or net receipts with the hospitals. In some instances this is a combination of fixed salary and percentage. Therefore in about 9 per cent of contracts the radiologists employ or appoint and pay their own assistants. In almost all the other plans the hospitals employ the technicians. In the roughly 37 per cent of instances in which the radiologists operate the department on a percentage basis the hospitals employ and pay the technicians. In some instances the radiologists are given the responsibility of selecting and discharging their technical assistants, but the hospital pays the employees.

It was estimated by the representatives of the radiologists that not more than 19 per cent of the radiologists collect the fees of their own departments in hospitals. That estimate included the 9 per cent who operate the department as tenants. Therefore 10 per cent of those operating on a salary or commission or combination plans collect bills for their services. It is obvious that 90 per cent of the radiologists referred to are employed in some plan of contract practice.

In discussion of the medical ethics involved, it was noted that the Principles of Medical Ethics states that "contract practice, per se, is not unethical. However, certain factors or conditions if present make a contract unethical." The section continues with an enumeration of many factors which determine the ethical or unethical character of the relations. The concluding paragraph of section 3 reads: "Each contract should be considered on its own merits and in the light of surrounding conditions. Judgment should not be obscured by immediate, temporary or local results. The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole."

In a recent communication by the president of one of the larger hospital service plans it was stated that "the present hospital practices and traditions were evolved over the years through the cooperation of hospital administrators and their medical staffs long before the advent of the plan. The plan at no time since its inception has attempted to direct hospital practices. The sole function of the plan is to act merely as a medium whereby hospital services may be provided to the public on a budgetary basis. The hospital services are identical both for plan subscribers and for nonsubscribers."

"It is not possible for the plan to dictate hospital or medical practices. It would seem desirable that the formulation of

hospital and medical practices should remain the responsibility assumed by the medical profession and the hospital administrators. Would it not be in the best interest of the modern practice of medicine if medical problems arising in hospital practice could be carefully studied and solved through the cooperation of local hospital associations and the county medical societies?"

Continuing in part, it was stated. One of the basic and best features of the plan would be destroyed if the recommendations proffered by the Joint Council resolution were to be put into effect, in that is at all possible. If subscribers were required to pay professional fees for all x-ray, laboratory and anesthesia services rendered in the hospital there would be but half a plan and probably no plan at all after a short period. If the plan were to pay for those services on an individual fee basis this would prove unsatisfactory because of the varying rate schedules among our member hospitals and enormous difficulties of control.

The main problem, it seems to me, is the lack of uniformity in hospital practices to say nothing of the lack of uniform accounting.

It may be possible to enumerate the individual charges for x-ray and laboratory examinations, etc., and to make this information available to the physician rendering such services. In any event, A. H. S. is always eager to extend to the medical profession the utmost cooperation in the solution of mutual problems."

Eleven million people are reported at this time to be subscribers to Blue Cross Hospital Plans. Of the seventy-seven plans to which this group are subscribers 50 per cent include as a part of the hospital service the service of doctors and 90 per cent of the hospitals are including radiology as a part of the hospital service.

Hospital representatives as well as the statements of those responsible for the policies of the Blue Cross plans call attention to the standards for approval and note that they are not so organized that they can control local groups or plans, that the local plans should follow local community practice and that even if a local group were refused approval in the Blue Cross plan it could still continue to operate.

However, it has been reported that a uniform national contract has been proposed by the Commission on Hospital Service of the American Hospital Association recommending to all Blue Cross plans the inclusion of complete pathologic service, anesthesia and radiology to the amount of \$15. The manner in which this inclusion is to be financed merits discussion.

The public hospital should not use the hospital created monopoly control of radiologic service as a source of profit beyond the normal provision for replacement department development and proper proportion of over-all costs of operation of the hospital. Nor can it rightfully use per diem charges against all of the hospital patients to support a radiologic department devoted to creating bargains in radiologic service in order to make hospital group insurance attractive. On the other hand, the radiologist should not use the hospital created monopoly in such manner as to effect for himself an unfair profit or to permit deterioration of equipment and service.

Hospitals or radiologists employing personnel may be responsible for impairment of standards of radiologic work and exploitation of the public by not providing sufficient medical attention to the patient and by delegation of too much responsibility to technicians in their efforts to care for a large volume of patients with the least expense in professional personnel.

The Council on Medical Education and Hospitals of the American Medical Association does not have the authority to police hospitals considered for intern training. It inspects them only as to educational standards and facilities. Although this Council must give attention also to unethical practices in the hospital it is not in a position to rule on a question of such magnitude as the contractual relations of the radiologic departments in hospitals.

Hospital plans should be sold on their own merits. The statement that because of their unpredictable costs radiologic fees must be included to make the plans more attractive suggests that hospital plans cannot well be sold on their own

merits. This is not borne out by experience in communities in which the Blue Cross Hospital Plans do not include services of radiologists.

Administrators of the large group hospitalization plans and administrators of hospitals operating under these plans are beginning to recognize the abuses that develop. One state with a medically sponsored plan has concluded to discontinue the laboratory features because of the demand for unnecessary radiologic service. Many insured patients take the attitude that in carrying the insurance they have acquired the right to demand every service that the plan provides whether the attending physician deems it necessary or not.

Another abuse that is increasing greatly is that of applying for hospitalization for treatment of some condition for which laboratory study and x-ray examination have been advised. The subscriber remains in the hospital only the number of hours necessary for these examinations and then leaves the hospital. Some plans have endeavored to prevent this abuse by stipulating in their contracts that hospital service benefits will not be extended in those instances in which subscribers are admitted primarily for diagnostic x-ray or laboratory examinations or other diagnostic studies. Despite efforts to enforce this provision so that subscribers do not receive benefits for procedures which do not require hospital bed care and which could be performed by a physician outside the hospital, the abuse is increasing and cannot be completely prevented. Only the most complete cooperation of the physicians and hospitals can save these plans from steadily increasing abuses.

Hospital boards and administrators need guidance and support in maintenance of medical standards, necessary discipline and regulation of hospital practice, and formulation of policies. A medical staff acting as a committee of the whole made up of specialists may not be interested in dealing with the multitude of problems of hospital operation or care to give time or thought to its policies. A smaller group, advisory committee, appointed by the board of trustees and acceptable to the staff is often needed. Very many hospitals have similar plans of organization and find them useful in meeting the multitude of problems accompanying the rapid evolution of hospitalization.

Advisory committees can give valuable advice and guidance to lay boards and support to administrators and can assist the boards in presenting the problems of institutional operation to the medical staffs. In turn these advisory groups may give more time and thought to medical practices in the hospital and assist in interpreting the medical thought of the staff to the administrators and boards. Such advisory committees can also be better informed and helpful in discussing hospital policies in conference with county medical societies.

This is not a detached matter but is only one portion of the broader subject of hospital-physician relationship. Hospitals are buildings and equipment with trained personnel and are useful only when their facilities are utilized by physicians for the treatment of patients. Physicians in turn cannot give medical service of high standard without the facilities provided by hospitals. Therefore they must continue to cooperate as in the past, unselfishly, in promoting the development of scientific methods and sound practices directed to better care of the sick without exploitation of each other or the patients they treat.

Each community has its own peculiar problems and the answers are necessarily influenced by geographic location by educational factors, by economic limitations, by customs, community prejudices and influential personalities. These factors cannot be fairly evaluated by individuals at distant points who are not familiar with them. Patterns as outlined by general principles are national. Details are essentially local. The application of the code of ethics to local relationships and practices is a local responsibility.

Action of the House of Delegates at each meeting throughout a period of ten or more years as reported must be recognized as evidence that action of the House declaring certain conditions of practice unethical is not sufficient to correct them. Any remedy must depend on the acceptance of basic principles and their application to local problems by the whole medical profession of that community. It is noted that little reference has been made at any time to representation of the physician who is responsible for admission of the patient to the hospital although he requests the radiologic service and thus presumably

represents the patient to some extent in that transaction. Too often it is assumed that the hospital and the radiologist are the only ones interested.

Inasmuch as radiology must be a monopoly in the hospital, the position of the radiologist and the department of radiology is somewhat different than that of other specialties, such as surgery and medicine. The standards and conduct of that monopoly are, however, a matter of interest to all physicians who must depend on that department in making decisions of the utmost importance to their patients and themselves.

Many hospital representatives have indicated that they may change their group hospitalization plans and place the radiologist on the same plane as any other physician, making a definite charge for use of equipment and technical service. Necessary supervision of technical service is to be provided by the radiologist on a salary basis. Consultant service is to be charged to the patient by the radiologist and preferably be collected by him. Some hospital representatives state they prefer not to have radiologic charges appear in the popular mind as costs of hospital care.

It is the considered judgment of some good observers that the expansion of the activities of hospitals into the practice of medicine by increased employment of medical personnel would inevitably lead to necessary legal restrictions and other changes. These changes would be of such character as to destroy eventually the present status of hospitals as independent agencies providing high standards of facilities for care of the sick.

In considering the present status of the radiologist it is evident that he cannot occupy the triple position of an employee in the hospital, a partner participating in the profits of the department through sharing its receipts, and still retain the position of an independent contractor with the patient, such as pertains in the accepted patient-physician relationship. The situation becomes more involved when the hospital partner sells its services and his to the public through another agency—group hospitalization. Loss of his professional identity to the public makes his future dependent entirely on his employer. This statement cannot be construed as in opposition to group hospitalization to which medical approval has been given repeatedly. However, the Board of Trustees has been requested to make efforts to clarify the relationship of radiologists, anesthesiologists, pathologists and others with hospitals. The relations differ somewhat in each group. Radiologists and hospitals have been discussed here. Other studies may follow.

In 1937 the House of Delegates approved the following principle: "The subscriber's contract should exclude all medical services; contract provision should be limited exclusively to hospital facilities." Certainly this statement is clear and, until changed by the House of Delegates, represents the policy of the American Medical Association. An unselfish and realistic approach to the problem by all concerned would do much to hasten a not impossible solution of the problems under discussion.

Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the following report, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

To the Members of the House of Delegates of the American Medical Association

The activities of the Judicial Council during the past two or three years have been confined largely to acting on applications for Fellowship and to the consideration of inquiries submitted by individuals or groups. There have been almost no appeals from disciplinary actions of constituent associations for the Council to adjudicate. This is quite different from the situation five to ten years ago, when component county medical societies and constituent state medical associations were sensitive to infractions of their by-laws and the Principles of Medical Ethics and were active in bringing offenders to account. During that period the Council was seldom without an appeal to be heard from a decision by a constituent association. The question naturally arises as to the causes underlying such a condition. Are our organized societies more actively governing the ethics of the practice of their membership or has the stress of the times resulted in indifference to our ethical principles?

It might be inferred from the number and the nature of problems which have come up for decision by the Council in the last two or three years with respect to Fellowship that in

many instances a more or less complete disregard for the principles of ethics has been exhibited by individual members and that societies having original jurisdiction have failed to take proper action. The Constitution of the American Medical Association provides that the judicial power of the Association shall be vested in the Judicial Council and "shall extend to and include all questions involving Fellowship in the Scientific Assembly or the obligations, rights and privileges of Fellowship." The By-Laws provide that any member properly qualified by education and the payment of current annual Fellowship dues shall, on application, "be inducted into the Association as a Fellow unless the application is disapproved by the Judicial Council." The time of the Council at its meetings held in the interim between the annual meetings of the House of Delegates has been largely occupied in considering applicants for Fellowship about whom the biographic file of the Association contains some information which the Council feels must be satisfactorily explained before it can approve the application for Fellowship. The Council makes no "snap" judgments on these applications. The information appearing in the file is transmitted to the applicant, and he is asked to make any statement he desires to the Judicial Council, which is considering his application. When such statement is received, the matter is then fully investigated by correspondence, which often extends over a period of several months or even years. Frequently the applicant asks to be heard by the Council, which request is always granted. The persistence with which these applicants pursue their endeavors to become Fellows is the best evidence of the value that the profession in general places on Fellowship in good standing in the American Medical Association. Many such applications are disapproved. It also may be said, in passing, that reference to the constituent state or component county medical society where the applicant resides and practices in many instances fails to obtain any information or, in some instances, even a reply!

In these times of war with regulation of living, working, traveling, eating, spending, saving and almost everything except thinking, it is probably inevitable that the moral tone of the whole world has suffered to a greater or lesser degree. It could hardly be otherwise when we consider that the brutality of the present most destructive war of lives and property is in progress. The medical profession is less involved in this destruction than is the great percentage of the people of the world. Thus we should expect whether in peacetime or wartime.

We know that from the time of Hippocrates, the "Father of Medicine," the practice of the healing art has had ethical ideals and obligations higher than any other occupation or profession. It has always, since that time, been the duty of the physician to make the welfare of his patient his first consideration. That is the basic principle in our Principles of Medical Ethics. Every member of our organization is in duty, and by his own consent, bound by them, and those of our profession who are not members of our organization accept them as their guide to right action.

Very probably the maelstrom in which we are all living is confusing our morals, this also may explain the condition which the Council believes to exist, but it does not excuse it. It must always be remembered that the medical profession has gained and maintained its present position of high favor in public opinion through the exercise of these principles of right action through hundreds of years of growth since Hippocrates wrote his famous oath. Let us not, as individuals or as an organization, by either wilfulness, carelessness or indifference jeopardize the fair reputation our profession has built.

Respectfully submitted,

GEORGE EDWARD FOLLANSBEE, Chairman
JOHN H. O'SHEA
EDWARD R. CUNNIFFE
WALTER F. DONALDSON
LLOYD NOLAND

Report of Council on Medical Education and Hospitals

Dr. Charles Gordon Heyd, Acting Chairman, presented the report of the Council on Medical Education and Hospitals as presented in the Handbook, together with the following supplementary report, all of which was referred to the Reference Committee on Medical Education.

SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL EDUCATION
AND HOSPITALS ON ESSENTIALS OF ACCEPTABLE SCHOOLS

The Council on Medical Education and Hospitals presents herewith for ratification by the House of Delegates the following Essentials

1 Essentials of an Acceptable School for Clinical Laboratory Technicians The only change that was made was in the first sentence in the second paragraph under the heading III Faculty

2 Essentials of an Acceptable School for Physical Therapy Technicians These essentials have been completely revised

3 Essentials of an Acceptable School of Occupational Therapy These essentials have been completely revised

4 Essentials of an Acceptable School for Medical Record Librarians In June 1942 a resolution was introduced to the House of Delegates requesting that the American Medical Association inspect and approve or disapprove present and future schools for the training of medical record librarians This matter was referred to the Board of Trustees, which subsequently voted that the Council on Medical Education and Hospitals be asked to supervise the inspection of such schools In accordance with this request, the Council has now completed a survey of ten medical record librarian schools and has prepared Essentials of an Acceptable School for Medical Record Librarians which are submitted herewith for ratification by the House of Delegates

Respectfully submitted,

RAY LYMAN WILBUR, Chairman.

SOCIETY OF CLINICAL PATHOLOGISTS

PREAMBLE

Two organizations are primarily concerned with the training of clinical laboratory technicians the Council on Medical Education and Hospitals of the American Medical Association and the Board of Registry of Medical Technologists of the American Society of Clinical Pathologists The Council functions by inspecting, reporting and approving these schools while the Board of Registry investigates and certifies the competency of the technicians

The Council with the cooperation of the Board of Registry, has promulgated standards for this type of training for the information of physicians, hospitals, prospective students and others and for the protection of the public

Technicians are being trained in these schools to work under the direction of qualified physicians and not as independent practitioners of laboratory work

I ADMINISTRATION

1 Acceptable schools for training laboratory technicians may be conducted by approved medical schools¹ by general hospitals or by state health laboratories affiliated with hospitals where the majority of the student's practical training is received This arrangement should not discourage affiliations between the hospital and universities colleges public health laboratories or other hospitals

2 All training of technicians shall be under competent medical control

3 Sources for continued operation of the school should be insured through regular budgets gifts or endowments but not entirely through students' fees Experience has shown that com-

mmercial schools operated for profit frequently do not adhere to proper ethical and educational standards and therefore are not acceptable

II ORGANIZATION

1 Adequate space, light and modern equipment should be provided in the laboratory department A library containing up-to-date references texts and scientific periodicals pertaining to clinical laboratory work and pathology should be maintained, or be readily accessible to the institution

2 Satisfactory record systems should be provided for all work carried on in the department Monthly and annual classifications of the work of the department should be prepared

3 Transcripts of high school and college credits and other credentials must be available Records should be kept of each student's attendance and grades as well as the number and type of tests performed In addition a synopsis of the complete curriculum should be on file in the office of the laboratory director This curriculum should include the rotation of assignments, the outline of instruction supplied by the laboratory and a list of the prepared specimens which are used to augment the experiences of the student

4 At least two or more students should be enrolled in each class Approval is automatically withdrawn if a school does not have any students for a period of two years, unless a satisfactory reason for this is given

III FACULTY

1 The school should have a competent teaching staff The director must be a graduate in medicine who holds the certificate of the American Board of Pathology or who has had the equivalent in training and experience He shall take part in and be responsible for the actual conduct of the training course He shall be in daily attendance for sufficient time to supervise properly the laboratory work and teaching

2 In laboratory practice the enrolment should not exceed two students to each member of the teaching staff The staff should include not less than one salaried instructor who is a registered technician or eligible for registration, in addition to the laboratory director In order to be considered as an instructor, a technician must have had three years of experience while members of the hospital staff or visiting instructors must have regular assignments that cover a complete course prescribed in the Essentials

IV PREREQUISITES FOR ADMISSION

Candidates for admission should be able to satisfy one of the following requirements

(a) Two years of college work, including chemistry and biology from an accredited college or university

After Jan 1, 1943, this requirement shall read Two years of college work including general chemistry, quantitative chemistry and biology from an accredited college or university Bacteriology may be substituted for biology Organic chemistry and physics are highly recommended

(b) Graduation from a school of nursing recognized by the state board of nurse examiners and in addition college chemistry

After Jan 1 1943 requirements for nurses shall include one year of college work—30 semester hours (45 quarter hours)—including courses in chemistry and biology

V CURRICULUM

1 The course of training should be not less than twelve months in duration and should include the following subjects: biochemistry hematology bacteriology parasitology histology, and serology The training should also include a course in record keeping

2 The instruction should follow a planned outline similar to the Model Curriculum of the Board of Registry of Medical Technologists and should be accomplished by text assignments lectures or informal discussions demonstrations supervised practice quizzes and written oral and practical examination

¹ Ratified by House of Delegates in June 1942

VI CLINICAL MATERIAL

Each student should receive practice training, adequate in kind and amount, under competent supervision, in a hospital laboratory. The hospital should be registered and be otherwise acceptable to the Council on Medical Education and Hospitals of the American Medical Association and have a minimum of 2,000 yearly admissions. A sufficient amount of clinical material should be available to permit the student to comply with the requirements of the Board or Registry. If the hospital is not able to supply all of this material through its routine tests and examinations, artificial mediums should be provided.

VII ETHICS

1 Exorbitant fees and commercial advertising should be considered unethical.

2 Schools conducted primarily for the purpose of substituting students for paid technicians will not be considered for approval.

DEFINITION OF ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR PHYSICAL THERAPY TECHNICIANS PREPARED BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

I ORGANIZATION

1 Acceptable schools for training physical therapy technicians should be conducted by accredited universities, medical schools, colleges or hospitals.

2 The Council has promulgated standards for this type of training to supply physicians, hospitals and prospective students with reliable information and for the protection of the public.

3 Responsibility for schools in hospitals should be placed on the hospital administration rather than the director of the department. In colleges and universities this responsibility is on the controlling board as for other schools or departments.

4 Resources for continued operation of the school should be insured through regular budgets, gifts or endowments, but not entirely through students' tuition fees. Experience has shown that commercial schools operated for profit frequently do not adhere to proper ethical and educational standards and are not acceptable.

5 There must be available records of high school, college work and other credentials of students. Attendance and grades of students together with a detailed analysis of their clinical experience shall be carefully recorded, by means of which an exact knowledge may be obtained regarding each student's work.

6 At least four students should be enrolled in each class. One or more classes may be enrolled each year.

II FACULTY

7 The school should have a competent teaching staff. Appointments should be based on thorough education, training and experience. The course of instruction shall be under the direction of a graduate in medicine who is qualified in the field of physical therapy. The staff should include not less than one qualified salaried instructor and in each institution where clinical practice is carried on not less than one qualified physical therapy technician for each six students. The question of full time and part time appointments is not as important as the qualifications of the instructors, who should be specialists or exceptionally well trained and well qualified in the lines they are teaching.

III FACILITIES

8 Provision should be made for each student to receive clinical practice adequate in kind and amount under the supervision of a physician qualified in physical therapy in a hospital or other institution acceptable to the Council on Medical Education and Hospitals of the American Medical Association.

9 Adequate equipment should include anatomic charts, models and other aids to effective teaching. It is suggested that the student dissect at least a lateral half of the human cadaver or have the benefit of demonstrations of such dissections, supplemented by the use of the skeleton and disarticulated bones.

10 A library of adequate space and availability and containing up to date references, textbooks and scientific periodicals pertaining to physical therapy should be maintained.

IV ADMINISTRATION

11 There should be careful and intelligent supervision of the entire school by an executive officer who, by training and experience, is fitted to interpret the prevailing standards in physical therapy education, with sufficient authority to carry them into effect.

12 The admission of students to the physical therapy school must be in the hands of a responsible committee or examiner, whose records shall always be open for inspection. Documentary evidence of the student's preliminary education should be obtained and kept on file. When the physical therapy school is an integral part of the university, this work usually devolves on the university examiner.

V REQUIREMENTS FOR ADMISSION

13 Candidates for admission should be able to satisfy one of the following requirements:

- Graduation from an accredited school of nursing
- Graduation from an accredited school of physical education
- Two years of approved college training including satisfactory courses in biology and other sciences

Courses in general physics and chemistry, as well as biology, are highly recommended for all who seek to enter training in physical therapy.

14 Advanced standing may be granted to students for work done in other acceptable physical therapy schools or hospital departments, provided the entrance requirements and other essentials herein set forth have been met. Official verification of the student's previous physical therapy work should be obtained by direct correspondence with the schools previously attended, and his preliminary qualifications should also be verified and recorded in a similar manner as for the first year students.

15 Health—All applicants should be required to submit a physical health report including evidence of successful vaccination. All students should be given a medical examination under the supervision of the official school physician as soon as practicable after admission and this examination should include a roentgen examination of the chest.

VI PUBLICATIONS

16 The school should issue, at least annually, a bulletin setting forth its organization, resources, entrance requirements, tuition fees, clinical facilities, affiliated hospitals, a detailed description of the courses, and the names of the members of the faculty with their respective qualifications.

VII MINIMUM CURRICULUM

1 Length of Course—The minimum length of full time training for the course should be thirty-six weeks.

2 Distribution of Time

Subject	Clock Hours		Qualifications of Instructors
	Theory	Practice	
a Applied Sciences		210*	MD or other instructor qualified in specialty
Anatomy	30		
Pathology	30	45	
Physiology	15		
Psychology			
Physics	Correlated with other subjects		Qualified technician
b Procedures			
Electrotherapy	25	40	
Radiation therapy**	5	5	
Hydrotherapy	5	15	
Massage	10	45	Qualified technician
Therapeutic exercise	30	75	
c Physical Therapy as Applied to			MD for theory Qualified technician for practice
Medicine	15	30	
Neurology	10	15	
Orthopedics	15	30	
Surgery	15	30	
d Ethics and Administration	5		Qualified technician
e Electives		50*	MD and qualified technician
f Clinical Practice		400*	
Totals	210	660	330
	1,200 hours		

* Theory and Practice

** X-ray and Radium Therapy not included in course for physical therapy technicians.
Suggested electives: asepsis, bandaging, first aid, history of physical therapy, hygiene, joint measurements, journal club, public health, routine, occupational therapy records, social service.

3. ESSENTIALS OF AN ACCEPTABLE SCHOOL OF OCCUPATIONAL THERAPY PREPARED BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

PREAMBLE

Two organizations are primarily concerned with the training of occupational therapists—the Council on Medical Education and Hospitals of the American Medical Association and the American Occupational Therapy Association. The Council establishes standards, inspects and approves schools and publishes lists of acceptable schools. The American Occupational Therapy Association is concerned with the promotion of educational activities and the registration of qualified therapists.

The Council, in cooperation with the American Occupational Therapy Association, has established standards for this type of training for the information of physicians, hospitals, schools, prospective students and others, and for the protection of the public.

Therapists are being trained in these schools to work under the direction of qualified physicians and not as independent practitioners of occupational therapy.

I ORGANIZATION

1 A school of occupational therapy should be incorporated under the laws regulating nonprofit organizations. The control should be vested in a board of trustees composed of public spirited individuals having no financial interest in the operation of the school. The trustees should serve for reasonably long and overlapping terms. If the choice of trustees is vested in any other body than the board itself, this fact should be clearly stated. Officers and faculty of the school should be appointed by the board.

2 Affiliation with a college, university or medical school is highly desirable but is not an absolute requirement. When such an affiliation exists, an advisory committee should be established including representatives from the school and from the departments of the college, university or medical school which participate or cooperate in the teaching of occupational therapy.

3 Hospitals are required for clinical practice but should not attempt to operate a school of occupational therapy independently.

II RESOURCES

Experience has shown that an adequate school of occupational therapy cannot be maintained solely by the income from students fees. No occupational therapy school, therefore, should expect to secure approval which does not have a substantial additional income.

III FACULTY

The school should have a competent teaching staff, graded and organized by departments. The staff should include, among its regular salaried instructors, an administrator or coordinator of the course who should be a registered occupational therapist or eligible for registration preferably employed on a full time basis. In addition to professional training it is desirable that the administrator should possess an academic degree.

IV PLANT

1 The physical plant should provide adequate lecture rooms, class laboratories and administration offices. Equipment should be adequate for efficient teaching in the various departments.

2 A library of adequate space and availability and containing standard texts and leading periodicals in occupational therapy should be provided.

V ADMINISTRATION

1 Supervision—There should be careful and intelligent supervision of the entire school by a director or administrator with sufficient authority to maintain the established standards.

2 Records—There should be systematic records showing credentials, attendance and grades of the students.

3 Credentials—The admission of students to occupational therapy schools should be in the hands of a responsible committee or examiner. Documentary evidence of the student's preliminary education should be obtained and kept on file.

4 Advanced Standing—At the discretion of the administration, advanced standing may be granted for work (or experience) required in the occupational therapy curriculum which has been done in other accredited institutions. Official verification of

previous work (or experience) should be obtained by direct correspondence. Preliminary qualifications should also be verified and recorded.

5 Number of Students—The number of students admitted to the training course should be limited by the facilities of the school. In practical work of a laboratory nature the number of students that can be adequately supervised by a single instructor is, in general experience, about fifteen, in lectures the number may be larger. A close personal contact between students and members of the teaching staff is essential.

6 Discipline—Each training school reserves the right to drop a student at any time for any cause which the school authorities deem sufficient.

7 Publications—The school should issue, at least biennially, a bulletin setting forth the character of the work which it offers. Such an announcement should contain a list of the members of the faculty with their respective qualifications.

VI PREREQUISITES FOR ADMISSION

1 Education—Colleges offering training courses in occupational therapy which are combined with work leading to a bachelor's degree should require the candidates for this combined course to comply with the regular entrance requirements of the school concerned. Other candidates should furnish proof of having completed one year of college education or its equivalent.

2 Character—All candidates should be required to present evidence of good character, general fitness and emotional stability.

3 Health—All applicants should be required to submit a physical health report including evidence of successful vaccination. All students should be given a medical examination under the supervision of the official school physician as soon as practicable after admission and this examination should include a roentgen examination of the chest.

VII CURRICULUM

1 Length of Course—The minimum length of full time training for the course should be one hundred weeks. The course should include not less than sixty-four weeks of theoretical and technical instruction and not less than thirty-six weeks of hospital practice training as set forth in succeeding sections.

2 Distribution of Time—The period devoted to theoretical and technical training should include not less than sixty semester hours, of which not less than thirty semester hours should consist of didactic instruction and not less than thirty hours of technical instruction in therapeutic activities.

The curriculum should be so arranged that students placed in hospitals for practical training before the completion of their theoretical and technical instruction should have covered those portions of the curriculum which pertain to the clinical fields to which they may be assigned for practical instruction.

(a) Theoretical. The hours devoted to theoretical training should be still further subdivided as follows:

Required Subjects	Semester Hours
(1) Biologic Sciences to include Anatomy Kinesiology Neurology Physiology Psychiatry Psychology	15
(2) Social Sciences to include Sociology Individual Readjustment Social and Educational Agencies	4
(3) Theory of Occupational Therapy to include Interpretative courses covering the principles and practice of occupational therapy in relation to orthopedics, pediatrics, tuberculosis, psychiatry, general medicine and surgery and other special fields	4
(4) Clinical Subjects to include Blindness and Deafness Cardiac Diseases Communicable Diseases General Medical and Surgical Conditions Orthopedics Tuberculosis	4
(5) Electives	4
Total	30

(b) **Technical** Because of the increasing demands of the medical profession for qualified therapists trained in special fields applicable to the education and training of disabled persons as well as to the treatment of the sick, there should be a certain amount of flexibility in technical requirements.

A minimum of 30 semester hours should be devoted to technical training. The major portion of these thirty semester hours may be in one of the following fields, with survey courses in the other fields:

- (1) Arts—Fine and Applied Design, Leather, Metal, Plastics, Textiles and Wood
- (2) Education—Special and Adult, Home Economics and Library Science
- (3) Recreation—Music, Dramatics, Social Activities, Gardening and Physical Education

(c) **Clinical Training.** The time devoted to clinical training should be not less than thirty-six weeks in the following types of hospitals:

Mental hospitals	Not less than eight weeks
Tuberculosis sanatoriums or services	Not less than four weeks
General hospitals	Not less than four weeks
Children's hospitals or services	Not less than four weeks
Orthopedic hospitals or services	Not less than four weeks

The remaining twelve weeks optional.

VIII HOSPITAL AFFILIATIONS

1 Hospitals or institutions affiliating for clinical training should be carefully selected by the board of directors of the school concerned and be acceptable to the Council on Medical Education and Hospitals and should not be considered eligible for training of students unless the director of the occupational therapy department is a competent occupational therapist qualified to supervise students.

2 The occupational therapy director of each training department should be considered a member of the training school staff.

3 A well defined program of lectures, clinics or staff meetings should be offered by the hospital to all students in occupational therapy affiliating with the hospital. This should be supplementary to the required theoretical and technical courses given in the school.

4 Written records and case studies must be submitted by each student. Students must obtain satisfactory rating in clinical training before a diploma is granted.

5 The occupational therapy director should maintain records especially covering the student's personal adjustment and general ability. Copies of these records should be sent to the school at frequent intervals and all reports filed in the individual student's record at the school.

METHOD OF APPLICATION

Application for approval of occupational therapy schools should be submitted to the Council on Medical Education and Hospitals of the American Medical Association, 535 North Dearborn Street, Chicago. Inquiries regarding the registration of qualified therapists should be addressed to the American Occupational Therapy Association, 175 Fifth Avenue, New York.

4 ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR MEDICAL RECORD LIBRARIANS

PREAMBLE

There are two organizations primarily concerned with the training of medical record librarians. These are the Council on Medical Education and Hospitals of the American Medical Association and the American Association of Medical Record Librarians. The Council establishes standards, inspects and approves schools and publishes a list of acceptable schools. The American Association of Medical Record Librarians is concerned with the promotion of educational activities and the registration of qualified librarians.

The Council with the cooperation of the American Association of Medical Record Librarians has established the following standards for the information of schools, hospitals, prospective students, physicians, educational directors and for the protection of the public.

I ADMINISTRATION

1 Acceptable schools for the training of medical record librarians may be conducted by general hospitals having adequate teaching material and personnel which will be described in succeeding sections. Approval may also be extended to colleges, universities and medical schools having suitable hospital facilities.

2 Resources for the continued operation of acceptable schools should be available through regular budgets, gifts or endowments but may be obtained in part through students fees. Schools charging exorbitant fees or indulging in commercial advertising are considered unacceptable.

3 Training in the handling of records should be under the direction of a qualified medical record librarian.

4 Schools conducted primarily for the purpose of substituting students for paid librarians will not be considered for approval.

II ORGANIZATION

1 Adequate space, light and equipment should be available for the general and educational activities of the hospital departments used in the training of medical record librarians. A library containing current references, textbooks and periodicals pertaining to the work of medical record librarians should be readily accessible to the students.

2 The medical record library should maintain serial and alphabetic files of patients' records, statistical data on births, deaths and autopsies, diagnostic and operative classifications and physicians' index. A modern system of classification should be employed with supplemental classifications and files for teaching and demonstration purposes. Such files should include serial and unit number systems, phonetic classifications, Standard Nomenclature of Disease, Standard Nomenclature of Operations and other acceptable classifications.

3 A record of the curriculum, teaching plans and a procedure book should be available. Records of the students' prerequisite training should be filed in the department. To these should be added the details of attendance and grades as well as a list of the experiences obtained by individual students.

4 A minimum of two students should be in training. However, the maximum number admitted for practical instruction should be determined by the amount of available space, teaching material and properly qualified instructors.

III FACULTY

1 A competent teaching staff should be supplied by the school. Its director shall be responsible for the actual conduct of the training course and shall devote sufficient time for proper supervision of the students. An adequate number of instructors should be available so that students may have immediate guidance and supervision in all of their assignments.

IV PREREQUISITES FOR ADMISSION

Candidates for admission should be proficient in typing and shorthand and in addition should fulfil one of the following requirements:

- (a) Completion of two academic years of study in a college of liberal arts approved by a recognized accrediting agency.
- (b) Graduation from a school of nursing recognized by a state board of nurse examiners.

V CURRICULUM

1 The course of training should include not less than thirty-six weeks of practical hospital experience.

2 Theoretical instruction may be presented by informal conferences or formal lectures and should include the following:

Anatomy and physiology	60 clock hrs
Medical terminology	25 clock hrs
Hospital and medical ethics	20 clock hrs
Fundamental principles and practices of medical record library science	50 clock hrs

3 Practical training should involve all activities associated with the care of medical records. This should include the filing of records, the mechanism of admission and discharge of patients, the methods of cataloguing, medical dictation, observation of clinical procedures and dictation, and outpatient department records. Sufficient time should be devoted to each

assignment so that students may become familiar with all functions of the medical record library. Additional experience in the handling of records in the pathology and radiology departments is recommended. To augment the training program field trips should be arranged when possible to visit other hospitals and study their record library equipment and methods.

VI CLINICAL MATERIAL

1 In order to be eligible for acceptance the general hospital where training is obtained should be registered and otherwise acceptable to the Council on Medical Education and Hospitals and have a minimum of six thousand annual admissions. These admissions should include an adequate distribution of patients in the various clinical services commonly found in general hospitals. If adequate facilities are not available, affiliations may be established with other hospitals to supplement clinical record instruction in such special fields as mental diseases, tuberculosis and outpatient service.

VII ADMISSION TO THE APPROVED LIST

1 Application for approval of a school for medical record librarians should be made to the Council on Medical Education and Hospitals of the American Medical Association, 535 North Dearborn Street, Chicago, Ill. Forms will be supplied for this purpose on request. They should be completed by the administrator of the institution requesting this approval.

2 Approval may be withdrawn whenever in the opinion of the Council a school does not maintain an educational service in accordance with the above standards. Whenever a training program has not been in operation for a period of two consecutive years, approval may also be withdrawn.

Report of Council on Scientific Assembly

Dr. A. A. Walker, Chairman, presented the report of the Council on Scientific Assembly as printed in the Handbook which was referred to the Reference Committee on Sections and Section Work.

Report of Committee on War Participation

Dr. Walter F. Donaldson, Chairman, presented the following report, which was referred to the Reference Committee on War Participation:

To the Members of the 1943 House of Delegates American Medical Association

The War Participation Committee of the American Medical Association originated from the report of the 1941-1942 Committee on Medical Preparedness to the 1942 House of Delegates of the American Medical Association. The latter committee suggested that it be discontinued and a new committee created for the purpose of keeping in close touch with all war related policies affecting the quality and efficiency of medical service both to the armed forces and to the civilian population.

The accomplishments of the American Medical Association Committee on Medical Preparedness from June 1940 to June 1942 under the chairmanship of former President Irvin Abell will throughout the years reflect great credit on the entire Association as an outstanding voluntary contribution by the organized medical profession to the winning of World War II.

Paced by Dr. Abell's American Medical Association committee, the constituent medical associations served equally well their country's war needs through the instrumentality of similar committees as did hundreds of component county medical societies.

Since the summer of 1942 medical activities throughout the states and territories of the Union have been succeeded by the now familiar task of the Procurement and Assignment Service contributed usually by the same personnel which earlier served so well under Medical Preparedness.

The heavy responsibilities of the Procurement and Assignment Service as earlier known have become more complex with doubled accent on the accessibility of adequate medical service to war industries, to thinly populated districts and to essential institutions. Since the Federal Manpower Commission has invited the Procurement and Assignment Service under the chairmanship of former President Frank H. Lahey, Dr. Lahey has twice turned to the American Medical Association War Participation Committee for cooperation. Similarly the Procurement and Assignment Service in the various states may

turn to the State Medical Society War Participation Committee and doubtless the response will be prompt and understanding.

In our committee's communications the functions of the War Participation Committee of a constituent state medical association were recommended as follows:

The proposed Committee on War Participation should keep in close touch with all policies affecting the quality and efficiency of medical service both to the armed forces and to the civilian population.

It should feel free to express comments and criticism of policies relating to the participation of the medical profession in the war effort.

Without authority to act only to advise it becomes a committee to express the views of the medical profession on such proposals as are made which may have a direct bearing on the Principles which the American Medical Association regards as fundamental in the provision of good medical care.

A War Participation Committee should at all times encourage and support to the fullest wise proposals to sustain the highest possible quality and efficiency of medical service both to the armed forces and to the civilian population, not failing at the same time to be looking to the situation in the years immediately following the determination of peace.

Obviously, a War Participation Committee may serve well at times by asking pertinent questions of all those in authority who during the war emergency (1) may seek disposal of precious medical service or (2) may be assigned control of medical education and training.

Avoiding impertinent and asking only pertinent questions will not in any way interfere with the winning of the war. Our own committee held its first meeting at the American Medical Association headquarters on Aug. 18, 1942 for the purpose of discussion with a subcommittee of the Procurement and Assignment Service headed by Dr. Clarence D. Selby of Detroit. The topic of Industrial Medicine sparked by the remarks of Commissioner Paul V. McNutt before the 1942 House of Delegates at its Atlantic City session led to the conference of August 18 which was participated in by representatives of the Board of Trustees of the American Medical Association, the Council on Medical Education and Hospitals and the Council on Industrial Health. At the conclusion of the discussion the Committee on War Participation requested the Association through its Council on Industrial Health to continue its pace making lead in connection with the profession's contribution to the winning of the war through its organizational and individualized efforts at keeping war workers well. After this meeting our committee with the aid of Secretary Olin West made an effort to encourage the development of war participation committees in the various state associations for the purpose not only of stimulating the endeavors toward keeping war workers well but of cooperating with the Procurement and Assignment Service to meet the needs for medical care in all communities where shortage of physicians is demonstrable. It is a pleasure to be able to confirm published reports indicative of the great progress made in a considerable number of states in the spread of instruction in industrial medicine at county levels.

The second meeting of the War Participation Committee of the American Medical Association was held in Washington, D. C. with the directing board of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians and with representatives of the United States Public Health Service on Dec. 14, 1942. Plans were presented whereby the United States Public Health Service could help to meet the need for medical services in so-called critical areas. At that conference the War Participation Committee of the American Medical Association recommended that state medical societies cooperate with the State Procurement and Assignment Service and with the state boards of registration and licensure in determining areas that lack medical services and in developing plans for medical services in such areas when the need arises.

A proposed statement of operating policy submitted by Surg. Gen. Thomas Parran of the United States Public Health Service was after discussion and some alteration unanimously adopted and reads as follows:

The Public Health Service and the Procurement and Assignment Service will jointly undertake studies of war industry and extra cantonment areas from which shortages of medical and allied professional personnel are feared. These studies shall be made jointly by the appropriate corps area chairman or P. & A. state medical and dental chairman of P. & A. and representatives of U. S. P. H. S. either

the district director or some one detailed by the district director or by the Surgeon General. Also the state medical society and the state health department each will be invited to designate a representative to participate in such studies as will, where needed, the state dental society.

In a number of states the problem of supplying medical service in new war defense or war industry areas, or in rural areas denuded of medical service through the entry of practicing physicians into the armed forces, has, throughout much of the year 1943, been a serious one. Representatives of the U. S. Public Health Service have been helpful in the making of surveys confirmatory of localized needs for additional medical service, is submitted by the citizenry or by industries. Doubtless, in many instances, these needs will be filled by medical personnel recommended by the U. S. Public Health Service.

This type of cooperation has been consolidated in at least one state by the inclusion in act No. 15 of its 1943 legislature of a provision for the issuance of temporary permits to doctors of medicine legally licensed in other states to practice medicine and surgery under certain conditions for a limited period of time. We quote from said act:

The provisions of this act are intended to supply medical services communities where because of the drain of war needs on such services that are normally available there exists a need for medical services that may become a threat to public health. In order that this purpose shall be most effectively carried out the Board of Medical Education and Licensure in applying the provisions of this act shall cooperate with the Procurement and Assignment Service in Pennsylvania of the War Man Power Commission and with the committee on War Participation of the Medical Society of the State of Pennsylvania and shall give due consideration to the recommendation of either of such agencies.

A difficulty in the provision of adequate medical service in a number of critical areas seems to have arisen from the desire of other physicians in a given county that the physician newly locating in such an area will do so on a locum tenens rather than on a permanent basis, against the day of the return of the absent soldier-physician to his home practice.

The spirit of all home front doctors of medicine who thus condemn that which they may interpret as the selfishness which inspires a doctor to leave or to pass over a community which needs his professional services during this emergency, in order to relocate in a more promising community, is to be commended, provided in each instance full consideration with material results is first given to meeting the actual and existing health and sickness service needs of such a community.

Our committee is greatly indebted to the representatives of thirty-eight constituent state medical associations that responded to the committee's brief questionnaire addressed to them last April. From these replies it is evident that a large percentage have assigned the duties of their respective war participation committees to the preexisting committee on medical preparedness or Procurement and Assignment Service, without change of title or personnel. In some states, and in a larger proportion of counties, it is feared that the current War Participation Committee personnel, heavily engaged, possibly since 1940, in meeting the responsibilities of a committee earlier known as the Committee on War or on Medical Preparedness with its manifold duties, or later as the Committee on Procurement and Assignment Service equally heavily involved in specific duties, is likely to overlook some of the more generalized responsibilities of a War Participation Committee as defined by the 1942 House of Delegates of the American Medical Association.

Should we not be sure in each instance that the more definite duty of indicating which local or state physicians are believed to be "available" for service with the armed forces, or, on the contrary, are "essential" to home service, that a committee with combined duties may not be overlooking, for instance, the purely advisory duties of a War Participation Committee? Aside from direct war needs proposals are being made from time to time which have a direct bearing on the principles which the American Medical Association has for many years regarded as fundamental in the provision of good medical care to the 100 million people of this country who up to the present time are not directly employed in federal projects of combat, of farming or of industry, or in any other way specifically connected with the war effort.

Shall we not give consideration to definite organizational and individual responsibilities through War Participation Com-

mittees of nation, state and county directed toward helping the public to learn the truth about bureaucratic tax supported medical service in order that they may eventually eliminate its evils? This will require of each of us a rigorous knowledge of the truth and a considerable expenditure of effort. However, the necessity is so great, and the adverse consequences may prove so bitter for the people, even more than for the physician, that such leadership becomes our solemn duty.

Does it seem a far cry to discuss this particular duty while representing a War Participation Committee? The advisory function of such committees applies to the protection of adequate medical service for the civilian population and surely no federal commitment to regimented medicine should be made during the nation's war effort or while upward of fifty thousand of our younger colleagues are absent and serving with the colors.

Nominations for Affiliate Fellowship

The Secretary presented nominations for Affiliate Fellowship, which were referred to the Council on Scientific Assembly.

Visitors from Brazil

The Secretary announced the attendance of the following visitors from Brazil: Dr. Mario Kroeff of Rio de Janeiro, Dr. August W. Koenig of Rio de Janeiro, Dr. Nelson Guedes Muniz of Rio de Janeiro and Dr. A. L. Cancado and Dr. D. M. Cardozo, the first of Rio de Janeiro and the second of São Paulo.

NEW BUSINESS

Resolutions on Giving Intelligent Instruction in Science and Biology to the Youth of America

Dr. F. G. Borzell, Pennsylvania, presented the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health.

During the last few decades the United States has witnessed the paradox of tremendously increasing knowledge and its applications in all fields of science along with steadily diminishing teaching of the principles and practices of science in our high schools. Many scientists and teachers of science have noted, written and spoken about this inconsistency.

The diminution in the teaching of sound biology in high schools to a near vanishing point in many schools is shown in data compiled in reports by a committee appointed for a survey by the Union of American Biological Societies.

Study of these data shows that the places of science in general and biology in particular have been taken by other subjects, many of which come under the head of "social studies." Most of the subject matter in these studies is of highly controversial nature. Both the yes and nay are equally derivable by emotional argumentation. There is no arbiter except "authority" notorious for its unreliability and changeability. Many of these subjects afford a false discipline for unformed minds in methods of study and learning for they present half truths, deceptive, elusive or entirely nonexistent statements and relations.

It is believed, therefore, that the organized medical profession of the country should adopt means of cooperating with the teachers of science, particularly biology, in endeavors to restore the teaching of science to its proper place in the high schools. With a sound background of biology the essential teaching of health topics will be on a sound basis and therefore more effective.

WHEREAS, The appropriate teaching of biology in the secondary school is essential to child's nutrition, his health and adaptability to changing environment, and

WHEREAS, The source of medical knowledge is logically the medical profession, therefore be it

Resolved, That the American Medical Association endorse the principle that every child in the United States be given four years of sound instruction in science with at least two years of biology in high school, and be it further

Resolved, That the American Medical Association through its Bureau of Health Education encourage close cooperation between the constituent state medical associations and the component county medical societies and the teachers of science in their respective communities to the end that intelligent instruction in science and biology be given the youth of America.

Resolution on Having Copies of the Boy and Girl Scouts' Manual in Physician's Waiting Rooms

Dr. James Q. Graves, Louisiana, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business.

WHEREAS, The House of Delegates of the Louisiana State Medical Society has adopted favorably a recommendation that members of the Louisiana State Medical Society have a copy of the boy and girl scouts manual in their waiting rooms therefore be it

Resolved, That the House of Delegates of the Louisiana State Medical Society respectfully have the Louisiana delegates request the House of Delegates of the American Medical Association to adopt a similar resolution in regard to members of the American Medical Association.

Resolutions Establishing a Committee on Medical Service

Dr W A Coventry, Minnesota, in behalf of the delegates from the Minnesota State Medical Association, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations

WHEREAS The medical profession is conscious of its responsibilities in providing timely and adequate medical services to all of the American people, irrespective of race, creed or financial status and

WHEREAS It believes it to be its duty and right to make available scientific facts data and medical opinion with respect thereto and to make known the role that the science and art of medicine plays in the daily lives of all Americans and

WHEREAS The medical profession of the United States is ready to offer constructive leadership in the advancement of medical principles that will further medical service to all of the people and to preserve not only the science and art of medicine but the standards associated with the practice of medicine in America now therefore be it

Resolved That there is hereby created by this House of Delegates a Committee on Medical Service which shall be composed of the following members

- 1 The President of the American Medical Association ex officio
- 2 The Immediate Past President of the American Medical Association
- 3 The Secretary of the American Medical Association ex officio
- 4 A member of the Board of Trustees of the American Medical Association designated and selected by the Board of Trustees
- 5 One member of the American Medical Association elected as hereinafter provided from each of the following nine geographic subdivisions of the United States

New England Maine New Hampshire Vermont Massachusetts Rhode Island and Connecticut Middle Atlantic New York Pennsylvania and New Jersey East North Central Ohio Indiana Illinois Michigan and Wisconsin South Atlantic Delaware Maryland District of Columbia Virginia West Virginia North Carolina South Carolina Georgia Florida and Puerto Rico East South Central Kentucky Tennessee Alabama and Mississippi West South Central Arkansas Louisiana Oklahoma Texas and Panama Canal Zone West North Central Minnesota Iowa Missouri North Dakota South Dakota Nebraska and Kansas Mountain Montana Idaho Wyoming Colorado New Mexico Arizona Utah and Nevada and Pacific Washington Oregon California Alaska Hawaii Philippines and Pacific Islands

The members of this House of Delegates from each of the foregoing geographic subdivisions of the United States shall elect one member of the American Medical Association to serve on said committee three of said nine members shall serve for one year three shall serve for two years and three shall serve for three years the respective terms of office of the nine members first elected shall be decided by lot and thereafter the said terms shall be for three years each The expiration date for the first one year term shall be at the next ensuing annual session of the House of Delegates of the American Medical Association Expiration dates for all terms shall coincide with the dates of the regular annual session of the House of Delegates of the American Medical Association be it further

Resolved That the duties of the Committee on Medical Service shall be

1 The making available of scientific facts and data and medical opinion with respect to timely and adequate rendition of medical care to the American people

2 To integrate the activities of the Committee on Medical Service with respective state and county committees on like activities

3 Establish relationships and cooperation with other allied groups who are likewise engaged in the rendition of medical care in its various branches to the American people

4 The Committee on Medical Service shall hold at least two meetings per year one shall be held at the time and place of the annual meeting of this House of Delegates the other meeting shall be held in the city of Washington D C and called at the direction of the chairman and such other meetings as may be necessary to be called by the chairman on the written request of the majority of the committee

5 The committee shall forthwith and annually thereafter elect from its own membership a chairman and a vice chairman

6 The Committee on Medical Service shall establish and maintain an office in Washington D C and shall further be empowered and directed to employ a full time executive director who shall act as secretary of the committee and whose duties shall be specified by the committee Such executive director shall be a physician who has been actively engaged in the private practice of medicine for not less than five years during the previous ten years and furthermore be informed and qualified to act as a liaison representative of said committee

The Committee on Medical Service is further authorized to hire such legal and administrative help as is necessary be it further

Resolved That the Committee on Medical Service shall submit a budget for its expenses for the fiscal year to the Board of Trustees of the American Medical Association and it is the consensus of opinion of this House of Delegates that the Board of Trustees shall forthwith appropriate not less than 20 cents nor more than 1 dollar for each member of the American Medical Association so that adequate funds will be available for such committee to carry out its work on an honorable and ethical plane in keeping with the standards of American medicine be it further

Resolved That this committee shall submit an annual report to the House of Delegates at the annual session and be it further

Resolved That these resolutions on their adoption by the House of Delegates shall be forthwith transmitted to the Board of Trustees with the request that the Board of Trustees report back its action to the House of Delegates within twenty four hours as provided for in the Constitution and By Laws of the American Medical Association

Resolutions Requesting the Establishment of a Council on Medical Care

Dr E H Skinner Section on Radiology, presented the following resolutions, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws

WHEREAS The medical profession is conscious of its responsibilities in providing timely and adequate medical services to all of the American people irrespective of race creed or financial status and

WHEREAS It believes that its duty and right is to make available scientific facts data and medical opinion with respect thereto and to make known the role that the science and art of medicine plays in the daily lives of all Americans and

WHEREAS The medical profession of the United States is ready to offer constructive leadership in the advancement of medical principles that will further medical service to all of the people and to preserve not only the science and art of medicine but also the standards associated with the practice of medicine in America now therefore be it

Resolved That section 3 of chapter VII of the By Laws shall be and hereby is amended by adding thereto a new paragraph to be designated as paragraph (d) reading as follows (d) Council on Medical Care and be it further

Resolved That chapter IX of the By Laws shall be and hereby is amended by adding thereto a new section to be numbered section 4 reading as follows

SEC 4 COUNCIL ON MEDICAL CARE—The functions of the Council on Medical Care shall be (1) to take over all the functions and personnel of the Bureau of Medical Economics as now established (2) to investigate all matters pertaining to the economic social and public policy aspects of medical care for all citizens (3) to suggest means and methods for the distribution of medical services to the public consistent with the principles adopted heretofore and hereafter by the House of Delegates (4) to execute other functions which may from time to time be delegated to such Council by the House of Delegates (5) to develop assist and coordinate committees on Medical Care and Public Policy originating within the state and county societies of the American Medical Association (6) in cooperation with the Board of Trustees to establish and maintain a Bureau of Information on Medical Services at Washington D C and be it further

Resolved That the membership shall be nine in number elected as hereinafter provided from each of the following districts New England Maine New Hampshire Vermont Massachusetts Rhode Island and Connecticut Middle Atlantic New York Pennsylvania and New Jersey East North Central Ohio Indiana Illinois Michigan and Wisconsin South Atlantic Delaware Maryland District of Columbia Virginia West Virginia North Carolina South Carolina Georgia Florida and Puerto Rico East South Central Kentucky Tennessee Alabama and Mississippi West South Central Arkansas Louisiana Oklahoma Texas and Isthmian Canal Zone West North Central Minnesota Iowa Missouri North Dakota South Dakota Nebraska and Kansas Mountain Montana Idaho Wyoming Colorado New Mexico Arizona Utah and Nevada and Pacific Washington Oregon California Alaska Hawaii Philippines and Pacific Islands

The members of this House of Delegates from each of the foregoing geographic subdivisions of the United States shall elect one member of the American Medical Association to serve on said committee three of said nine members shall serve for one year three shall serve for two years and three shall serve for three years the respective terms of office of the nine members first elected shall be decided by lot and thereafter the said terms shall be for three years each The expiration date for the first one year term shall be at the next ensuing annual session of the House of Delegates of the American Medical Association Expiration dates for all terms shall coincide with the dates of the regular annual session of the House of Delegates of the American Medical Association

Resolutions Giving Public a Voice in House of Delegates and Establishing a Bureau of Medical Care

Dr F S Crockett Indiana, presented the following resolutions which were referred to the Reference Committee on Legislation and Public Relations

The Council of the Indiana State Medical Association directs its delegates to present the following communication to the House of Delegates of the American Medical Association calling attention to the serious situation confronting the medical profession and suggesting remedies. Evidence of this situation not alone are found in Indiana but are manifest in nearly all sections of the country

Throughout the rank and file of the profession there are many who feel that this House of Delegates has failed in large measure to reflect truly the wishes and thinking of the profession nor have they been sparing in their comments in reference to the Trustees and other executives of this Association Causes underlying this feeling are many The past decade has witnessed a gradual encroachment of government in the field of medical practice which our leadership has been unable

to stem. Witness the loss of the Supreme Court decision, the report of the Pepper committee and the criticism of a powerful section of the press to mention only a few.

In the minds of many who are not actively connected with the conduct of this Association we have been and are continuing to be defeated in our efforts to preserve our way of life. As these defeats continue, the demand for new leadership will increase. Reference is here made to an editorial appearing in the May issue of *Medical Journals of the District of Columbia* which says in part: "What the profession as a whole needs at this time above anything else is leadership which inspires confidence—able constructive leadership. It needs the confidence which is inspired by elected leaders who can speak for them effectively without arousing unnecessary antagonisms. It needs in its national organization a quicker response to the heart beat of the doctors and the times. It needs the elimination of reactionary tendencies at the top."

In the past this House and the Board of Trustees have on occasion shown vision and leadership of a high order such as its adoption of Principles for Medical Care in 1939 and the Military Preparedness program at the New York session. To meet the rising tide of public criticism some way should be provided to give the public a voice in the deliberation of this House. That voice might be that of some individual of national standing, whose wise counsel could share in molding the future of medicine in harmony with sound public policy. Whereas the Board of Trustees is an executive not a policy making body, the interpretation of policy which is a function of the board is influenced profoundly by the liberal or conservative thinking of its members. This phenomenon has been observed repeatedly in the past whenever new members are elected. There are many duties of the Board which are solely the concern of the Association but there are occasions when a voice reflecting the lay public mind in interpreting policy would be extremely valuable.

Some 40,000 of our most active members are temporarily in the armed forces. The hasty mobilization of such members has created many situations needing correction which the usual military channels seem inadequate to solve. These officers are members of this Association who expect to return to civilian practice. They properly look to us for sympathetic understanding.

It is proposed that a military morale unit be created by this Association with the consent and approval of the Office of the Surgeon General of each service. This unit should be headed by some nationally known physician who should have the confidence of the men in service and who could speak for the American Medical Association. He should have a staff of capable assistants visit military medical establishments at home and abroad and be able to talk to any medical officer free from military restraint. All complaints should be analyzed carefully and placed before the appropriate authority with suggestions for correction.

The Bureau of Medical Economics has done a fine job. It should now be made the Bureau of Medical Care. It should include the ablest economist obtainable who should be able to give the public, in their language, sound information on medical care problems. The problem of medical care requires attention now. The plan should be something that will enlist the active interest and participation of all citizens.

The plan endorsed by this House at San Francisco in 1938 proposed community action covering a wide variety of health activities, preventive and educational. It was a plan wherein each community would be encouraged to develop its own program suitable to the local needs. This plan brought up to date to meet present conditions can serve as a basis for a nationwide medical program.

The Bureau of Medical Care should establish a council or committee to rate communities according to their achievements in the preventive medical field just as the Council on Medical Education and Hospitals rates medical schools and hospitals for intern training. Communities outstanding in their preventive activities and results might receive some sort of award like the Army and Navy Es, given for excellence in production of military supplies. The ceremonies incident to giving these awards might be the background for a civic celebration that would make the public appreciate the splendid job being done by the profession under the aggressive leadership of this Association and the state medical societies in cooperation with the local profession.

Another important factor in improving our standing with our federal government would be the maintenance in Washington of an office for the convenience and information of Congress, manned by some one capable of representing the best in medicine. Proposed legislation affecting the interest of the medical profession directly and indirectly is being introduced into Congress with increasing frequency, and executive bureaus, commissions and other instrumentalities of the federal government issue rulings many of which may affect the practice of medicine.

In line with the facts and suggestions just enumerated we submit to this House of Delegates the following resolutions:

Resolved That some provision be made whereby the lay public should have a voice in the deliberations of this House and in the Board of Trustees, wherever the public interest is involved,

Resolved, That a military morale unit be created with the consent and approval of the Office of the Surgeon General of each service, to visit military medical establishments at home and abroad to help in solving difficulties experienced by our members in service,

Resolved, That a Bureau of Medical Care be established to encourage communities in all the states to cooperate with their state and local medical societies in developing health movements covering the field of preventive, corrective and educational activities, and

Resolved, That the Bureau of Legal Medicine and Legislation be enlarged to enable the maintenance in Washington of some one capable of representing this Association who will be available at all times for the purpose of supplying information and developing better relations with Congress and other branches of our federal government.

Dr. A. A. Walker, Alabama, suggested that resolutions be read without preliminary speeches.

Recommendation Requesting Establishment of a Legislative Bureau of the American Medical Association in Washington

Dr. Wells P. Eagleton, New Jersey, presented the following recommendation, which was referred to the Reference Committee on Legislation and Public Relations:

With respect to the recommendation about to be introduced on behalf of the New Jersey delegation, we should mention that immediately following the annual meeting of the Medical Society of New Jersey held May 25 and 26, and pursuant to a resolution adopted at this meeting, a letter from the secretary of our society, containing the resolution regarding the establishment of a legislative bureau of the Association in Washington, together with a brief in support of this proposal was sent to all of the listed Delegates of the Association, and since our arrival we have attempted to place in the hands of the other Delegates the material referred to.

We shall reserve further arguments in support of this proposal for the hearing before the reference committee, but we should like to emphasize that in making this recommendation it is not to be assumed that this in any wise is a reflection on the Bureau of Legal Medicine and Legislation. We believe from our experience and our relations with this Bureau that it is doing an excellent job within the setup now existing. The Legislative Committee of the Medical Society of New Jersey is particularly appreciative of the fine cooperation given by the Director of the Bureau, Mr. Holloway, in relation to some of our state problems, and has a high regard for his ability and judgment.

In referring this recommendation we should appreciate it if the Speaker will permit these remarks to be attached.

Resolutions Supporting Establishment of Committee on Medical Service

Dr. Karl S. J. Hohlen, Nebraska, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, A resolution will be introduced in the House of Delegates of the American Medical Association during the annual assembly convening June 7, 1943 in Chicago which provides for the creation of a committee to be known as the Committee on Medical Service, and

WHEREAS, The House of Delegates of the Nebraska State Medical Association in annual assembly May 4, 1943 is heartily in accord with the principles expressed in that resolution, therefore be it

Resolved That the house of delegates of the Nebraska State Medical Association urge the House of Delegates of the American Medical Association to adopt the resolution, be it further

Resolved, That the Constitution and By Laws of the American Medical Association be amended, if necessary, in order that the above mentioned resolution can be adopted, and be it further

Resolved That the delegates of the Nebraska State Medical Association to the House of Delegates of the American Medical Association are hereby instructed to do all in their power to effect the adoption of the resolution and, if necessary, amend the Constitution and By Laws.

Resolution Requesting Changes in Administration of Federal Security Law so as to Assure Payment of the Physician

Dr. Walter P. Anderton, New York, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Experience in New York State has shown that doctors rendering authorized care to recipients of relief in those categories which are covered by federal reimbursement regulations are in many cases particularly in old age assistance, not receiving payment for their services because of the failure of the recipients of such services to pay to the physicians the money given them for such payment, and

WHEREAS, The house of delegates of the Medical Society of the State of New York has gone on record as favoring such changes in the administration of the Federal Security Law as are necessary to assure payment of the physician, and

WHEREAS, The house of delegates of the Medical Society of the State of New York has gone on record as requesting the aid of the American Medical Association, therefore, be it

Resolved That the House of Delegates of the American Medical Association memorialize the proper authorities to secure such changes in the administration of the Federal Security Law as are necessary to assure payment of the physician.

Resolutions Requesting Establishment in Washington, D. C., of Office of Information of American Medical Association

Dr. Arthur S. Risser, Oklahoma, introduced the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The American Medical Association is the parent organization of all state medical associations and is therefore looked to for leadership by the public in matters pertaining to health and welfare and

WHEREAS, The office of the American Medical Association and its executive officers are located in Chicago, Illinois, and therefore it is

easily accessible to the Congress of the United States and other departments of the federal government dealing with matters of health for the people now therefore be it

Resolved By the house of delegates of the Oklahoma State Medical Association that its delegates be instructed either to introduce or to support a resolution such as that proposed by the National Conference on Medical Service and the Federated Medical Boards of Examiners, which will establish an office of information of the American Medical Association in Washington D C with full time personnel in attendance in order that the Congress and bureaus of the federal government may have the advice and guidance of the American Medical Association on health legislation at all times it is further

Resolved That the delegates of the Oklahoma State Medical Association to the American Medical Association be instructed to work to the end that any committee council bureau or board appointed by the Board of Trustees of the American Medical Association to act in an advisory capacity to a Bureau of Information in Washington D C be of sufficient size to have representation on it of physicians taken from geographic localities of the United States and that these physicians be in the majority to any other physicians appointed to a committee council bureau or board and it is still further

Resolved That any appointments to any committee council bureau or board by the Board of Trustees be made on the recommendations of the delegates from the states represented in the different geographic divisions

Resolutions Expressing Approval of Federal Assistance to Wives and Children of Service Men as Outlined in Plan Under Consideration by Federal Childrens Bureau

Dr John H Iitzgibbon Oregon presented the following resolutions which were referred to the Reference Committee on Legislation and Public Relations

Resolved That approval be expressed of federal assistance to the wives and children of service men as outlined in the plan under consideration by the Federal Childrens Bureau provided however that the constituent state medical associations which are members of the Pacific States Medical Executives Conference be requested to consider carefully the merits of the procedure proposed by the Oregon State Medical Society wherein any allocations for professional services agreed on as compensation for obstetric work involved shall be given to the wives of enlisted men such patients then to secure the services of physicians as they themselves deem proper the fee for professional services to be decided by mutual agreement between the patients and the attending physicians and

Resolved That the conference secretary send outlines of the Oregon plan to the constituent state associations and further

Resolved That the suggestion be made that a special committee composed of representatives of the Pacific states medical associations be brought into being if possible to consider further the aforementioned Oregon plan

Resolution Urging the Creation of a Federal Department of Health

Dr Thomas A McGoldrick New York introduced the following resolution which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS Coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives and

WHEREAS The problems of medical care could best be coordinated and correlated under the guidance of a central agency be it

Resolved That the American Medical Association urge with all the power at its command that a federal Department of Health be created to be headed by a Secretary of Health who shall be a properly qualified doctor of medicine who is a member of a component county medical society

Resolution Approving Proposed Changes in Regard to Medical Services of the American Red Cross in Disaster Relief

Dr Arthur T McCormack Kentucky presented the following resolution which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS This Association approved the policies of the American Red Cross in disaster relief at its session on July 2 1938 and

WHEREAS The American Red Cross is proposing the following changes in its handbook setting forth its policies in regard to medical services in disaster now therefore be it

Resolved By the House of Delegates of the American Medical Association that the proposed changes in regard to medical services of the American Red Cross in disaster relief be approved as follows

RELATIONSHIP WITH PHYSICIANS DENTISTS AND HOSPITALS

III 3 The primary responsibility for the care of the sick and injured in disasters rests with the local physicians Red Cross medical service does not substitute for the services of local physician and dentists but operates with them and assists by organizing and directing the medical relief work and by providing the facilities which they lack and need for the emergency Every effort is made to maintain and reestablish as

quickly as possible the predisaster relationship between physicians and dentists and their patients In the first few days it is often necessary to apply aid on a mass basis in emergency medical stations This practice is discontinued as soon as possible and patients are referred to their own physicians and dentists

Red Cross medical and dental assistance is intended only for those who are ill or injured because of the disaster or whose condition is aggravated by the disaster and who are unable to obtain care because of lack of resources Exceptions may be made in certain emergencies obstetrics for example when medical service is not otherwise available

III 4 It is hoped that physicians and dentists like other community leaders engaged in various phases of disaster relief work will give their services on a volunteer basis for patients unable to pay during the emergency period On approval of the director actual expenses incurred and cost of the supplies used by physicians and dentists may be paid those volunteering their services in the emergency period Unless they have been previously employed for that purpose physicians should not be paid for work during this emergency period

After an emergency period the duration of which is to be determined by the disaster director advised by his medical director after conference with representatives of the county medical society the Red Cross recognizes its responsibility to the medical profession for paying reasonable fees to physicians who treat disaster victims Reasonable fees shall be interpreted as ward clinic or county rates and shall be worked out by mutual understandings between medical directors and state and local medical societies prior to or during a disaster operation

III 5 Reasonable hospital rates including ordinary service medicine dressings operating room x rays serums antitoxin and other biologics may be paid on a case work basis for the care of patients with disaster caused illness or injuries or those whose condition is aggravated by the disaster Blood plasma which cannot be replaced from stocks accumulated for that purpose or from volunteers who are willing to replace that used from local blood banks may be paid for at cost Ward rates are generally considered reasonable Commitments shall not be made until agreements have been approved by the disaster director Verbal agreements between hospitals and the Red Cross shall be given written confirmation by the medical director

Resolution Requesting Study of Nursing Licensure Requirements

Dr Stephen E Gavin Wisconsin presented the following resolution which was referred to the Reference Committee on Medical Education

WHEREAS For many years there has been a continuous and meritorious effort to elevate the requirements for nursing licensure in the several states and

WHEREAS These efforts directed toward the establishment of a unified and recognized field of nursing provided with such safeguards as to assure the maximum protection to the public health have resulted in increasing difficulties in securing an adequate number of enrollees in the various nursing schools and

WHEREAS There is a current shortage of nurses and because of the reciprocal arrangements between states an inability exists on the part of the individual states as such to make such changes in their laws as would facilitate the enrolment and graduation of trained nurses now therefore be it

Resolved That the House of Delegates of the American Medical Association request the Council on Medical Education and Hospitals to study the nursing licensure requirements of the several states and the problem created by the war emergency and in cooperation with the several state medical associations to suggest such changes as may be indicated on the national level consistent with good public health protection and so designed as to increase the availability of nurses within the country

Resolution Requesting Constituent Associations and Component Societies to Consider the Establishment of Some Form of Dues for Their Members in Service

Dr James C Sargent Wisconsin presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business

WHEREAS Motivated by the finest sort of patriotic interest our component county medical societies and constituent state medical associations everywhere throughout the land have acted to remit for the duration the dues of those of us who have been called to the colors and

WHEREAS A realistic view of the enormous military program to which our country is committed surely suggests that this action may over some protracted years undermine the financial structure of many of these local organizations and

WHEREAS It is most important to the future of American medicine that the already large and ever growing block of physicians temporarily dislocated from home and practice be kept intimately connected with and an active part of their local professional organizations be it hereby

Resolved That this House of Delegates urge on each of its constituent state associations and through them each of the component county medical societies of which they in turn are composed to give consideration to the establishment of some form of dues for their members in service which will not be great enough to blight in the least the financial condition of their organization but which will be adequate to insure the long term financial position of their organization as well as the active interest and participation of their absent members.

Resolution Authorizing Establishment of an Executive Office of American Medical Association in Washington, D C

Dr. Binner J. Ham, in behalf of the Ohio State Medical Association, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations

WHEREAS The medical profession is conscious of its responsibilities in providing medical services to all of the American people, and

WHEREAS The medical profession believes that it is its duty to make available accurate facts, data and medical opinion with respect to existing and proposed medical and health programs and is ready to offer constructive leadership on such matters, and

WHEREAS Many proposed reforms to medical and health services during the postwar era are under consideration at Washington involving legislation and regulatory procedures, and

WHEREAS It has become increasingly important that first hand information on such matters should be made available to the medical profession generally and vital relationships established between the medical profession and members of the legislative and executive branches of the federal government so that the views of the medical profession can be transmitted promptly to proper officials of such branches therefore be it

Resolved That the House of Delegates of the American Medical Association authorize the establishment of an executive office of the American Medical Association at Washington D C in charge of a full time director who shall be directly responsible to the Board of Trustees of the American Medical Association in serving as a liaison on legislative and governmental activities pertaining to medical and health matters

Resolution on Technical X-Ray Training Courses

Dr. E. H. Skinner, Section on Radiology, presented the following resolution, which was referred to the Reference Committee on Medical Education

WHEREAS It is the function of the American Registry of X-Ray Technicians to elevate the standards and improve the training of x-ray technicians, and

WHEREAS The American Registry of X-Ray Technicians has established a list of approved training courses for x-ray technicians which have been investigated and deemed adequate for their purpose, and

WHEREAS The recognition of such training courses by the Council on Medical Education and Hospitals of the American Medical Association

is desirable for the proper inspection and maintenance of these courses, therefore, be it

Resolved That the House of Delegates of the American Medical Association recommend this to the Council on Medical Education and Hospitals for proper action

It was moved by Dr. Francis F. Borzell, Pennsylvania, that action on all resolutions referring to the establishment of a bureau or service in Washington be reported in Executive Session. The motion was seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried.

Report of Reference Committee on Rules and Order of Business

Dr. R. L. Zech presented the following report, which on motions of Dr. Zech, duly seconded and carried, was adopted section by section, the second section of the report by more than a two-thirds vote of the members registered

1 Your Reference Committee on Rules and Order of Business recommends that on Tuesday, June 8, after completion of routine business, the House shall enter into Executive Session

2 WHEREAS Section 4, chapter 4 of the Constitution and By Laws provides for the election of officers on Thursday, the fourth day of the meeting of the House of Delegates, and

WHEREAS The same section 4, chapter 4, provides that the election of officers may be held at another time provided for in the same section, and

WHEREAS It is important that the physicians attending this session of the House of Delegates be able to return to their practices at an early date, therefore be it

Resolved That the House of Delegates hold the election of officers on Wednesday, June 9, 1943, immediately following the completion of routine business

Respectfully submitted,

R. L. ZECH, Chairman
E. N. ROBERTS
GEORGE P. JOHNSON
EDWARD N. EWER
A. A. WALKER

The House recessed at 2:05 p. m., to meet at 9:30 a. m.
Tuesday, June 8 (To be continued)

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status—H. R. 2536 has passed the House, a bill to provide for the promotion of vocational rehabilitation of persons disabled in industry or otherwise. H. R. 2713 has passed the Senate, making appropriations for the Navy Department and the naval service for the fiscal year ending June 30, 1944. This bill as passed by the Senate retains the language under which appropriations made available for the Navy Department may be utilized to pay commissioned medical officers who are graduates of reputable schools of osteopathy.

Bills Introduced—S. 1130, introduced by Senator Thomas, Utah, proposes to enact the "War-Area Child-Care Act of 1943." A federal appropriation of \$1,500,000 will be authorized for the fiscal year ending June 30, 1943 and an appropriation for each fiscal year thereafter of \$20,000,000 for allotments to the states, with the proviso that the program will expire six months after the end of the war. State plans for day care services must be submitted by the state public welfare agency and approved by the chief of the Children's Bureau, and state plans for extended school services must be submitted by the state educational agency and approved by the United States Commissioner of Education. A state plan for day care services, among other things, may provide for care through foster family services or in day care centers, community-wide information and advisory services for mothers, health services for children, and other auxiliary services necessary to assure proper use of day care facilities and to safeguard children receiving care under the plan. H. R. 2832, introduced by Representative

Gearhart, California, proposes to amend the Nationality Act of 1940 so as to permit naturalization proceedings to be had at places other than in the office of the clerk or in open court in the case of sick or physically disabled individuals. H. R. 2892, introduced by Representative Sparkman, Alabama, provides that during the present war and for six months thereafter there shall be included in the Medical Departments of the Army and Navy such licensed female dentists as the Secretary of War and the Secretary of the Navy may consider necessary. Those appointed will be commissioned in the Army of the United States or in the Naval Reserve and will receive the same pay and allowances and be entitled to the same rights, privileges and benefits as members of the Officers' Reserve Corps of the Army and the Naval Reserve of the Navy with the same grade and length of service.

STATE MEDICAL LEGISLATION

Alabama

Bill Passed—Substitute for S. 22 passed the Senate, June 1. It would require the state board of health, with the assistance of the committee on cancer control of the Medical Association of the State of Alabama, to formulate a plan for the care and treatment of indigent persons suffering from cancer and to establish and designate standard requirements for the organization, equipment and conduct of cancer units or departments in general or private hospitals or private clinics of the state. The board would also be required to formulate and put into effect an educational plan for the purpose of preventing cancer.

throughout the state, aiding in the early diagnosis of cancer and informing hospitals and cancer patients of the proper treatment

Bill Enacted—S 35 has become Governor's Act No 89 of the Laws of 1943. It provides for the creation and establishment of a four year school of medicine in the state to be under the sole management, ownership and control of the Board of Trustees of the University of Alabama and to be known as "The Medical College of Alabama"

California

Bills Enacted—S 1023 has become chapter 1001 of the Laws of 1943. It prohibits the possession, transportation or use of any local anesthetic of the cocaine group, including but not limited to natural or synthetic drugs of this group, such as allocaine, apothesine, alpine, benzyl carbinol, butyn, procaine, nupercaine, beta-eucaine, novol or anestubes, within a horse racing inclosure except on a bona fide veterinarian's prescription with complete statement of uses and purposes of the same on the container. A 573 has become chapter 1047 of the Laws of 1943. It prohibits the board of osteopathic examiners from issuing any drugless practitioner's certificates and provides that all persons holding such certificates may continue to practice thereunder and may renew them, subject to the provisions of the law. A 829 has become chapter 871 of the Laws of 1943. It amends the law relating to premarital examinations by providing that certificate forms furnished by other states having comparable laws will be accepted for persons who have been examined and who have received serologic tests for syphilis outside of California provided such examinations and tests are performed not more than thirty days prior to the issuance of a marriage license. The amendment further provides that certificates furnished by the United States Army or Navy will be accepted for military personnel provided such certificates are signed by a medical officer commissioned in the United States Army or Navy and provided the certificates state the examinations and serologic tests for syphilis were performed not more than thirty days prior to the issuance of the marriage license. A 1191 has become chapter 914 of the Laws of 1943. It amends the welfare and institutions code by providing that no person shall maintain an establishment for the mentally ill without having obtained a license from the state department of institutions. A 1335 has become chapter 977 of the Laws of 1943. It amends the law relating to the use and sale of poisons by, among other things adding the following poisons to schedule C 1: acetylurea, sulfonated methanes, paraldehyde, sulfanilamide except in tablets of 30 grains or more designed for stock purposes only and so labeled, sobismmol, amidopyrine, cinchophen, ergot, diethylstilbestrol, provided that they may be sold only at retail on order or prescription of a physician, dentist, chiropractor or veterinary surgeon duly licensed to practice in California and shall not be refilled without order of the prescriber, to schedule C 2: amphetamine, thyroid, phenylhydantoin or their compounds provided they are sold only at retail on the written order or prescription of a physician and surgeon, dentist, chiropractor or veterinary surgeon licensed to practice in the state but such prescription may be refilled for the person for whom originally written.

Connecticut

Bill Passed—Substitute for S 484 passed the senate and the house on May 19. To amend the law relating to the labeling and sale of drugs it proposes to add narcotic drugs to the list of drugs which a physician, veterinarian or dentist is prohibited from prescribing except for emergency use.

Bills Enacted—S 257 has become chapter 291 of the Laws of 1943. It amends the medical practice act by requiring applicants for license to show that they have received the degree of doctor of medicine rather than merely a diploma of graduation from an approved school. S 804 has become chapter 280 of the Laws of 1943. It amends the chiropractic law by eliminating the requirement of professional study for a period of four years or thirty six weeks each and substituting therefor the requirement that such course consist of four years or eight months each totaling not less than three thousand six hundred hours. H 1198 has become chapter 301 of the Laws of 1943. It requires each physician to report in writing to the health

officer of the town, city or borough in which such case shall occur, within twelve hours after his recognition thereof, each case of cholera, yellow fever, typhus fever, leprosy, smallpox, diphtheria, typhoid fever, scarlet fever, all forms and stages of syphilis, all forms and stages of gonorrhea, chancroid or other contagious or infectious diseases occurring in his practice.

Florida

Bill Enacted—S 580 was approved, June 1, 1943. It provides that the several colleges and universities located and operating in the state of Florida shall be authorized, directed and required to waive the last two semesters of preparatory college work required for entrance to the various professional schools operated by them in all instances where the applicant for admission and study in such professional schools has completed all preparatory college work required for such admission except two semesters or less of study in the preparatory subjects and where such applicant has failed to complete his or her last two semesters or less of preparatory study by reason of his or her having been inducted into any branch of the armed forces of the United States during or after the month of January 1940.

Illinois

Bill Introduced—H 802, to amend the medical practice act, proposes that the entry of a decree by any court or competent jurisdiction establishing the insanity of any person holding a license to practice medicine would operate as a suspension of such license until such time as a committee of physicians should find that the licensee has been restored to sanity.

Massachusetts

Bill Passed—H 1820 passed the house, June 2. To amend the premarital examination law, it proposes to authorize the execution of the required certificate by a physician registered or licensed to practice in any other state of the United States, territory or District of Columbia, in addition to Massachusetts licensees.

Bills Enacted—S 470 has become chapter 421 of the Laws of 1943. It amends the existing law authorizing any license permit or certificate of registration issued by any department, division, board, commission or officer that expires while the holder thereof is serving in the military or naval service of the United States to be renewed within six months after the termination of such service and by providing further that no fee shall be charged or collected for the period between the expiration of the certificate and the renewal thereof. H 1754 has become chapter 375 of the Laws of 1943. To amend the law relating to policies of insurance against legal liability for loss or damage on account of bodily injury or death it permits such policies to be amended so as to insure any person in respect to medical, surgical, ambulance, hospital, professional, nursing and funeral expenses. H 1755 has become chapter 384 of the Laws of 1943. It amends the law relating to physical examinations of school children by requiring examinations of the feet of such children to be made by the school physician to ascertain any defects which might unfavorably influence the child's health or physical efficiency during childhood, adolescence and adult years. H 1791 has become chapter 387 of the Laws of 1943. It amends the law relating to the registration of nurses by providing that during the existing war applicants for registration need only be 20 rather than 21 years of age.

Missouri

Bill Introduced—H 590 to amend the law relating to the practice of osteopathy was amended in the house so as to define the practice of osteopathy as the system, method, art or science of treating diseases, injuries or defects of the human body as taught and practiced by the American School of Osteopathy of Kirksville, Mo. The amendment would further provide that any person now licensed or who may hereafter be licensed to practice osteopathy in Missouri and who is a graduate of a reputable school of osteopathy which at the time of graduation offered a full course in medicine and surgery in addition to the regular course of osteopathy and which school had entrance requirements, facilities in instruction and training, or a standard equivalent to the recognized medical colleges of the state, may

on a finding by the state board of health that such person had met the basic requirements, be permitted to take the examination, and, on successfully passing same, to practice medicine and surgery as osteopathic physicians and surgeons.

Nebraska

Bill Enacted—Bill No. 295 was approved, May 29. It provides that any county or group of counties may establish a county or district health department with a medical director at its head, who shall be required to give his entire time to the duties of his office, and such other necessary qualified full time medical health officers and such sanitary inspectors, public health nurses and clerical assistants as may be necessary to carry on the activities pertinent to a county or district health department.

Pennsylvania

Bills Enacted—S. 209 has become act 212 of the Acts of 1943. It amends the osteopathic law by providing, among other things, that the board of examiners, by inspection or otherwise, shall examine and fix the rating of all colleges and hospitals outside the state whose graduates or interns desire to obtain osteopathic licensure in Pennsylvania. The standards for approval of osteopathic hospitals in Pennsylvania, however, shall be required in fixing the rating of out of state institutions.

214 has become act 217 of the Acts of 1943. It provides that for the duration of the war a minimum of nine months shall constitute the necessary training for an intern in a hospital approved for intern training to qualify for admission to an examination for licensure by the osteopathic surgeons' examining board to practice major surgery in Pennsylvania. S. 371 has become act 230 of the Acts of 1943. It provides that for the duration of the present war and one year thereafter certain persons eligible to registration as nurses prior to 1938 may be registered by waiver or examination on proof that she meets the Pennsylvania requirement as of the time of her graduation, and without examination if, prior to 1942, she graduated from a reputable hospital, sanatorium or training school in which a systematic course of practical instruction in nursing was given. S. 531 has become act 219 of the Acts of 1943. It authorizes county commissioners of second class counties to enter into contracts with the proper authorities of any city within the county for the hospitalization of persons suffering from any infectious disease and makes appropriations for such purposes. H. 668 and H. 669 have become act 167 and act 168 respectively, of the Acts of 1943. They amend the law regulating and supervising nonprofit medical service corporations by providing, among other things, that subscribers earning more than a certain specified sum shall be liable to doctors of medicine registered with the corporation and rendering services to such persons for the full amount of the usual fees and charges for such services made by doctors of medicine and any payment made by the corporation to doctors for rendering such services shall be a payment on account only and not necessarily

in full. H. 823 has become act 182 of the Acts of 1943. It amends the law relating to the physical examination of school children by providing that for the duration of the present hostilities and for six months thereafter the examination may be made by any physician licensed to practice medicine in Pennsylvania if the parent or guardian or employer is willing to pay for the same. Previously the examination had to be made by a physician employed by the board of school directors of the school district in which the minor resided or by a physician employed by the state department of health.

South Carolina

Bill Enacted—H. 518 was adopted, April 1. It is a resolution providing for the appointment of a committee to examine into the advisability of establishing a cancer clinic and hospital in the state.

Texas

Bill Enacted—H. 20 became a law without approval, June 1. It provides for the creation of a separate state board of examiners for chiropractors and defines chiropractic to be the science of analyzing and adjusting the articulations of the human spinal column and its connecting tissues without the use of drugs or surgery. Under this law chiropractors will not be allowed to treat any person for infectious or contagious diseases or engage in the practice of medicine. S. 230 was approved, May 22. It provides that no person shall operate or cause to be operated any emergency ambulance, public or private, or any other vehicle commonly used for the transportation or conveyance of the sick or injured, without first securing a permit therefor from the state board of health. Every such ambulance shall be equipped with a first aid kit and traction splints for the proper transportation of fractures of the extremities and shall be accompanied by at least one person who has acquired theoretical or practical knowledge in first aid as prescribed and certified by the American Red Cross and evidenced by a certificate issued to such person by the state board of health.

Wisconsin

Bills Enacted—S. 36 has become chapter 247 of the Laws of 1943. It amends the law relating to coroners so as to provide for the appointment of medical examiners. S. 195 has become chapter 172 of the Laws of 1943. It amends the law relating to deputy state health officers by increasing the annual salary thereof from 3 to 4 thousand dollars. A. 433 has become chapter 195 Laws of 1943. It provides for an appropriation by county boards toward the maintenance and support of duly organized and bona fide nursing associations in the county, such associations to have at least one qualified nurse. A. 486 has become chapter 125 of the Laws of 1943. To amend the law relating to positions in the unclassified civil service in certain counties in the state, it provides that students and interns in medical or professional specialties shall be included within the list of unclassified civil service positions.

MEDICAL ECONOMIC ABSTRACTS

PRESCHOOL CHILD MORTALITY

One of the best tests of success in maintaining the health of the public is child mortality. During the greater part of the nineteenth century it was frequently stated that more than half the deaths in any community were those of children under 5 years of age. Even at the beginning of the present century "the death rate for the 1 to 4 year age group was 198 per thousand children,"¹ but by 1940 this rate had fallen to 29, or one ninth of the rate forty years previously. Not only do a much larger percentage of the children born reach the age of 4, but the increase in life expectancy indicates that "the preschool child of today will probably live, on the average, about six or seven years longer than the preschool child of forty years ago."

There are still sharp racial differences in child mortality so that "in general the life expectancy of the nonwhite child is

about ten years less than for white children of the same sex." There are also significant sectional differences, varying from a rate of 49 per thousand in the West South Central states to 19 in Minnesota, Iowa and Wisconsin. Cities of over 100,000 show a uniformly lower death rate than the smaller cities and rural districts, a condition which is accredited to "the opportunities of generally better and more nearly adequate facilities for medical care in the cities. The specific immunization to some of the more important childhood diseases is of particular importance in this connection."

Certain of the diseases most deadly to children in 1900 have shown significant declines in importance. While influenza and pneumonia, diarrhea, enteritis and tuberculosis are still important as causes of death among children, the toll of these diseases has been decreased to a fraction of what it was forty years ago, while accidents now rank second as the cause of fatalities.

¹ The Preschool Child, Bureau of Census, Vital Statistics, Special Reports, Mortality Summary, Feb. 19, 1943.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

ARKANSAS

District Meetings—The eighty-first semiannual meeting of the First Councilor District Medical Society of Northeast Arkansas was addressed, May 27, in Jonesboro by Drs Herbert H McAdams, Jonesboro on 'Appendicitis' and Neuton S Stern, Memphis Tenn, 'Heart Neurosis' The district society is composed of Clay Craighead, Crittenden, Greene, Lawrence, Mississippi Poinsett and Randolph counties—The Fifth Councilor District Medical Society was addressed at Magnolia, May 20 by Drs Charles Robert Watson and George V Lewis, Little Rock on 'Neurosurgical Conditions in General Practice' and 'Treatment of Burns,' respectively The fifth district includes Calhoun Columbia, Dallas Lafayette, Ouachita and Union counties

CALIFORNIA

Changes in Health Officers—Dr Concessa L Cravotto has been appointed health officer of Oroville succeeding Dr Charles Benninger Jr—Dr Dean Eldon Hart Oakland was appointed health officer of Emeryville succeeding Dr Charles Newell Mell Oakland—Dr James L Faulkner has replaced Dr Russell G Frey as health officer of Red Bluff

New Dean of College of Medical Evangelists—Dr Newton G Evans professor and head of the department of pathology and a member of the board of trustees of the College of Medical Evangelists Loma Linda-Los Angeles, on May 5 was unanimously elected dean to succeed the late Dr Edward H Risley Loma Linda Dr Evans who graduated at Cornell University Medical College New York in 1900 has been head of the department of pathology for thirteen years He is also chief pathologist of the Los Angeles County Hospital

Quarantine on Mussels—The state department of public health on May 1 placed a quarantine on all mussels along the ocean shores of California including the bay of San Francisco from the Oregon-California boundary line on the north to the California-Mexico boundary on the south The taking sale or offering for sale of mussels in or from the area specified is prohibited with the exception that permission may be given to take mussels to be used for fish bait if such mussels are rendered unfit for food purposes by processing with salt These processed mussels must be placed in containers labeled 'For Fish Bait Only—Unfit for Human Consumption' The quarantine will be in effect until October 31

DISTRICT OF COLUMBIA

Physician Indicted on Narcotic Charge—Dr Homer K Butler Washington was indicted May 24 on charges of violation of the Harrison Narcotic Act According to the Washington Post Dr Butler was charged with writing prescriptions for about 60 grains of morphine between July 1942 and January 1943 The prescriptions are alleged to have been written for the same person but under different names

Pathologist Dies—Gilbert T Creech DVM since 1912 veterinary pathologist in the division of pathology of the U S Department of Agriculture died on June 2 in Garfield Memorial Hospital aged 63 Dr Creech received his DVM at the Kansas City Veterinary College in 1910 and joined the department of agriculture the same year first serving as veterinary inspector in the field and meat inspection division of the bureau of animal industry

ILLINOIS

Personal—Effective July 5 Reuben F Reider passed assistant surgeon reserve serving in Illinois on loan from the U S Public Health Service is the state's district health superintendent for the counties of Coles DeWitt Douglas Edgar Macon McLean Moultrie and Piatt, with headquarters in Decatur Dr Reider replaces Dr Wilmer M Talbert Decatur who has been granted a military leave from state service to enter the U S Navy

Chicago

League for Planned Parenthood—Dr Eugene A Edwards was chosen president of the Illinois League for Planned Parenthood at the recent annual meeting and Mrs William B

Goltra as secretary Mrs Ben Humphries Gray is the executive secretary Among the topics discussed at the meeting were 'Nation, State and Local Planned Parenthood Trends,' 'Planning for Democracy' 'Importance of Planned Parenthood in Peace and War' and 'Understanding the Emotional Responses to Planned Parenthood.'

Meeting of Pathologists—The Illinois Society of Pathologists presented the following program at its meeting in the Palmer House May 18

Lieut Comdr Jerry J Kearns (MC) U S N R Duties of a Pathologist in a Naval Hospital
Joseph M Lubitz assistant surgeon U S Public Health Service Reserve Duties of a Pathologist in the Public Health Service
Dr Gail M Dack Food Poisoning
Dr Heinrich Necheles and William H Olson Studies on Pathologic Physiology of Burns
Dr Howard C Hoppes The Use of Gelatin as a Blood Substitute

The afternoon was devoted to a seminar with cases and microscopic slides being presented by the members The next meeting will be in November

IOWA

Special Society Election—Dr Helen Johnston Des Moines was chosen president-elect of the State Society of Iowa Medical Women at its annual meeting in Des Moines, April 28 and Dr Christine S Erickson-Hill, Council Bluffs, was installed as president Other officers are Drs Gladys A Cooper Red Oak vice president Erma A Smith Ames secretary, and Edna K Sexsmith Harper Greenfield treasurer

Diets and Food Rationing—The Polk County Medical Society Des Moines recently issued a special message to the public listing eight points by which the public could cooperate with the medical profession in providing essential medical care In addition the society has cooperated with the local ration boards by drawing up special diets to be available during the rationing program These diet lists and instructions of the procedure to be followed by physicians and their patients have been printed in the state medical journal and issued in special bulletins

Sight Saving Program—The general assembly has granted an appropriation to the state board of education to establish a sight saving class at the Iowa School for the Blind when school opens September 7 A classroom will be equipped to meet the sight saving standards set forth by the National Society for the Prevention of Blindness including special artificial lighting window shades, blackboards large type books sight saving desks and bulletin type typewriters A teacher with special training in sight saving will be employed to handle the schoolroom work Children may be considered eligible for sight saving classes if they are in any of the following groups: children having a visual acuity between 20/70 and 20/200 in the better eye after refraction children with progressive eye difficulties, and children suffering from noncommunicable diseases of the eye or diseases of the body that seriously affect vision

KANSAS

Course in Tropical Medicine—The Kansas Medical Society and the University of Kansas School of Medicine opened a postgraduate course in tropical medicine in Emporia May 22-23 the first in a series to be given in cities throughout the state The second was held in Wichita May 29-30 and the third in Salina June 12-13, courses are planned for Parsons, Kansas City and Topeka The instructors include Dr Harry L Douglas assistant professor of medicine University of Kansas School of Medicine Kansas City Herbert B Hungerford Ph D professor of entomology of the University of Kansas Lawrence and Mary E Larson AM assistant professor of zoology of the University of Kansas

MICHIGAN

Personal—Dr Donald M Morrill formerly medical superintendent of the City of Detroit Receiving Hospital has been appointed director of the Malden Hospital Malden Mass Dr Ralph R Piper Detroit has been named acting superintendent for the duration—Dr George H Cook Caro has been appointed medical superintendent at the Ionia State Hospital, Ionia

Proposed Wayne County Hospital Approved—The Ways and Means Committee of the Wayne County Board of Supervisors recently approved the proposed new Wayne University County Hospital and appointed a special subcommittee to make a more careful study of the project The hospital to be operated by the Wayne University College of Medicine Detroit was recently approved by the board of education and

it sanctioned the general plan for the proposed Detroit Medical Center to be constructed on a 50 acre site on Jefferson Avenue near Burns.

Lieutenant Boelkins Wins Fellowship—Dr. Richard C. Boelkins, first lieutenant in the medical corps of the A. U. S. Army Corps, has been awarded the 1943 Edward and Susan Lowe Fellowship at Butterworth Hospital, Grand Rapids. The fellowship is awarded annually to one of the hospital's younger staff members on the basis of increased ability in diagnosis and treatment, cooperative spirit and willingness to teach others, including the interns. Lieutenant Boelkins graduated at the University of Michigan Medical School, Ann Arbor, in 1937 and interned at Butterworth Hospital.

Malaria Control—Dr. H. Allen Moyer, Lansing, state health commissioner, has invited Charles I. Williams, medical director and chief of malaria control, U. S. Public Health Service, to discuss possible control measures in the Calhoun County area with army, state and county health authorities, it was announced on May 27. Plans are under consideration for the establishment of a mosquito control area in western Calhoun County to lessen the hazard of spread of the disease from soldiers returned to the Percy Jones Hospital, Battle Creek, from the southwest Pacific but elsewhere citizens may have to institute their own control measures, it was stated.

"Proof of Disability" Blank—The Ingham County Medical Society has adopted a "proof of disability" blank which is designed as a time saver for physicians and which specifies that any further information may be obtained by the insurance company for a fee of \$2. At the convention of the state medical society in 1927 the fee was set as a surcharge for the search of records and the compiling of information for a medical insurance proof of disability. The blank may be procured from the state medical society at 2020 Olds Tower, Lansing. Under the stress of war conditions in the practice of medicine, the burden of giving adjustment and investigational information to health insurance companies has become more time consuming than appears to be necessary to furnish adequate proof of disability, an announcement stated.

NEW JERSEY

Princeton Buys Physician's Home—Princeton University, Princeton, has bought the home of its oldest living alumnus, Dr. William H. Vail, 97 years old of Newark. According to the *New York Times*, Princeton has taken title to the house at 141 Second Avenue so the retired physician, last surviving member of the class of 1865, might continue to occupy it "as long as he may desire." The action which was approved by the university's board of trustees, was made possible by gifts from alumni and friends, specifically earmarked for the purpose. Dr. Vail graduated at Princeton at the close of the Civil War after playing on the university's first baseball team. He graduated at the College of Physicians and Surgeons of Columbia College, New York, in 1869, of which he is also said to be the oldest living alumnus. Dr. Vail retired from active practice about thirty years ago. During the past few months he has been ill at home suffering from the effects of a fall.

NEW YORK

Personal—Alfred Einar Sherndal, Ph.D., New York, plant superintendent of Winthrop Chemical Company since 1934, recently received the honorary degree of doctor of science from St. Lawrence University, Canton, for his research work in making possible the synthesis and manufacture of atabrine.

Diabetic Camp Opens July 1—Camp Nyda at Wallkill will open on July 1 to receive about one hundred underprivileged diabetic children of New York, where they will spend a two week vacation under the auspices of the New York Diabetes Association. This year will mark the seventh for the operation of the camp. The medical department of the camp is under the supervision of Dr. Herman O. Mosenthal, clinical professor of medicine at the New York Post-Graduate Medical School and Hospital, Columbia University.

Dr. MacCurdy Appointed Commissioner of Mental Hygiene—Dr. Frederick MacCurdy, superintendent of the Vanderbilt Clinic of the Columbia University Presbyterian Medical Center and professor of hospital administration of Columbia University, on June 3 was appointed by Governor Dewey as state commissioner of mental hygiene. The *New York Times* reported that Dr. MacCurdy's appointment was made possible by the recent enactment of a law repealing the requirement that the commissioner of mental hygiene must have at least ten years of psychiatric experience in a mental hospital. While Dr. MacCurdy once specialized in neurology and psychiatry, he would not have qualified for the commissionership under

the old law. Dr. MacCurdy graduated at Columbia University College of Physicians and Surgeons in 1912. He was formerly president of the state hospital association and is said to be one of the original members of the board which planned and constructed the Columbia Presbyterian Medical Center, serving there since 1928 as superintendent of the Vanderbilt Clinic.

New York City

Crime in Wartime—A symposium on crime in wartime constituted a recent meeting of the International Spanish Speaking Association of Physicians. Among the speakers discussing the various aspects of the crime dilemma in wartime were Drs. George W. Henry, psychiatrist, R. S. Banay, criminologist, and J. Wilder, neurologist. Dr. Ricardo Adolfo de la Guardia, president of Panama, was present at the meeting and accepted the honorary presidency of the association.

Memorial Trees Planted—A tree planting ceremony was held at the Richmond Memorial Hospital, Dreyfus Foundation, Staten Island. Services memorialized with one tree each were the army, navy, merchant marine, marine corps and coast guard. One was named for Dr. Herbert Lynn Halbert, former president of the Richmond County Medical Society, who died April 7, and one for Dr. Harry Eckstein, member of the staff, who died March 21. Other trees honored the memories of a member of the Ladies Auxiliary, a nurses aide on the staff and a maritime nurse man at the hospital.

Gifts to New York University—More than \$201,000 has been given to New York University during the past three months, according to *Science*, March 26, including \$100,000 from the George F. Baker Charity Trust, half of which will be used to increase the endowment of the Samuel A. Brown professorship of therapeutics. The remainder will be used for the college of medicine at the discretion of Dr. Currier McEwen, dean of the medical school. The Commonwealth Fund gave \$9,784 to the college of medicine for the study of hypertensive and renal diseases, research in obstetrics and gynecology and other uses.

Gynecologist Honored—On June 8 Dr. Hiram N. Vmeberg, consulting gynecologist at the Mount Sinai Hospital, was presented with a special volume of scientific writings to mark his completion of sixty-five years in the practice of medicine. The volume is the gift of Dr. Vmeberg's colleagues and consists of a three hundred and sixty page issue of the *Journal of the Mount Sinai Hospital*. In 1878 Dr. Vmeberg graduated at McGill University Faculty of Medicine, Montreal. In 1894 he was appointed chief of staff in the outpatient department in Mount Sinai Hospital, where he has been ever since, having been appointed consulting gynecologist on his retirement from active service in 1921. In 1918 he was president of the New York Obstetrical Society and in 1926 a vice president of the American Gynecological Society.

Personal—Dr. John B. Lauricella has resigned as medical director of the State Insurance Fund, the *New York Times* reported recently. Dr. David D. Rutstein, Albany, has been appointed deputy commissioner in the New York City Health Department. The Medical Society of the County of Kings and the Academy of Medicine of Brooklyn recently presented Mr. Charles Frankenberger, Brooklyn, with a watch in recognition of his completion of twenty-five years' service as librarian. Dr. Henry Roth, a charter member of the Bronx County Medical Society, was given a dinner on April 7 to observe his completion of fifty years in the practice of medicine. Lorenz J. Brosman, counsel for the Medical Society of the State of New York for about twenty years, died on April 13, aged 49. Vincent du Vigneaud, Ph.D., head of the department of biochemistry at Cornell University Medical College, is the new chairman of the New York Section of the American Chemical Society.

NORTH CAROLINA

State Health Officer Re-elected—Dr. Carl V. Reynolds, Raleigh, was re-elected secretary and state health officer at a recent meeting of the state board of health, and Dr. George M. Cooper, Raleigh, was re-elected assistant state health officer, both are for terms of four years.

State Medical Election—Dr. Paul F. Whitaker, Winston, was chosen president-elect of the Medical Society of the State of North Carolina at its annual meeting in Raleigh May 12, and Dr. James W. Vernon, Morganton, was installed as president. Other officers include Drs. Frederic C. Hubbard, North Wilkesboro, and George L. Carrington, Burlington, vice presidents, and Roscoe D. McMillan, Red Springs, secretary, treasurer and delegate to the American Medical Association. The society voted to hold its 1944 session at Pinchburg.

OHIO

Survey on Availability in Industrial Work—The committee on industrial medicine and health of the Academy of Medicine of Cincinnati is making a survey of its members to learn what physicians are willing to accept a full or part time assignment as physicians in industrial plants. About a year ago the academy assembled similar information, but since then a number of physicians who indicated their willingness to cooperate in industrial activities have gone into military service. The new survey aims to bring up to date the number of physicians that would be willing to assist in this type of service.

Conference on Conservation, Nutrition and Human Health—The second annual conference on conservation, nutrition and human health will be held at Tar Hollow, June 26-27. Among the speakers will be

Dr. William F. Petersen, Chicago. Weather and Man.
Dr. Norman C. Wetzel, Cleveland. The Biology of Growth.
Dr. George M. Curtis, Columbus. The Role of Iodine in the Nutrition of Soil Bacteria Plants and Animals.
William A. Albrecht, Ph.D., Columbia, Mo., Calcium in the Soil for the Nutrition of Microbes Plants and Animals.
Dr. Zoltan T. Wirtschatter, Cleveland. The Importance of Minerals in Human Nutrition.
John D. Detwiler, Ph.D., London, Ont. Conservation—The Basis of Human Progress.
Dr. Jonathan Forman, Columbus. Conservation Nutrition and Human Health.

Gov. John W. Bricker will speak Sunday afternoon on "Ohio's Conservation Program."

Physicians Refused Parking Privileges—The city manager of Cincinnati at a conference with Mr. Elmer E. Hunsicker, clerk of courts, and the city safety director, was so definite in his opposition to a proposal that special permits be given to physicians while on emergency calls to park their cars without being cited for violating parking regulations that the plan was abandoned. Mr. Hunsicker believed that some relief should be given to physicians who, especially during wartime, are pressed for time. He took the initiative on behalf of the medical profession and expressed his willingness to speak before the city council. At his request a member of the Academy of Medicine of Cincinnati was assigned to go with him for a preliminary conference with the city manager and the city safety director before taking it to the city council. The manager's opposition was so definite that it was decided to pursue the matter no further.

OREGON

Student Externships Resumed—The University of Oregon Medical School, Portland, has reinstituted student externships in the curriculum of fourth year students. Hospitals where the training is being given include St. Vincent's Good Samaritan, Emanuel, Providence, Coffey Memorial and Halme-nann, all of Portland.

Honorary Degree to Dr. Fenton—The University of Oregon, Eugene, conferred the honorary degree of doctor of science on Dr. Ralph A. Fenton, Portland, for his work on otology, rhinology and laryngology. Dr. Fenton has been for many years a member of the Board of Trustees of the American Medical Association.

TENNESSEE

Personal—Dr. John S. Freeman, Springfield, is now president of the Tennessee Tuberculosis Association, advancing to this position from the vice presidency succeeding the late Dr. Horton R. Casparis, Nashville.—Dr. Asher R. McMahan, Memphis has been appointed medical director of the Columbian Mutual Life Insurance Company to succeed Dr. James L. Andrews, Memphis, who was vice president and medical director at the time of his death on January 10.—Dr. Joseph E. Wheeler, formerly chief medical officer of the Veterans Administration Facility, Togus, Maine, has been named clinical director at the Veterans Administration Facility, Memphis, succeeding Dr. Lewis A. Walker, Memphis.—Dr. Myrard D. Ingram, Dresden, health officer of Weakley County for fourteen years has resigned to accept a similar position in Gibson County.—Dr. Joel J. Hobson is the new editor of the *Memphis Medical Journal* succeeding Dr. Arthur F. Cooper, who after serving in the position since 1934, has resigned to become full time medical director of the outpatient department of the John Gaston Hospital, Memphis.

TEXAS

Greater Medical Center in Dallas—On June 3 a dinner was held in the Baker Hotel by the Southwestern Medical Foundation to observe the establishment of the Greater Medical Center in Dallas. The project which is not completed represents a development financed by the foundation.

State Medical Election—Dr. Herschel F. Connally, Waco, was named president-elect of the State Medical Association of Texas at its house of delegates meeting in Fort Worth in May and Dr. Charles S. Venable, San Antonio, was inducted into the presidency. Vice presidents are Drs. Bertus C. Ball, Fort Worth, Thomas G. Glass, Marlin, and Solon D. Coleman, Navasota. Dr. Holman Taylor, Fort Worth, is secretary and Dr. Khleber H. Ball, Fort Worth, treasurer.

Library Develops Under Celsus Society—The San Antonio Public Library is cooperating with the Celsus Society to act as custodian of books and documents belonging to the society. The books, through the public library will become available not only to physicians but to any one who may have an interest in medical history. The first ten volumes of the *Bulletin of Medical History* have been bound and placed on the shelves set aside for the society and it is hoped that, as the society contributes to the collection, books and manuscripts will be received from persons elsewhere. The Celsus Society was recently organized by a group of San Antonio physicians for the study of the history of medicine. The constitution specified that the organization should be informal with only one officer, president-secretary, which office is now held by Dr. Lloyd I. Ross, San Antonio. A recent meeting of the society was addressed by Knox E. Miller, medical director, U. S. Public Health Service, liaison officer, eighth service command, who gave a paper on the "Origin of the Celsus Society," and Chauncey D. Leake, Ph.D., dean and executive vice president of the University of Texas Medical Branch, Galveston whose paper was entitled "Let's Not Forget the Great."

WASHINGTON

Dr. Westman Named Acting Health Commissioner of Seattle—Ragnar T. Westman, surgeon, U. S. Public Health Service Reserve, on April 29 was appointed acting commissioner of health of Seattle. The appointment was made to fill the vacancy that occurred when Dr. Frank M. Carroll, Seattle, resigned after holding the position for two terms of five years each.

WISCONSIN

Changes in Health Officers—Dr. Joseph D. Warrick has been appointed health officer of Sharon to succeed L. C. Kief who according to the state medical society recently pleaded guilty to a charge of practicing chiropractic at Sharon for the past ten years without a license.—Dr. Frederick C. Haney has been named commissioner of health of Watertown succeeding Dr. Harvey G. E. Mallow who has been commissioned a first lieutenant in the U. S. Army Air Force.

State Public Health Appointments—Dr. Stephen E. Gavin, Fond du Lac, has been appointed a member of the state board of health for a term expiring in 1950. The appointment of Dr. Gavin fills the last vacancy on the board. Other members include Drs. Stephen Cahana, Milwaukee, Carl W. Eberbach, Milwaukee, Albert E. Rector, Appleton, William T. Clark, Janesville, Gunnar Gundersen, La Crosse and Ira F. Thompson, Racine. Dr. Charles A. Dawson, River Falls, a member of the state board of medical examiners since 1941 has been named secretary of the board. Dr. Gundersen was recently elected president of the state board of health and Dr. Thompson vice president.

Prize Essay Contests—The Milwaukee Academy of Medicine announces two prizes of \$100 and \$50 for the two best scientific essays in any field of medicine surgery or the allied specialties in its Horace Manchester Brown Memorial prize essay contest. The essays need not represent original investigation but must not have been previously published. There are no restrictions on subsequent publication. The contest is open to all physicians who have graduated from medical school later than June 1933 and are residing in the state of Wisconsin or are in the armed forces at the time that the essay is submitted. All essays are to be submitted to the office of the academy of medicine, 501 North 15th Street, Milwaukee, not later than December 1. They are to be submitted in triplicate and are to be double spaced. In the Rogers Memorial Prize Essay Contest founded by the Rogers Memorial Sanitarium and sponsored by the Milwaukee Academy of Medicine, prizes of \$200 and \$100 for the two most meritorious studies in the fields of neurology, psychiatry and psychosomatic medicine will be offered. The contest is open to all members of the medical profession who are citizens of the state of Wisconsin whether they are actually in residence or not and to those who, not

ordinarily residents of the state, are stationed in Wisconsin in the armed forces. All papers must be submitted in triplicate and double spaced to the office of the academy of medicine not later than October 1.

GENERAL

Exposition of Chemical Industries—The nineteenth Exposition of Chemical Industries will be held at Madison Square Garden, New York, December 6-11.

Courses in Prevention of Blindness—The National Society for the Prevention of Blindness announces that the elementary courses for the preparation of supervisors, teachers, nurses and others concerned with the education of partially seeing children will be conducted at Wayne University, Detroit, June 21-July 30, at Michigan State Normal College, Ypsilanti, Mich., June 21-July 30, and at Teachers College, Columbia University, New York, July 6-Aug. 13. An advance course will also be carried out at Wayne University, June 21-July 30.

Awards to Women—The American Association of University Women recently announced the following fellowship awards among others:

Dr. Yvonne Parigot de Souza, Parana, Brazil, \$1,500 to study advanced histories at Columbia University and observe child clinics and social welfare centers on methods of organizing for maternal and child welfare.

Her return to Brazil. Dr. Parigot de Souza will set up a standard maternity center.

Elizabeth Z. Burkhardt, Ph.D., Clarksville, Ark., to continue her research on endocrinology at the University of Chicago.

Leah Gold, M.A., dental hygienist in the public schools of New Haven, Conn., the Marion Talbot Fellowship to conduct research in the effectiveness of specific dental hygiene methods among students of junior high school age.

Dr. David R. Lyman Awarded Trudeau Medal—Dr. David Russell Lyman, Wallingford, Conn., was presented with the Trudeau Medal for 1943 of the National Tuberculosis Association at its annual meeting in St. Louis, May 5-6. The medal is awarded annually to one who is outstanding in the campaign against tuberculosis. Dr. Lyman is one of the founders of the association and has been continuously active on the board of directors and on numerous committees having had at one time been president. He is currently medical superintendent of the Gaylord Farm Sanatorium at Wallingford. Dr. Frederick H. C. Heise, Trudeau, N. Y., was chosen president-elect of the association and Dr. Lewis J. Moorman, Oklahoma City, was installed as president. Dr. Charles J. Hatfield, Philadelphia, is secretary and Livingston Platt, New York, lawyer, treasurer. Daniel C. McCarthy, for a number of years director of public relations of the association, has resigned, effective June 13, to become assistant director of public relations of the Firestone Tire & Rubber Company, Akron, Ohio.

Board of Obstetrics and Gynecology—Applications for the 1944 examinations of the American Board of Obstetrics and Gynecology are being received at the office of the secretary, Dr. Paul Titus, 1015 Highland Building, Pittsburgh. All applications for the year 1944 must be received by Dr. Titus not later than Nov. 15, 1943, ninety days in advance of the Part I examination date. Candidates are required to take both Part I and Part II examinations. The Part I examination consists of the written paper and the submission of twenty-five case history abstracts and will be conducted on Saturday, Feb. 12, 1944. This examination will be arranged so that the candidate may take it at or near his place of residence. On the successful completion of the Part I examination, candidates are eligible for the Part II examination, consisting of a pathology and an oral examination. This is given at the annual meeting of the board once each year, the time and place of which will be announced later. The Office of the Surgeon General of the U. S. Army has issued instructions that men in service eligible for board examinations be encouraged to apply and that they request orders to "detached duty" for the purpose of taking the examinations whenever possible.

Help Wanted—A new sound film entitled "Help Wanted," presenting basic first-aid information, has just been released by the Bureau of Mines, Department of the Interior. The film is in 16 mm. sound and runs thirty minutes. Copies are now available for exhibition by industrial and civil defense training classes, training courses conducted by or on behalf of the army, navy and maritime service and by schools, churches, colleges, civic and business organizations and other similar groups. In "Help Wanted" effective use is made of animated diagrams superimposed over actual photographs to show blood circulation, pressure points for staunching the flow of blood from a wound and the effect of proper treatment of bleeding. The film also portrays typical mishaps causing bleeding wounds, shock, burns, asphyxiation, fractures and other injuries and methods of treating them. Opening scenes show the patient

entering an operating room and the doctor being questioned about the accident by a news reporter. The doctor emphasizes the value of a working knowledge of first aid and proceeds to give instructions in fundamental applications. Application for free loan of "Help Wanted" should be addressed to the Graphic Services Section, Bureau of Mines, 4800 Forbes Street, Pittsburgh, and should state specifically that the borrower has a sound projector. Although no charge is made for use of the film, the exhibitor is expected to pay transportation charges both ways and for loss or damage other than normal wear.

Social Hygiene Field Representatives Appointed—The American Social Hygiene Association is assigning field representatives in each of the nine army service commands to handle all activities in the development or expansion of a social hygiene program for these areas. The association is working closely with the army, navy, public health service and social protection section of the Office of Community War Service and all official and voluntary agencies. Four field headquarters have been established and by fall it is expected that the remaining five will be operating. The new units are:

Second Service Command (New York, New Jersey, Delaware), American Social Hygiene Association, New York.

Third Service Command (Pennsylvania, Maryland, Virginia, District of Columbia), Dr. Charles H. Mincer, in charge, 603 North Charles Street, Baltimore.

Fourth Service Command (North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Mississippi and Louisiana), Dr. Thomas A. Storey, in charge, and Mrs. Edna W. Fox, assistant, Georgian Terrace Hotel, Atlanta.

Fifth Service Command (Texas, Oklahoma, New Mexico and Arizona), Bracom Johnson Jr., passed assistant surgery U. S. P. H. S., in charge, Cliff Towers Hotel, Dallas, Texas.

The field service is under the direction of Dr. C. Walter Clarke, New York, executive director of the American Social Hygiene Association.

CANADA

Tuberculosis Survey of Newspaper Employees—Early in May the first mass survey of the employees of a newspaper in Canada was launched by the tuberculosis prevention division of the Ontario Health Department. This first examination of newspaper employees was an effort to cooperate with the department's plans to take roentgenographic examinations of all people in the province, beginning with every one engaged in industry.

FOREIGN

Sir Frederick Hopkins Retires—Sir Frederick Gowland Hopkins, professor of biochemistry at Cambridge University for almost thirty years, has announced his retirement, newspapers reported, April 12. Sir Frederick, who received the Nobel Prize for medicine in 1929, is noted for his research in vitamins. He is 82 years of age.

East Asiatic Medical Congress in Tokyo—According to a short wave broadcast from Berlin, April 23, the second East Asiatic Medical Congress was held in Tokyo recently with three hundred delegates from all countries of East Asia. Participating in this congress were seventy lecturers who covered the treatment of tropical diseases, malaria and tuberculosis, the raising of the standard of living in the southern territories and the food problems in Manchuria. The congress voted to establish branch medical organizations in Burma, Malaya, East India and the Philippines. The Chinese capital city Nanking was chosen for a similar congress to be held next year.

Personal—The Faculty of Medicine of the University of Berne has conferred the degree of doctor of pharmacy, *honoris causa*, on Arthur Stoll, Basel, Switzerland, in recognition of "his contributions to the chemistry of medicinal plants." *Science* reports that Dr. Stoll was first to describe new methods to isolate active principles of drugs heretofore available only in the form of unstable galenicals. The isolation in pure form of such principles has only widened their therapeutic application but opened entirely new indications owing to specific actions not obtainable with the crude drug (i. e., ergotamine). This is the first time that the faculty of medicine of the University of Berne has conferred this honorary degree. The William Julius Mickle Fellowship of the University of London has been awarded to Edward C. Dodds, D.Sc., Courtauld professor of biochemistry, at the Middlesex Hospital Medical School. Dr. George H. Macnab has been appointed dean of the Westminster Hospital Medical School, London, to succeed Sir Adolphe Abrahams, who has retired. Sir Henry H. Dale, president of the Royal Society and director of the laboratories of the Royal Institute of Great Britain with the fullerton professorship of chemistry, has been awarded the Harben Gold Medal of the Royal Institute of Public Health and Hygiene, London, according to *Science*.

Introduction of an Appointments System for Hospital Outpatients

One of the drawbacks of treatment at the outpatient departments of hospitals is the long period of waiting, running to hours, which patients have to endure. Such loss of time is felt more severely in this war period, when there is shortage of labor of all kinds. The obvious remedy of an appointments system is now being introduced. It has existed for fifteen months for all patients, both new and old, at Guy's Hospital, which dealt with 75,000 cases in 1942. New patients or their doctor may book an appointment by personal visit, by letter or by telephone to the sister in charge of the outpatient department. Old patients at each visit book appointments for the next visit. Appointments are made in hourly blocks. Thus no patient should have to wait longer than an hour before seeing the doctor. The number of appointments per hour is much less for members of the teaching staff, so as to allow time for teaching, than it is for those made for house officers, who do not teach.

The appointment system has other advantages than the saving of the patient's time. It gives him the desirable impression that he is an individual and not merely one of a crowd. It relieves congestion in the outpatients hall. It permits the nurse to prepare more efficiently for the management of the session. It allows alteration in the time table to be made at short notice. It renders restriction possible in the number of cases seen at any one session and therefore allows the attending physician to plan his day better.

A European Association of Clinical Pathologists to Be Formed

Among the refugees in this country from Germany are many physicians. They have found our institution of clinical pathologists worth imitating. A meeting has been held in the Medical School of University College, London, which was attended by about thirty physicians, women as well as men drawn from Austria, Belgium, Czechoslovakia, Britain, Hungary, Italy, Poland and Russia. Dr F Pick of Prague called on Dr S C Dyke, former president of the British Association of Clinical Pathologists, to explain how clinical pathology was organized in this country.

Dr Dyke said that clinical pathology, though a special branch of medicine, was within itself unspecialized and had relations with all branches of clinical medicine. Owing to the relatively unspecialized nature of its proceedings the meetings of the British Association of Clinical Pathologists formed a peculiarly happy ground for the exchange of views between practitioners of the various branches of medicine. He then moved from the chair that there be formed a European Association of Clinical Pathologists.

Prof E J Bigwood of Brussels stressed the importance of establishing contacts between clinical medicine and the laboratory. Dr M Maizels hoped that after the war an interchange of laboratory workers between clinical pathologic laboratories in Britain and on the continent would be arranged. Dr Dyke then read a letter from the president and council of the British association offering the hospitality of all its meetings to the members of the European association. He emphasized the need for a class of physicians capable of taking charge of hospital laboratories. He had found medical laboratory workers from the continent specialized to a degree that made it difficult for them to do this. The meeting appointed a committee consisting

of Drs B L Della Vida of Rome and M Mandelbaum of Munich, F Pick of Prague, F Silberstein of Vienna, J Ungar of Prague and Dr S C Dyke of Oxford to draw up rules.

Heroism of a Naval Surgeon

When the Canadian corvette *Wylburn* was sunk by an underwater explosion the survivors were rescued by a destroyer. A surgeon lieutenant was standing on the destroyer's deck helping survivors from the water, when another explosion occurred and broke both his legs below the knee, with those or more than half a dozen others. He was dazed for a few minutes and then refused to be carried to a cot in the wardroom. He was carried around the deck by three men while he attended the slightly injured there. Then he ordered the men to take him to the wardroom, which was filled with men injured by the second explosion. By each cot he was placed in a sitting position on the floor. He examined the patients and gave orders for treatment to the sick bay attendant. In spite of the pain he suffered every time his legs were moved, he insisted in carrying on without rest. Only when every examination had been made did he allow himself to be placed in a chair, with his legs stretched out straight in front of him for what small measure of relief was possible. He still refused to stop work and sat in the chair for twelve hours until the destroyer reached port, directing the treatment of several men seriously wounded or burned. Doctors and attendants from a shore hospital came on board, and as the procession of stretchers began to move off the ship he called for one for himself. His heroism in attending for more than twelve hours more than 50 wounded or otherwise injured with both his legs broken has been much commended in the press. He is Surg Lieut P R C Evans, the son of a North Wales physician, and is 25 years of age.

Scarcity of Desoxycorticosterone Acetate Physicians Enjoined to Prescribe It Only in Addison's Disease

The Therapeutic Requirements Committee of the Medical Research Council has drawn attention to the need for strict economy in the use of desoxycorticosterone acetate. This is an essential drug for the treatment of Addison's disease, and the supplies available are sufficient only for this purpose. There is no evidence that this substance is essential for any other condition. Physicians are therefore urged not to prescribe desoxycorticosterone acetate for any patients except those suffering from Addison's disease.

Married Nurses Return to Their Profession

The shortage of nurses due to the war is so great that married nurses are returning to their profession. The National Society of Children's Nurseries in conjunction with the Royal College of Nursing and the Association of Sick Children's Hospital Nurses is holding a course in London for nurses who are eligible for the position of matron or sister in wartime nurseries. These posts are suitable for qualified nurses who are married. If they have young children, provision can be made for their care. The course of instruction is under the auspices of the Ministry of Health and is free to registered nurses who intend to take up the work in nurseries.

Experience of a Man Who Lived 130 Days on a Raft

Mr Noel Baker parliamentary secretary to the Ministry of War Transport has reported the story of a Chinese seaman whose ship was torpedoed in midocean in the darkness of the night. After swimming about for some time he grabbed hold of a raft, on which he climbed. Emergency rations kept him going for sixty days. He then had become expert in catching fish and birds and rigged up an equipment to catch rain water so that he was able to subsist until rescue on the one hundred and thirtieth day brought an end to what is described as the most incredible experience in history.

Automatic Regulation of Blood Pressure
and Arterial Hypertension

Prof Dr C Heymans of Ghent, Belgium, discussed the automatic regulation of blood pressure and arterial hypertension before the Medical Society of Basel, Switzerland. Although the factors which control the blood pressure (heart minute volume, arterial chamber, current resistance of the arterioles and circulating quantity of blood) are changeable, the level of blood pressure is to some extent constant. This is due to an automatic regulation. Pressoreceptors register the pressure at various sites in the vascular system, they conduct nervous impulses elicited in this manner, to the central nervous system and there elicit blood pressure regulating reflexes. The most important pressoreceptors are the terminations of the depressor nerve in the left side of the heart and in the aorta and the sinus carotici at the ramification of the internal and external carotid. Then there are pressoreceptors in the pulmonary arteries and veins, in the venae cavae and in the intestinal arteries. The reflexes which regulate the blood pressure have their points of attack on the heart, the blood vessels, the epinephrine formation of the adrenals and on the blood depots.

The function of the sinus carotici was analyzed with the method of crossed circulation as well as by varying the pressure in the isolated sinus carotici. If the pressure in the sinus carotici rises, the general blood pressure decreases at once. The registration of the action currents of the depressor nerve as well as of the nerve of the sinus carotici shows action current salves at each systole. The significance of the intestinal arteries for the blood pressure regulation can be demonstrated likewise by means of crossed circulation, after exclusion of the sinus carotici and of the aortic nerve. The functional significance of the terminations of the pulmonary nerves has not been experimentally demonstrated as yet. The aortic arch and the sinus carotici react not only to pressure changes but also to chemical stimuli such as acetylcholine, nicotine, lobeline and carbon dioxide, however, the receptors for the two stimuli are not identical. Whereas the pressoreceptors are located in the vascular wall itself, the chemoreceptors are in the glomus located beside the arteries. The chemoreceptors have an important function in the reflex regulation of the respiration.

The pressoreceptors send impulses to the center not only when the blood pressure changes but continuously. If the four pressoreceptor nerves are excluded, the pressure in a comparatively short time increases to over 200 mm of mercury and stays continuously at this elevated level (observation up to six hundred days). A neurogenic, arterial hypertension is the result. The neurogenic nature is proved by the fact that, after total sympathectomy, hypertension no longer persists.

This form of hypertension is related to essential hypertension in which the removal of parts of the sympathetic nervous system likewise has a reducing effect, but it has also connections with the kidney. According to Goldblatt's experiments, an ischemia of the kidneys resulting from clamping off of the renal arteries leads to chronic arterial hypertension.

Substitutes for Tincture of Iodine

As the result of a deficiency in raw materials, Switzerland has difficulties in supplying its population with medicines. It has been found that the use of iodine preparations and medicines which contain iodine must be greatly restricted. The available supply can be saved to a great extent by using tincture of iodine sparingly. As a disinfectant or an anti-inflammatory remedy, tincture of iodine is readily replaceable. An inquiry of the Swiss Health Office of Swiss clinics and large hospitals revealed

for instance that, for the preparation of the surgical field, picric acids can be utilized in a 1, 2 or 5 per cent alcoholic solution, likewise a 2 per cent alcoholic solution of mercurochrome. Tincture of iodine has lost its significance as an anti-inflammatory remedy and painting of the skin with iodine can now be dispensed with. The Swiss Health Office arrives at the conclusion that great savings of tincture of iodine are possible without harming patients.

Brief Reports

A new periodical, *Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, has appeared recently in Switzerland. It is edited by Dr W Morgenthaler of Muri-Bern, Prof Dr J Piaget of Geneva and Lausanne, Prof Dr C G Jung of Kuesnacht-Zürich and Dr O Forel of Prangins-Nyon. The periodical is published by Hans Huber of Bern.

At the suggestion of Prof Dr Grumbach of Zürich a Swiss Society for Microbiology has been founded, which recently held its first meeting in Lausanne. The main lecture was given by Prof Hermann Mooser of Zürich, who spoke on the various methods of vaccination against spotted typhus. Grumbach spoke about *Enterococcus*.

A Swiss Paracelsus Society has been founded by research workers interested in Paracelsus. The society has the purpose to investigate the work of Paracelsus and its influence on the various branches of science (philosophy, natural sciences and medicine). The investigations are to be published under the title "Nova Acta Paracelsica". Dr Linus Birchler, who is professor of the history of art at the Technical University in Zürich, was chosen president of the society.

The Swiss congress has granted to the International Committee of the Red Cross a contribution of three million Swiss francs, so that it can continue its activity completely unhampered. In September 1939 the first donation of two hundred thousand Swiss francs had been granted.

The Marcel Benoist-Prize for 1942 was awarded to Prof Dr Hermann Mooser, who is director of the Hygiene Institute of the University of Zürich. Dr Mooser received the prize for his researches on spotted typhus. (See THE JOURNAL of Feb 19, 1938, p 591, for information about this prize.)

Dr L M Pautrier was elected to the chair of dermatology and director of the Dermatologic Clinic of the University of Lausanne to succeed Prof Edwin Ramel, who died recently. Pautrier was formerly director of the Dermatologic Clinic of the University of Strasbourg.

Doctor of Jurisprudence Jacques Brodbeck-Sandicuter, president of Ciba, the pharmaceutical house, was made an honorary doctor of medicine by the faculty of medicine of the University of Basel on the occasion of his sixtieth birthday. Dr Brodbeck has done much to promote studies on the history of medicine and recently made another contribution of a hundred thousand Swiss francs for this purpose.

Marriages

EDWIN NEWTON IRONS, Chicago, to Miss Mary Elizabeth Spring of Crookston, Minn., April 27

STANLEY F SMAZAL, Townsend, Mont., to Miss Helen Donahue of Davenport, Iowa, May 10

FRANCIS W HENNINGS, Dickinson, N D., to Miss Beth Barnes of Seattle, recently

FRANK MERCURIO, New York, to Miss Ann Marie Rossi of Downingtown, Pa., May 10

PAUL H PERNWORTH, Venice, Ill., to Miss June Holt of Granite City, recently

ALBERT BEHREND to Miss Elsa Lowenstein, both of Philadelphia, April 3

Deaths

Arthur Dean Bevan ☉ Lake Forest, Ill, eminent surgeon, leader in medical education and former President of the American Medical Association died on June 10 at his home at the age of 81 of acute myocardial failure precipitated by an acute respiratory infection.

Dr Bevan was born in Chicago on Aug 9, 1861. He completed his studies at the Sheffield Scientific School of Yale University in 1879. After graduating at Rush Medical College in 1883 Dr Bevan joined the U S Marine Hospital Service, where he served until 1888. For one year in 1886, he was professor of anatomy at the University of Oregon Medical School, Portland, but returned to Rush in 1887 to serve until 1889 as professor of anatomy. He was associate professor of surgery from 1889 to 1902 when he became professor of surgery. In 1907 he was made head of the department and in 1934 was named Nicholas Senn professor of surgery. Shortly after his retirement as head of the department of surgery at Rush Dr Bevan's portrait was presented to the college. At the time of his death Dr Bevan was a member of the board of trustees of Rush.

Through his long association with Rush Dr Bevan maintained a close affiliation with the Presbyterian Hospital joining the staff in 1892 as attending surgeon and serving from 1894 until 1934 as head of the surgical service. He was consultant at the time of his death. In 1929 he with his wife announced a million dollar gift to the hospital for its expansion program and principally for the provision of medical services.

On March 14, 1923 Dr Bevan performed in Presbyterian Hospital the operations in which ethylene oxygen was first used clinically as an anesthetic. In 1931 he presented a paper before the American Medical Association entitled 'Present Status of the Anesthesia Problem' in which he discussed the scheme which had been devised to prevent the possibility of static spark in the operating room. His interest in surgery evolved many procedures including the S shaped incision for surgical operations on the liver and bile tracts and the 'hockey stick' incision to expose the gallbladder without cutting through important nerves.

In 1902 Dr Bevan was appointed by President Wyeth chairman of the original committee on medical education. In 1904 when the Council on Medical Education was created, Dr Bevan was chosen the first chairman and occupied the position until 1928. The one interruption to his work on the Council was his service as President-Elect and President of the American Medical Association in 1917-1919. In recognition of his services as President of the Association during World War I Dr Bevan was made an officer in the Legion of Honor of France. He was a member of the House of Delegates of the Association from 1902 to 1903 and chairman of the Section on Surgery and Anatomy in 1906-1907.

At one time he served as surgeon and major in the Oregon National Guard and director of general surgery in the surgical division of Surgeon General Gorgas's office in Washington. His surgical affiliations were many including membership in the American Urological Association, the American Association of Anatomists and the Society of Clinical Surgery. He was a founder and a member of the first board of governors of the American College of Surgeons. He was president of the Chicago Medical Society in 1898, of the Inter-State Postgraduate Medical Association in 1931 and of the American Surgical Association in 1932. He was a member of the founders group of the American Board of Surgery and held at various times many positions in the American Society for the Control of Cancer.

Dr Bevan's numerous contributions to the literature were not confined to his specialty. In addition to the many monographs on scientific subjects Dr Bevan had written many articles reflecting his early interest in medical education, the prohibition movement and other subjects.

Dr Bevan was a man with a driving personality. A forceful character gave strength to his leadership for the advancement of medical education. His disdain of personal criticism and his fearlessness when attacked did much to promote the great success of the Council on Medical Education in achieving its objectives.

Frank B Lane, East Orange, N J. Eclectic Medical Institute, Cincinnati, 1886, president of the board of health of East Orange for sixteen years, formerly chairman of the joint milk commission of the Oranges, a member of the state board of medical examiners from 1894 to 1898, consultant on the medical staff formerly chief of staff and for many years chairman of the board of directors of St Mary's Hospital, Orange, a member of the board of governors of the Essex County Hospital for Contagious Diseases, Belleville, aged 83, died, April 8 in the Orange Memorial Hospital of cerebral hemorrhage.

Howard Johnston Bostetter, Mount Savage, Md. University of Maryland School of Medicine, Baltimore 1907, member of the Medical and Surgical Faculty of Maryland, on the staff of the Allegany Hospital of the Sisters of Charity, Cumberland, aged 61, died March 12 of coronary heart disease, arteriosclerosis and chronic nephritis.

James Barton Bradwell, Chicago, Hahnemann Medical College and Hospital, Chicago, 1902, aged 64, died April 8 in the Michael Reese Hospital of hypertension and congestive heart disease.

Henry F Bright, Alcester, S D. Columbian Medical College, Kansas City, Mo. 1899, aged 65, died March 22 of coronary thrombosis.

Warren P Brockett, Kansas City, Kan. Kansas Medical College, Medical Department of Washburn College, Topeka 1898, at one time secretary and treasurer of the Jackson County Medical Society, formerly a physician in the Indian Service at Mayetta, aged 72, died April 9, of coronary occlusion.

Frank Patrick Broderick ☉ Boston. Yale University School of Medicine, New Haven, Conn. 1898, aged 67, died February 26.

Pleasant Lewis Burgess, Bowdon, Ga., Southern College of Medicine and Surgery, Atlanta 1912, member of the Medical Association of Georgia, aged 60, died, March 14 of cardiovascular disease.

Charles Calerdine Crawford ☉ Cleveland. University of Wooster Medical Department, Cleveland 1905, also a pharmacist, one of the founders and member of the staff of the Glenville Hospital where he had been president and treasurer of the staff and president of the board of trustees, aged 62, died April 10, at his home in University Heights, Ohio of heart disease.

William Henry Ewing, Pittsburgh. Western Pennsylvania Medical College, Pittsburgh 1893, member of the Medical Society of the State of Pennsylvania, at one time on the staff of the Rememan Hospital, aged 78, died April 5 of cerebral thrombosis.

George Wallace Fennacy, Kankakee, Ill. Bellevue Hospital Medical College, New York 1885, aged 76, died March 13 of coronary sclerosis.

William Rhodes Ferrell, Belle Mo. St. Louis College of Physicians and Surgeons 1892, member of the Missouri State Medical Association, past president of the Gasconade-Marion-Osage Counties Medical Society, medical examiner for the draft board, aged 75, died, March 20, of heart disease.

ARTHUR DEAN BEVAN, M.D., 1861-1943

Louis Fichter, New York, Columbia University College of Physicians and Surgeons, New York, 1904, formerly a member of the city police department and board of health, at one time on the staff of the German Hospital, aged 60, died, March 22, in Stamford, Conn., of septicaemia, peritonitis and intestinal neoplasm.

John L. Freeland, Gadsden, Colo., Medical College of Ohio, Cincinnati, 1885, formerly a member of the city board of health of Indianapolis and the Indiana State Board of Health, at one time superintendent of the City Hospital, Indianapolis, aged 82, died, April 4, in Denver.

John O. Garrigus, Terre Haute, Ind., Medical College of Indiana, Indianapolis, 1905, member of the Indiana State Medical Association, served several terms as coroner of Vigo County and at various times as deputy coroner, formerly police surgeon, aged 69, died, April 2, in the Union Hospital of paralysis agens and arteriosclerosis.

Bernard Joseph Gretsche, New York, Columbia University College of Physicians and Surgeons, New York, 1901, member of the Medical Society of the State of New York, aged 70, died, April 2, of heart disease.

John H. Guthrie, Kress, Texas (licensed in Texas, under the Act of 1907), also a druggist, aged 67, on the staff of the Floydada (Texas) Hospital and Clinic, where he died, March 31, of cardiovascular vascular disease.

Philip Halpern, Philadelphia, Hahnemann Medical College and Hospital of Philadelphia, 1932, aged 41, died recently of gastric carcinoma with metastases.

William Hansell Ⓢ Ottumwa, Iowa (licensed in Iowa in 1892), an Affiliate Fellow of the American Medical Association, on the staffs of the Ottumwa and St. Joseph hospitals, aged 88, died, April 6, of uremia and chronic nephritis.

Hill Wright Howell, San Francisco, University of Nashville (Tenn.) Medical Department, 1909, member of the Medical Association of the State of Alabama, served during World War I, at one time associated with the U. S. Veterans Bureau, Birmingham, Ala., major, medical corps, Army of the United States, not on active duty, aged 56, on the staff of the Veterans Administration Facility, where he died, March 1, of coronary thrombosis.

Howard Wakefield Jewett, Lowell, Mass., Hahnemann Medical College and Hospital of Philadelphia, 1905, member of the Massachusetts Medical Society, aged 63, senior member of the medical staff of the Lowell General Hospital, where he died, March 18, of pyonephrosis.

William Finney Kellam, Onley, Va., Johns Hopkins University School of Medicine, Baltimore, 1906, president and director of the Farmers' and Merchants' National Bank of Onley, a director of the Eastern Shore Public Service Company, member of the state board of fisheries, aged 62, died, March 30, of angina pectoris.

Theodore Charles Koessel, Chicago, Bennett College of Eclectic Medicine and Surgery, Chicago, 1896, member of the Illinois State Medical Society, aged 70, died, April 20, of chronic heart disease.

Henry H. W. Kruse Ⓢ Rockford, Iowa, Thuringische Landesuniversitat Medizinische Fakultat, Jena, Thuringia, Germany, 1922, aged 52, on the staff of the Cedar Valley Hospital, Charles City, where he died, March 28, of carcinoma of the bladder.

Willis Gaylord Lewis, West Palm Beach, Fla., Jefferson Medical College of Philadelphia, 1890, aged 83, died, March 20, following a prostatectomy.

Clinton Eber McKinnis, Seattle, University of Michigan Department of Medicine and Surgery, Ann Arbor, 1908, aged 57, died, March 23, in a local hospital of pneumonia.

George Fremont Miller Ⓢ Belfast, Maine, Tufts College Medical School, Boston, 1908, past president of the Waldo County Medical Society, aged 66, died, March 22, of coronary thrombosis.

William Nelson Miller, Cold Spring, N. Y., University of the City of New York Medical Department, New York, 1895, health officer of Croton-on-Hudson for thirty-two years and school physician for twenty-two years, visiting obstetrician on the staffs of the Peekskill (N. Y.) Hospital and the Ossining (N. Y.) Hospital, for many years surgeon for the New York Central Railroad, aged 72, died, March 23, of cerebral hemorrhage.

John Patrick O'Brien, Jersey City, N. J., Georgetown University School of Medicine, Washington, D. C., 1936, aged 35, on the staff of the Medical Center, where he died, April 2, of heart disease.

Foster Holmes Platt, Brooklyn, University of Vermont College of Medicine, Burlington, 1915, member of the Medical Society of the State of New York, on the staffs of the Prospect Heights and Adelphi hospitals, aged 50, died, April 4, of coronary thrombosis.

Robert Allen Prichard, Boerne, Texas, University of Louisville (Ky.) Medical Department, 1893, aged 78, died, March 7.

George Frederick Puffett, Alta, Iowa, State University of Iowa College of Medicine, Iowa City, 1889, aged 78, died, March 1, of senile dementia.

James F. Reynolds, Bevely, Ohio, Columbus Medical College, 1887, aged 84, died, March 25, of heart disease.

Thomas Carter Richards, Fayette, Mo., Missouri Medical College, St. Louis, 1890, coroner of Howard County, aged 78, died, March 20, in the Veterans Administration Facility, Jefferson Barracks, of cerebral hemorrhage.

Samuel Schwartzman, New York, Cornell University Medical College, New York, 1903, aged 63, died, March 26, of heart disease.

Charles Thomas Slavin, Moravia, Iowa, Barnes Medical College, St. Louis, 1904, member of the Iowa State Medical Society, health officer, president of the school board, aged 70, died, March 31, of myocarditis.

Charles Weaver Stewart Ⓢ Newport, R. I., College of Physicians and Surgeons, New York, 1891, fellow of the American College of Surgeons, chief surgeon at the Newport Hospital, a director of the Newport Trust Company, aged 77, died, March 26, of chronic myocarditis.

Amer Mills Stocking, Macomb, Ill., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910, a retired minister, aged 84, died, March 31, in Bushnell of chronic myocarditis.

Elmer C. Thompson, Marked Tree, Ark., Kansas City (Mo.) College of Medicine and Surgery, 1923, served during World War I, aged 55, died, March 20.

John Philip Throenle, St. Bernard, Ohio, Pulte Medical College, Cincinnati, 1901, aged 74, died, April 3, of coronary disease.

Theodore Toepel Ⓢ Atlanta, Ga., Atlanta College of Physicians and Surgeons, 1899, past president of the Fulton County Medical Society, served as president of the Georgia League for Crippled Children, formerly director of physical training and hygiene in the public schools of Atlanta, on the staffs of the Crawford W. Long Memorial and the Grady hospitals, aged 73, died, March 12, of heart disease.

Honore D. Valin, Chicago, University of Vermont College of Medicine, Burlington, 1879, member of the Illinois State Medical Society, formerly on the staff of St. Peter (Minn.) State Hospital, aged 85, died recently at the Chicago State Hospital of hypertensive heart disease and chronic myocarditis.

Charles Layton Weitz Ⓢ Mount Vernon, N. Y., New York Homeopathic Medical College and Flower Hospital, New York, 1918, served as a first lieutenant in the medical corps of the U. S. Army during World War I, aged 46, on the visiting staff of the Mount Vernon Hospital, where he died, April 13, of nitric acid poisoning self administered.

DIED WHILE IN MILITARY SERVICE

Thomas Joseph Coonan Ⓢ Baltimore, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1925, major, medical reserve corps, of the U. S. Army, aged 41, died, Nov. 3, 1942, of meningitis.

Guy B. McArthur Ⓢ Medical Director, Captain, U. S. Navy, Coco Solo, Canal Zone, Washington University School of Medicine, St. Louis, 1917, entered the medical corps of the U. S. Navy Sept. 6, 1917, medical officer in command of the U. S. Naval Hospital, aged 52, died, March 18, near the U. S. Naval Air Station, Miami, Fla., as the result of an automobile accident.

Harvey Wave Miller Ⓢ Medical Inspector, Commander, U. S. Navy, Portland, Ind., Indiana University School of Medicine, Indianapolis, 1912, entered the medical corps of the U. S. Navy on July 5, 1921, served during World War I, aged 59, died, March 19, in the U. S. Naval Hospital, Corona, Calif., of coronary thrombosis while en route to a new assignment.

TYPHOID SHOCK THERAPY IN RENAL DISEASE

To the Editor—In the March 6 issue of THE JOURNAL, Taylor and Page report on the use of typhoid shock therapy in 2 cases of renal disease malignant hypertension and the nephrotic phase of chronic glomerulonephritis. From their results they conclude that this method of therapy is quite dangerous because of the evidence of severe renal irritation.

From their protocols one might possibly draw somewhat different conclusions. The doses of triple typhoid vaccine used in the case of malignant hypertension appear to be somewhat too high for a first dose. The use of a second dose so soon after the first (which had already produced signs of renal irritation) complicates any conclusions one might draw. The second case is approached more cautiously and might be termed a minor triumph for shock therapy. Six intravenous injections of intravenous typhoid vaccine cured a case of chronic nephritis of over five months standing. Hematuria and a low urea clearance do not seem to be excessive risks for such results.

During the past few years I have treated a number of seemingly hopeless cases of renal disease with typhoid shock therapy (chronic glomerulonephritis with and without edema or uremia periarthritis nodosa active glomerulonephritis associated with pyoderma and malignant hypertension). The results in some instances were gratifying. I have used the infusion method of administering this pyrogenic agent in an attempt to minimize the risk and prolong the fever.

The urinary changes noted by Taylor and Page are possibly similar to exacerbation of a focal infection when the causal mechanism is tapped. In other chronic infections such as arthritis this is considered to be an encouraging sign. Renal irritation occurring with cautiously administered typhoid shock therapy might also fall into this category. One hesitates to condemn a technic which offers the hope of brilliant results in what are otherwise hopeless cases.

TETANUS IN THE MIDDLE EAST

To the Editor—The editorial comment "Tetanus in the Middle East" (THE JOURNAL, April 3, p. 1157) cites the experience with this disease in a section of the British army. Because of the finding that 5 patients who had received tetanus toxoid subsequently developed tetanus, the article affirms the impression of the British workers, stating that "From these figures active immunization while effective in preventing tetanus apparently has definite limitations." This statement is of course entirely true and needs no confirmation. But as it is stated the statement may result in misunderstanding.

In the first place no one familiar with immunologic processes expects 100 per cent protection following an immunization procedure. The biologic individuality of human beings (like other animals) is such that occasional subjects will fail to respond to any given immunization procedure, as has been well established in many studies covering various types of immunization. This property is of course not peculiar to immunization or to the animal kingdom for that matter—duds occur among bombs, automobile tires, vegetable seeds or what you will. Consequently no surprise or change in point of view should be occasioned by learning that a few cases of tetanus occur among the soldiers in the British or any other army.

Secondly the results reported by the British authorities must be differentiated from those which may be expected in the United States Army since the immunization procedures are different in the two armies (London Letter, J. D., April 17).

Of the 5 cases of tetanus mentioned I was incompletely reported in 3 there were only two initial immunizing doses of tetanus toxoid and only in 1 was a subsequent booster dose of toxoid given as well as the initial doses. In the American Army the official procedure (Circular Letter 34 S G O Long A P Tetanus Toxoid Its Use in the United States Army, *Im J Pub Health* 33:53 [Jan] 1943) is to give two initial doses of fluid toxoid three weeks apart a stimulating dose one year later or on departure for a theater of operations and an emergency stimulating dose on the occurrence of wounds, severe burns or other circumstances in which the danger of tetanus is a possibility. This American procedure can be expected to give a higher percentage of protection than the earlier British procedure on which the results referred to were based.

GEOFFREY EDVALL, M.D., Boston

COUNTY SOCIETY PROPOSES CASH SUBSIDY FOR FAMILIES OF SERVICE MEN

To the Editor—The council of the Wayne County Medical Society announces its course of action relative to the program of maternal and pediatric care for wives and infants of enlisted men projected by the government under H. R. 1975 and proposed to be administered by the state department of health.

The council believes that all the families of men in military service requiring assistance for any of the necessities of life should receive a direct contribution from the federal government and that the money thus appropriated should be paid directly to those for whom it was intended, namely the wives and children of men in the armed forces.

The council believes that the proposed plan under H. R. 1975 is inadequate in its scope because it is restricted to one particular condition in the mother and to the care of children up to only 1 year of age furthermore that it should not be administered by the state health department because among other things the service should be handled uniformly by an authority that functions actively in every county of Michigan and in many counties there are no health departments.

The council suggests that the program can be administered most readily and without overlapping personnel and new red tape either by the army through the established procedures of paying dependency allowances or through the functioning Army Emergency Relief organization. Simplified procedures and essential records to a great extent already exist in these organizations and assistance is paid directly in the form of cash benefits to those for whom it is intended. Contact so far with personnel of the Army Emergency Relief organization shows that it is favorable to the idea and can function as stated. From the standpoint of the mother this system would be preferred because she already understands it to say nothing of time and effort saved and the fact that she is not classified as an indigent nor is the implication given as in the present proposal that she cannot be trusted with the cash benefit.

If the foregoing is impossible at present the council calls attention to the already existing facilities in Michigan that administer medical and hospital assistance, namely the State Social Aid and Welfare Commission, the Michigan Crippled Children Commission and the American Red Cross.

The council objects to the intrusion of federal politics and federal domination in the field of curative medicine through the use of the state department of health the concern of which should be solely in the field of preventive medicine.

Report of this action is being sent to the governor and the members of the state administrative board to the American Medical Association to all county medical societies in the state of Michigan and to the National Physicians Committee.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Medical Practice Acts Application of Colored Lights as the Practice of Medicine—Dinshah P. Ghadiali developed "Spectro-Chrome-Metry" as "an original science" by the application of which, according to his claims, while he "does not cure or attempt to cure disease," he can "'tonate the imbalance' of the human body by attuned color waves supplied by an appliance called a 'Spectro-Chrome,'" for which he has obtained a United States patent. The specification filed in the United States Patent Office for that invention stated that the invention "relates to a color wave projection apparatus intended primarily for use in the treatment of diseases by means of color waves emanating from selected portions of the spectrum." Any "imbalance," so Ghadiali claimed, "can be 'tonated' by the proper use of the Spectro-Chrome." Ghadiali wrote a so-called "Spectro-Chrome-Metry Encyclopaedia," which discusses treatments for "most major diseases." These cures, Ghadiali claimed, are effected by exposure of the affected part of the body to colored lights emanating from the Spectro-Chrome.

It was Ghadiali's practice, affixing in advertising circulars after his name the title "(Honorary) M.D. Metaphysician and Psychologist," to conduct an itinerant series of courses in the alleged "original science" he had developed. So-called pupils would enroll, according to the forms they signed, "for the study of Spectro-Chrome-Metry, The Science of Automatic Precision, the Measurement and Restoration of the Human Radio-Active and Radio-Emanative Equilibrium (Tonation of Imbalance) by Attuned Color Waves, without the use of Diagnosis, Drugs, Manipulation or Surgery." There was evidence that some, if not most, of the "students" enrolled with the thought that their personal diseases and ailments

would be "benefited" by the course. During the course each student would be given a Spectro-Chrome and a copy of the encyclopedia written by Ghadiali. As a result of conducting one of these courses in Delaware, Ghadiali was prosecuted for violating the medical practice act of Delaware in that without having a license to practice medicine and surgery he (1) recommended the use of an appliance for the cure, relief or palliation of ailment or disease of mind or body and (2) used the letters M.D. in connection with his name, implying or designating him as a practitioner of medicine. He was found guilty and the conviction was affirmed by the Supreme Court of Delaware in an unreported opinion. A writ of certiorari was denied by the Supreme Court of the United States *Ghadiali v. Delaware*, 292 U.S. 653, 54 S. Ct. 864, 78 L. Ed. 1502. Subsequently, without the aid of an attorney, he instituted an action in the federal district court, district of Delaware, to enjoin the Delaware state medical society, the attorney general of the state and other defendants from preventing him from lecturing on the subject of the alleged science he developed, which restraint, so he alleged, interfered with his constitutional rights as an American citizen.

Ghadiali did not point out any particular article of the United States Constitution on which he relied, aside from the provisions of the constitution authorizing the Congress to enact laws relating to the patenting of inventions. The court concluded, therefore, that he based his case in chief on the provisions of the fourteenth amendment relating to the right of freedom of speech. He attacked the Delaware medical practice act as unconstitutional, asserting in effect that he has the right to say what he pleases. He contended that what he had done and what he intended to do in the state of Delaware did not constitute the practice of medicine. The rights conferred by the constitution, answered the court, are not absolute and the right of freedom of speech must be so governed as to insure orderly and law-abiding living. The police power is reserved explicitly to the states by the tenth amendment. The health of the citizens of a state is a proper subject for the exercise of that power, and a state may license the practice of medicine within its borders in aid of public health. A state may define what constitutes the practice of medicine, and the provisions of the Delaware medical practice act defining the practice of medicine are reasonable and present no substantial questions of constitutionality.

The next question, then, said the court, is Has the state of Delaware applied the medical practice act arbitrarily to Ghadiali? He is not a physician or a surgeon. He claims that he does not hold himself out as a physician. He contends that he does not diagnose illnesses, cure sickness or treat ill persons but that he merely sells his patented appliance, the Spectro-Chrome, and therefore is not engaged in the practice of medicine. Nevertheless, he claims that the Spectro-Chrome can "tonate" the "imbalance" of the body, that is to say, in medical phraseology, that the Spectro-Chrome applied in accordance with his teachings will cure disease. Thus, although Ghadiali claims to be a mere purveyor of machines, he in effect prescribes methods of treatment for disease. It is immaterial that he disdains the conventional words "disease" and "cure" and that he disavows the profession of a physician though making use of the words "(Honorary) M.D." after his name. He offers Spectro-Chrome-Metry as a substitute for medicine for the cure of disease. Since he was not licensed by the state of Delaware, he was acting in violation of the statute prohibiting the practice of medicine without a license, and his prosecution and conviction did not deprive him of his right of freedom of speech without due process of law.

The court accordingly dismissed the proceedings, in effect, leaving the law enforcement officials of Delaware free to proceed against Ghadiali if he continues his activities in the state.—*Ghadiali v. Delaware State Medical Society*, 48 F. Supp. 769 (1943)

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Heart Disease in the Argentine P. Cossio Buenos Aires Argentina —p. 145

*Patency of Ductus Arteriosus in Adults A. Keys and M. J. Shapiro Minneapolis —p. 153

*Results of Surgical Treatment of Patency of Ductus Arteriosus Complicated by Subacute Bacterial Endarteritis A. S. W. Touroff New York —p. 157

Physiologic Definition of Acute Congestive Heart Muscle Failure G. Fahr and M. S. Buehler Minneapolis —p. 211

Hemiplegia Following Bradycardia and Cardiac Standstill A. T. Steegmann Kansas City Mo. and H. Feil Cleveland —p. 244

Patency of Ductus Arteriosus in Adults—There exist records of 134 patients who have had operations for ligation of the duct, nearly half of these have not been reported except by personal correspondence to Keys and Shapiro. Patency of the ductus arteriosus is apparently much more common than was previously believed. The authors themselves have studied 51 such patients in the Minneapolis and St. Paul area. Brief notes are given on 57 adults with postmortem examinations who had simple, typical patency of the ductus arteriosus; a few data on 10 adults with atypical patency of the duct and 4 case reports of adults with postmortem examinations who had simple patency of the duct. In simple patency the cause of death was subacute bacterial endarteritis in more than 40 per cent. 28 per cent died of congestive failure. The death of 2 patients resulted from rupture of a pulmonary aneurysm. After the age of 17, patency of the ductus arteriosus was associated with an average reduction of life expectancy of about twenty-five years. While life lasts it is fairly normal. Right and left sided cardiac hypertrophy occurs but there is no enlargement in at least 10 per cent pulmonary aneurysms are present in about 15 per cent, atheromas and calcareous plaques occur frequently and the aorta is involved almost as often as the pulmonary artery. The ductus was usually short, and in some it was represented by a fistula-like communication between the aorta and the pulmonary artery. Difficult or even inoperable conditions occurred in about 17 per cent. The aortic orifice was usually larger than the pulmonary orifice. Among adults with simple patency of the ductus women represent about three fourths of the cases. In atypical patency this sex ratio seems to be reversed. Analysis of the available data indicates that an attempt at ligation of the ductus is justifiable in spite of the absence of signs of decreasing adjustment to the defect. In adults difficult or impossible operative conditions will be frequent.

Patency of Ductus Arteriosus Complicated by Subacute Endarteritis—During the two and a half years following January 1940 Touroff has surgically treated 11 patients with subacute bacterial endarteritis involving a patent ductus arteriosus. Although not all the patients were cured the value of surgical intervention in properly selected cases was established. The ages of the 11 patients ranged between 9 and 63 years. 8 were women. In 10 the onset of clinical manifestations of infection and the time of operation varied between thirty-one (+) days and five months, in 1 the infection was present for two years prior to operation. Spontaneous pulmonary embolism prior to operation occurred in 5 patients. In 10 chemotherapy prior to operation was without significant effect. At the time of operation the blood cultures of all patients were positive for

Streptococcus viridans. The characteristic "machinery" murmur of patent ductus arteriosus was present in all. Several had additional soft systolic murmurs (at the apex or base) which were considered to be of little significance, in 2 characteristic murmurs led to the additional preoperative diagnosis of secondary, vegetative valvular involvement. Nine patients survived the operation and 2 died of operative hemorrhage. Of the survivors, 6 recovered from infection without benefit of chemotherapy and 3 did not recover from infection despite chemotherapy. Of the 6 who recovered, none presented evidence of preoperative spread of vegetations and after three to twenty-nine months all are well and their blood cultures have been repeatedly negative. Of the 3 who failed to recover, 2 had evidence of vegetative valvular lesions prior to operation and 1 was assumed to have vegetations at the aortic end of the ductus. One of these 3 patients died of subacute *Streptococcus viridans* endarteritis eight months after operation and 2 are unimproved fourteen and sixteen weeks, respectively, after operation. Ligation or division of the ductus, if performed before vegetations have spread to the cardiac valves or aorta, is an effective and safe method of treating subacute *Streptococcus viridans* endarteritis involving a patent ductus arteriosus. The operation should be done as soon as the diagnosis of superimposed infection is established. A patient with an acutely infected (*Staphylococcus aureus*) patent ductus arteriosus has been operated on successfully.

Electrocardiogram in Hyperventilation Syndrome W. P. Thompson Los Angeles —p. 372

Angiocardiography—Perez de los Reyes and his associates have employed angiocardiography routinely since 1937 in the examination of cardiac patients. It has proved harmless and its diagnostic value is superior to that of other methods. Angiocardiography utilizes the peripheral veins for visualizing the cavities of the human heart and their large communicating blood vessels. The method was devised with a view of establishing a correct diagnosis of congenital heart disease. Its two main stages consist in the introduction of a thin Lindeman trocar in a vein of the elbow, hand, leg or thigh and the injection of a radiopaque substance (not sodium iodide in a living subject) and exposure of the x-ray film at the end of the injection. From birth until the age of 6 months a 35 per cent solution of a radiopaque substance is used; from 6 months until 2 or 3 years of age the same solution may be used in non-cyanotic patients but in the presence of cyanosis the best concentration is 50 per cent. Injection of the substance must be completed as rapidly as possible and the roentgenogram made while the syringe still contains 2 or 3 cc. of the original 8 to 10 cc. of solution for a newborn infant, 12 to 20 cc. for an infant and 15 to 30 cc. for older children. The technic is easy and can be done wherever roentgenographic equipment is available.

Vital Capacity—Gross describes a new spirometric procedure of investigating the respiratory function. It adds to the factor of volume the factors of time and pressure. By measuring at the same time as the vital capacity the minimal duration or the quickest possible exhalation or a volume equal to the vital capacity the velocity of spirometric respiration is obtained by dividing the vital capacity by the expiration time. The velocity of spirometric respiration is that air volume which enters the spirometer per second. It represents the average of

the quickest possible expiration. Furthermore, the maximal expiratory pressure is measured, this corresponds to the respiratory movement and is, in a sense, identical with the vital capacity. The vital capacity (volume) and the expiratory pressure are independent of each other, whereas the velocity of spirometric respiration depends on the vital capacity as well as on the expiratory pressure. Any decrease in vital capacity that is caused predominantly by heart disease is characterized by prolongation of the expiration time, by decrease in the velocity of spirometric expiration and, above all, by decreased expiratory pressure which in typical cases sinks below half the standard value. Decreases in vital capacity that are caused primarily by pulmonary disease are characterized by prolonged expiration time, by decreased velocity of respiration and, most of all, by normal or hardly altered expiratory pressure. The decrease in expiratory pressure in cardiac insufficiency is explained by a diminution in the strength of the respiratory muscular apparatus. The fact that a person has a normal vital capacity does not prove that he has a normal respiratory function. Other factors such as time, velocity and expiratory pressure, must be considered.

Effect of Lanatoside C on Failing Heart—According to La Due and Fair the intravenous administration of Lanatoside C to patients with heart failure and normal sinus rhythm usually increased the pulse pressure and reduced the circulation time and venous pressure within two hours. Roentgenkymographic studies of the hearts of 10 such patients showed that the drug significantly reduced the diastolic heart volume of 5 and increased the stroke output of 8. In 2 patients the minute volume of the heart was so great before the administration of the drug that no decided increase could be expected. In the 8 patients in whom the cardiac output, the product of the stroke output and the mean blood pressure was definitely increased, the diastolic heart volume was decreased or unchanged. Since the diastolic heart volume is an index of oxygen consumption, these increases in work which followed Lanatoside C must have represented proportional improvement in the mechanical efficiency of the heart of 8 of the 10 patients. Seven patients who were studied after compensation was established showed a decrease of 200 cc or more in the diastolic heart volume. In 4 the minute volume was greater than at the start of the experiment and in 3 it was less. The most consistent and lasting change produced seemed to be a decrease in the diastolic volume of oxygen consumption.

Chemotherapy of Chronic Ulcerative Colitis—Sulfathiazole, sulfaguanidine and sulfadiazine were used by Mills and Mackie in the treatment of 109 unselected cases of acute and fulminating to chronic ulcerative colitis from the clinic of the Roosevelt Hospital. Thirty-six patients were treated with only one drug. Sulfathiazole employed in 59 proved most effective in acute cases. Of the 59 patients with the disease in the acute, active, chronic, recurrent and convalescent stages

treated with sulfathiazole 23 were decidedly, 23 definitely and 8 were not improved, 5 were intolerant to the drug. The doses employed included 6 Gm divided into six equal doses for several days, this was reduced to 4 Gm in twenty-four hours. The average total dose administered was 40 Gm per patient. The respective figures for the 71 treated with sulfadiazine were 35, 21, 9 and 6, and for the 91 given sulfaguanidine they were 41, 34, 11 and 5. The present status of the 109 patients is as follows: 15 have been in a sustained remission of the disease for six months to two years, in 35 the disease process is quiescent both on proctoscopic examination and symptomatically but these patients are still on active therapy, 25 are on active therapy with continuing improvement in their disease, 17 are unimproved, 7 have had ileostomies, 4 are dead and the present status of 6 is unknown. The better results occurred in patients without severe and irreversible pathologic changes in the colon.

Ornithosis (Psittacosis)—Favour has encountered 1 mild, 1 severe and 1 extremely severe case which he has been able to identify as probable ornithosis (psittacosis) by the complement fixation test. Other cases with parallel clinical courses but not due to the virus of ornithosis, suggested close similarity between ornithosis and atypical pneumonia. The 3 cases of ornithosis were observed in the course of eighteen months. Careful questioning of patients with atypical pneumonia about contact with varieties of birds known to harbor the virus and complement fixation tests on acute and convalescent sera should be performed as a diagnostic routine. Atypical pneumonia in patients from whom no etiologic agents have been isolated may be due to a virus of the psittacosis group which has become fixed and is usually incapable of heterologous parasitism. The cases presented are of further interest because a number of animal inoculations did not differentiate ornithosis pneumonia from the human type of virus pneumonia. In the assistance of Dr. K. F. Meyer's laboratory, where the psittacosis complement fixations were done, had not been obtained the cases might have been regarded as human virus pneumonia and the fact would have been missed that ornithosis is probably not a

more common than is suspected. The history of contact with birds was always obtained from the patient; the history was sought chiefly because the hospital staff had been awakened to the ornithosis problem by a visit from Dr Meyer.

High and Low Doses of Sulfadiazine—Eighty-one unselected adults with typed pneumococcal pneumonia were treated by Dowling and his colleagues with an initial dose of 2 Gm of sulfadiazine followed by 0.5 Gm every four hours until recovery was certain or death ensued and an alternate group of 79 with 6 Gm initially followed by 1 Gm every four hours. There was no significant difference in mortality or in the incidence of serious complications in the two groups. In the second group there was a slight tendency for the temperature to fall more rapidly than in the low dose group. The hospital stay for the patients receiving the larger doses averaged three and two-fifths days less than for the low dose group and the incidence of relapse, spread of the pneumonia to another lobe and slow resolution in the high dose group was less than half that in the low dose group. Toxic reactions were infrequent in both groups. Although the higher doses appear slightly more effective definitely smaller doses than are usually recommended can be used without fear of an increase in the mortality rate or of serious complications. At present this is significant as the supply of the sulfonamides may become limited.

Studies of B Vitamins in Man—The experience of Machella and McDonald in the treatment with riboflavin of some of the lesions of 20 patients attributed to its deficiency has been as follows. Cheilosis has not healed with the administration of riboflavin alone but from the observation of others it has become evident that the administration of tractions or the B complex other than riboflavin may be accompanied by healing of the lesion. They have had no significant experience in the treatment of the lesions of the face that have been ascribed to a deficiency of riboflavin. Its administration to 3 patients with acute and to 1 with chronic pemphigus brought about no improvement in the character or decrease in the number of the lesions. The results of treating keratitis of 9 patients with riboflavin were disappointing; only 1 of them experienced permanent subjective improvement. The cutaneous rosacea of 5 patients with rosacea keratitis was uninfluenced by the vitamin. In none of the 6 patients with a purple red or magenta tongue and with flattened or mushroom shaped filiform papillae who were treated with riboflavin were the changes of the tongue significantly altered by the vitamin. In 4 a return to normal occurred after medication with brewers' yeast, in 1 after pyridoxine was administered and in 1 the opportunity to observe the results of vitamin therapy other than riboflavin was not afforded. The conflicting data in the literature and their personal experience make the authors doubt the validity of the syndrome ariboflavinosis.

Bilateral Partial Bundle Branch Block—Strauss and Langendorf report a case of sinus rhythm with intraventricular block which showed variations of the ventricular complexes between the common and uncommon types. This change was associated with advanced partial auriculoventricular block. The alternations are explained by assuming partial block in the two main bundle branch systems with a shorter relative retractor phase of the bundle branch which has the longer absolute retractor phase. When a thorough examination of the conduction system in cases of intraventricular block is made bilateral involvement might become more frequent than heretofore expected.

Multiple Bilateral Pulmonary Adenomatosis in Man—Sims reports an instance of pulmonary adenomatosis in man which resembled the disease jagzickte of sheep. Current opinion suggests that jagzickte is an infectious disease possibly of virus origin. A few similar cases in human beings have been reported previously. The possibility that this lesion as seen in sheep possesses neoplastic characteristics as well as transmissibility must be considered. Further investigation to establish the identity of the condition found in man with that found in sheep is indicated.

Hemolytic Streptococci in Certain Army Camps—Schwenker states that during the winter of 1941-1942 a total of 5405 throat cultures were made at four army posts. 158 of patients 674 of ward contacts and the others of normal carriers. The object was to obtain preepidemic data for comparison with similar studies in the event of an outbreak of streptococcal infections. At first only sporadic cases occurred but in February an epidemic occurred in one of the posts. At this post a single type of streptococcus caused most of the cases but at other the sporadic endemic cases were not caused by any principal streptococcus. Also the incidence of the various types of streptococci among normal carriers was similar. There was a definite relationship between the streptococcus carrier rates in a community and the incidence of scarlet fever. The logarithm of the morbidity varied directly with the carrier rate. This relationship held for the gross and group A rates and for the scarlatinal type since the three rates roughly paralleled one another. Changes in the gross carrier rate were due to variations in the group A rate which in turn were dependent on the changes in rate for the scarlatinal type. During ward outbreaks

of scarlet fever the scarlatinal strain of streptococcus became distributed throughout the inmates in varying degree. Depending on the degree of distribution, it failed to reach a certain proportion of the men, these remained well. Some of the others who came in contact with the scarlatinal strain were resistant to the organism, probably because of an antibacterial immunity. Regardless of their Dick reaction, they remained well and either promptly eliminated the streptococcus or became normal carriers. Those without antibacterial immunity became sick. Scarlet fever developed in the Dick positive individuals, while those who were Dick negative had streptococcal tonsillitis without a rash.

Prophylactic Use of Sulfaguanidine in Dysentery Outbreak.—Lucchesi and Gildersleeve used sulfaguanidine prophylactically and therapeutically during an outbreak of bacillary dysentery among 118 children confined to bed with scarlet fever. The children in one part of the hospital were in danger of developing dysentery superimposed on the scarlet fever. For this reason, of the 45 children in this half of the building 30, being from cubicles in which a case of dysentery had developed, were given a prophylactic course of sulfaguanidine 0.05 Gm per kilogram of body weight every four hours for one day and then every eight hours for two days. Dysentery did not develop in any of the 45, 1 patient had a slight fever with four stools two days after the institution of sulfaguanidine but mucus, blood or dysentery organisms were not seen. The other wing of the ward was considered protected by its segregation from the infected wing and these patients were not given a prophylactic course of the drug. Dysentery did develop during the succeed-

ing five days in 4. These patients were immediately treated with sulfaguanidine and no further spread occurred. A total of 29 children between 2 and 12 years of age were treated. All had fever, diarrhea and mucus in the stools and usually blood and pus as well, but the dysentery organism was isolated only from 4. The clinical diagnosis was confirmed in 25 by the demonstration of antibodies during the convalescent period. The initial dose was 0.1 Gm per kilogram of body weight administered orally. This was followed at intervals of four hours by 0.05 Gm per kilogram until formed stools had been present for one to two days. Two patients had a mild relapse after the drug was discontinued. Relief was prompt on its readministration. Toxic reactions were negligible. Dietary treatment of all cases consisted of weak tea, ripe banana, scraped apple, fruit juices and, in a few cases, a kaolin-pectin mixture.

Movements of Human Stomach.—Anderson and Morris observed the action of various drugs on the motility of the fasting human stomach. Atropine in small doses had a parasympathetic action which increased the frequency and amplitude of the hunger contractions and slowed the pulse rate. Such a dose also had a sensitizing effect whereby an antipara-sympathetic action was obtained from a second small dose. Large doses inhibited the movements of the stomach and quickened the heart rate. Prostigmine had an excitatory effect on gastric motility. Premedication with atropine did not change this action. If given in large doses, the atropine may prevent the stimulating effect of the prostigmine. The effects of atropine were not altered by the previous administration of prostigmine. Epinephrine in small doses occasionally increased gastric motility. Large doses had a sedative action. Calcium had a sedative action on the fasting contractions of the stomach and slowed the pulse rate.

Activity of Sulfapyrazine.—The activity of sulfapyrazine against infections with beta hemolytic streptococci was compared by Schmidt and Sesler with that of sulfadiazine, sulfathiazole, sulfapyridine and sulfanilamide. Sulfapyrazine was usually considerably more effective. The data suggest that the superior activity of sulfapyrazine, and also of sulfadiazine, over equal doses of other sulfonamides is due to the absorption and excretion characteristics of the two drugs, which permit the maintenance of effective concentrations in the blood between treatments. The activity of all five drugs was essentially the same when the average concentrations in the blood were the same.

*Beneficial Effect of Urea in Topical Sulfonamide Therapy I Treatment
of Infected Dermatoses II Effectiveness of Urea Sulfonamide Com-
binations in Sulfonamide Resistant Infections E A Strakosch and
W C Clark Minneapolis—p 276
Treatment of Craniocephalic Injuries in Modern Warfare G S Baker
and A W Adson Rochester—p 282

Effect of Urea in Topical Sulfonamide Therapy—
Strakosch and Clark demonstrated that low concentrations of
urea exert a synergistic action with sulfonamides on *Escherichia*
coli in a synthetic medium and also neutralize the sulfonamide
inhibitory action of methionine and para-aminobenzoic acid.
Urea offers advantages over certain other substances, such as
azochloramid, which neutralize the sulfonamide inhibitor action
and enhance the bacteriostatic action. Twenty-eight instances
of bilateral dermatosis due to staphylococci and/or streptococci
were treated with a urea-sulfathiazole mixture. Each acted as
its own control, one side was treated with a urea-sulfathiazole
mixture and the other with a 5 per cent sulfathiazole ointment
or solution alone. Treatment was applied in the form of an
ointment consisting of 5 per cent of sulfathiazole and 30 per
cent of urea in a base of fatty esters of diethanolamine mixed
with petrolatum, in the form of wet packs of a solution consist-
ing of two parts of water in which was suspended a powder
mixture of 70 per cent of urea, 20 per cent of lactose and 10 per
cent of sulfathiazole or in the form of a mixture of urea and
sulfathiazole in powder form. The condition of only 5 of the
28 patients was not definitely benefited by the urea-sulfathiazole
mixtures as compared with the sulfathiazole alone. In 1 of
the 5 the condition was borderline, treatment in 1 was discon-
tinued because of the caustic action of the sodium salt of sulta-
thiazole and in 3 the causative organisms may have varied in
their response to urea-sulfonamide therapy under the present-
ing clinical conditions. In 2 cases of widespread pyoderma
with organisms which were coagulase positive and hemolytic
Staphylococcus aureus both of which were decidedly sulfon-
amide fast by *in vitro* tests, topical treatment with urea-sulfon-
amide combinations proved effective after sulfonamides alone
were ineffective. Strong urea therapy should be discontinued
when fresh uninfected granulation tissue appears as animal
experiments on cutaneous defects and some clinical experience
show strong urea to be inflammatory. New granulation tissue
contiguous with infected areas, may be protected from continued
urea treatment with ointment.

- Protecting the Newly Born Infant from Tuberculosis P J White
St Louis—p 61
*Pathogenesis of Jaundice of Newborn Infant P G Danis St. Louis
—p 62
Diarrheal Diseases in Newborn Infant M M Cook St. Louis—p 64

Pathogenesis of Jaundice in Infancy—Danis points out
that jaundice of the newborn infant may be caused by infections.
A test for syphilis is indicated on every mother of a baby with
jaundice. When the jaundiced baby has a fever a blood culture
always should be taken. Septic jaundice and syphilitic
jaundice are associated with acute hepatitis but today these
cases are rare as aseptic deliveries are done on thoroughly
examined expectant mothers. It is the baby of a woman with
streptococcal nasopharyngitis in whom sepsis develops. Fever
or jaundice of the newborn infant indicates the need for a blood
culture. Obstructive jaundice of the newborn comes on slowly

after the first five days of life. It presents much the same
picture as that produced by tumor or stone in the adult. It
develops slowly in the newborn period with relatively few
symptoms associated with it during the first week. After a
rather protracted course death is inevitable, as rarely are any
of the ducts patent. Sometimes the ducts from the liver to the
gallbladder are open and cure may be brought about by an
anastomosis of the gallbladder to the duodenum or stomach.
In erythroblastosis lies both the simple so-called physiologic
jaundice of the newborn and the serious syndrome best known
as icterus gravis (erythroblastosis fetalis). The first, occurring
not earlier than the third day and not later than the fifth, is
called physiologic jaundice because of its frequency and its lack
of seriousness. However its frequent presence in the weak
and premature does not justify the term physiologic. Some
slight hepatic insufficiency must be present. The result is an
inability to handle the biliary pigment produced by the destruc-
tion of the unnecessary abundant cells in the baby's circulation.
When this comes to an end the condition improves. Hemolytic
jaundice occurring before the second day of life or even at
birth, after sepsis and syphilis have been ruled out, strikes a
more serious note, as does jaundice which continues to increase
rapidly in intensity or fades only to be replaced by extreme
paleness. The incidence of and mortality from fetal erythro-
blastosis would be reduced if more attention was given to the
icterus of the newborn.

Chronic Bacillary Dysentery—Silverman and Friedrichs
state that in New Orleans the prevalence virulence and inci-
dence of complications of bacillary dysentery have increased.
Strains of the original Shiga bacillus and of the Flexner type
are encountered more frequently. The lactose fermenter reported
ten years ago is now an unusual finding in chronic bacillary
dysentery. The increase in incidence and virulence of bacillary
dysentery in this and other sections of the country assumes
particular significance in view of the aggregation of great
numbers of men in the different camps and the various com-
munities. The possibility of this infection spreading from a
local community to camps is great. Close vigilance should be
observed and if dysentery should appear the patient should be
isolated and every effort made to prevent the spread of this
extremely serious disease.

administration were uncommon and never serious. There was no evidence that tolerance to the drug might develop, but a slight danger of addiction has been reported. Demerol given by injection in a few cases seemed to be more effective than by mouth.

Effect of Demerol on Pain in Neurologic Cases—

According to FitzGerald and McArdle Demerol became available in Britain under the name of pethidine in 1941. They gave it to 12 subjects selected as having severe pain arising from diverse neurologic conditions. Some had pain of peripheral origin such as radial neuritis, brachial neuritis, supra-orbital neuralgia, trigeminal neuralgia or sciatica; others had pain of central origin as in thalamic syndrome, painful phantom limb or tabetic crisis, and still others had undergone operations for injection of the gasserian ganglion or had a headache from lumbar puncture or encephalography. To some patients the drug was given intravenously, to others subcutaneously. The response to Demerol was excellent in 8 of the 12 cases; in 3 the relief was considerable although the pain was not entirely abolished and the duration of relief was not beyond four hours. The only patient who did not obtain any appreciable relief was a highly emotional subject who had been accustomed to considerable amounts of opium and rather resented being given a different drug. Adverse side effects—which ranged from transient giddiness to pallor, faintness, sweating, blurring of vision, nausea, tremulousness and anxiety—were noted in 7 of the 10 cases in which Demerol was employed intravenously. Though objectionable, these features were transitory in all but 2. It has been possible to compare the relief gained with Demerol with that following morphine in 7 cases. Morphine gave considerable relief but it was less definite and of a shorter duration than that following Demerol.

Anthiomaline in Venereal Lymphogranuloma—Law reports that 220 cases of venereal lymphogranuloma were treated during eighteen months among both British and African troops in West Africa. The lesions with three exceptions were genital and inguinal in situation and were less extensive than in the female. Cases of rectal involvement with stricture formation were not seen. The primary lesion is small, painless and transitory and is often overlooked; it may accompany other venereal infections. The value of the Frei test in diagnosis was confirmed. In some cases there was spontaneous resolution of the buboes. Anthiomaline (lithium antimony thiomalate), an organic compound containing 16 per cent of antimony, was administered intramuscularly or intravenously. Injections were made two or three times weekly, beginning with 0.5 cc and increasing by 0.5 cc up to 2 cc for a maximum of twenty injections, which should be equivalent to 0.2 Gm. of antimony metal. When anthiomaline was not available, sodium antimony tartrate was injected intravenously as a freshly prepared 1 per cent solution in distilled water. A total of 137 cases were treated by chemotherapy. The average number of injections was ten, and the average time was a little over three weeks. It is advisable to administer eight or more injections even if the lymph node swelling has subsided on a smaller dose. Exacerbation or recurrence of the bubo may occur if treatment is discontinued too early. For comparison a series of cases was treated with sulfanilamide administered by mouth in tablet form. First stage cases responded quickly but no more rapidly than to the antimony therapy. No real advantage could be claimed for this treatment. Some patients were subjected to lymph node excision. In the first stage such treatment was effective. To compare chemotherapy with surgical excision, 1 patient was subjected to excision from the right groin and to anthiomaline injections on the left side. Block dissection was carried out. The wound healed by first intention but subsequently the scar became keloid in part, whereas the left inguinal glands subsided without complications.

Heart Lesions in Pneumonia—Spühler studied cardiac lesions in cases of pneumonia. He describes 6 selected cases. Case 1 is characteristic of the course of a temporary impairment of the myocardium. Few clinical signs of cardiac impairment were present but the electrocardiogram revealed a myocardial lesion. In case 2 pneumonia was followed by a continuous polytopic ventricular extrasystole. It must be assumed that in such cases myocardial scars have developed and that they are the point of origin of the extrasystoles. They are residues of a mild focal myocarditis. That pneumonia may result in severe myocarditis is demonstrated by case 3, in which there was acute decompensation, enlarged liver, edema of the legs and beginning pulmonary edema. Pericarditis is a frequent complication of pneumonic myocardial impairment. The fourth case was one of a severe pericarditis which terminated in death. Cases 5 and 6 are examples of postpneumonic cardiac impairment. Retardation of the atrioventricular conduction and blockage in the right branch of the stimulus conducting tissue developed in 1 of these. Chronic myocarditis and endocarditis developed in the sixth case. In the majority of cases of pneumonia changes are present indicative of cardiac damage, but these are usually temporary in nature. Serious irreparable damages are possible; there may be a permanent retardation of the conduction branch block and cardiac dilatation. Pericarditic and endocarditic involvement are sometimes observed.

Pulmonary Roentgenographic Aspects of Osteoarticular Tuberculosis—P. Guillen—p. 9.

Pulmonary Roentgenographic Aspects of Osteoarticular Tuberculosis—Guillen studied roentgenograms of the lungs of 29 children with osteoarticular tuberculosis. The process involved the spine in 8 cases, the hip joint in 9, the knee joint in 10 and the hands and feet in 1 case each. The roentgenograms indicated that the hematogenic dissemination of the tuberculous process from the osteoarticular foci takes place during the period of secondary tuberculous invasion of the lung. The pulmonary and extrapulmonary lesions run a parallel course either toward healing or toward progression.

Elimination of Androgens in Urine—Lacaz de Moraes made quantitative determinations of androgen elimination in the urine of 20 normal adults and in a group of patients with Cushing's syndrome, adipo-ogenital dystrophy, hypophyseal tumor, pseudohermaphroditism, hypersexuality, homoeruality and after castration. Utilizing the Zimmerman Evelyn colorimetric test, he found that the amount of androgen excreted was between 116 and 137 mg. of the substance for each liter of mixed urine of normal adults, between 106 and 195 mg. in the urine of patients with Cushing's disease, 138 mg. in adipo-ogenital dystrophy, 6 mg. in pseudohermaphroditism, in men, 196 mg. in hypophyseal nanism, 0.665 in the urine of castrated men, between 75 and 19 mg. in hypersexuality and 0.54 mg. in homoeruality.
